[Very good crop: 14 tons per acre.]			

POTATOES.—2 rods, chalk and clay.

28 lbs. sulphate of soda	£0	2	0
7 ,, saltpetre	0	1	9
28 ,, gypsum	0	0	6
[Exactly double the quantity of the adjoining 2 rods; both had a similar quantity of dung under them; the mixture was strewn on the leaf; 1st had 3 bushels; 2d had 6 bushels.]	£0	4	3

ON THE APPLICATION OF CHEMISTRY TO AGRICULTURE UPON RATIONAL PRINCIPLES.—No. XV.

(*Continued from* p. 267.)

Carbonate of ammonia is volatile, and is lost during the decomposition of animal matter, urine especially. In order, then, to retain the nitrogen in the liquid, we must either prevent the formation of the carbonate, or we must change it when formed into the sulphate or phosphate, which are not volatile. If sulphuric acid is added to putrefying urine, the carbonate of ammonia is decomposed by the sulphuric acid uniting with the base (ammonia), and forming sulphate of ammonia, the carbonic acid being given off with effervescence. Sulphuric acid is formed of—

Sulphur	16	one equivalent.
Oxygen	24	three equivalents.
	40	

And sulphate of ammonia of—

Sulphuric acid	40	one equivalent.
Ammonia	17	one equivalent.
Water (hydrogen 1—oxygen 8—9)	18	two equivalents.
	75	

which, accordingly, is the combining proportion of sulphate of ammonia.

I have adduced those instances to show how beautifully simple is the law of chemical combination. To a person entirely unacquainted with chemistry, they will demonstrate the truth that the statements of chemists are not deduced from fanciful theories, but are the result of sound induction from uncontrovertible fact.

By a reference to the above figures it will be seen that the relative proportions of ammonia and sulphuric acid in the sulphate, are as 17 to 40. Thus, if in an experiment with sulphuric acid as a fixer of carbonate of ammonia, 40 oz. of acid are used, the experimenter knows from the above law of combination, that 17 ounces of ammonia, 40 ounces of sulphuric acid, and 18 ounces of water will be united together in the form of crystallised sulphate of ammonia, and that the result will be 75 ounces of that salt. If these 75 ounces of sulphate are applied as a manure, the result must be calculated from 17 ounces, if the effects of ammonia are to be proved. But it must be remembered that sulphuric acid contains another singularly constant constituent of albumen, viz., sulphur; and, therefore, sulphuric acid undoubtedly will in this way often act as an efficient manure.

But there is still another mode in which sulphuric acid acts as a manure, in addition to those stated. The inquiries of Liebig render it more than probable that the carbonate is the only salt of ammonia which is appropriated by the plant. Therefore, the sulphate is decomposed in the soil by re-acting upon chalk, and forming, by an interchange of elements, carbonate of ammonia and sulphate of lime, which is so well known as gypsum. Now, gypsum has the power of absorbing carbonate of ammonia just as charcoal does carbonic acid. The sulphate of lime thus formed then becomes a constant reservoir of carbonate of ammonia, which it gives up to the plant. Much discussion has arisen about the *modus operandi* of gypsum, but the above, suggested by Dr. Carpenter, in his "Popular Cyclopædia," appears to be the most rational, and the

most easily reconcilable with the well-known chemical fact, that sulphuric acid has a greater affinity for lime than for ammonia. Whichever view of the case is correct, the utility of gypsum as a manure rests upon evidence too conclusive to admit of doubt. The value, then, of sulphate of ammonia as a manure is very great, always bearing in mind that it must be used in combination with the other elements of plants; and that, given alone, its effects will only be perceptible in proportion as those other elements are present or absent from the soil; and also remembering, that being an azotised manure, it will have a much greater influence over a corn than a root crop.

Having settled this point, our next inquiry is the source from whence the farmer is to obtain a supply of this valuable manure. He has it in soot, but the supply of this article is limited: he has it in Peruvian guano, but this is expensive. The ingenuity and enterprise of Mr. Potter has brought it into the market in large quantities in the form of "Potter's Guano," which is allowed to be the best of all the artificial manures. But the farmer can procure for himself, at little cost or trouble, any quantity of this manure, by the action of sulphuric acid upon urine, or gas-water. Of the latter I shall say nothing, because the supply is naturally limited to large towns; but the former is within the reach of every one, and by its means the farmer can make extemporaneous guano in any quantity he chooses.—*C. R. Bree, Stowmarket.*

Home Correspondence.

Prevention of the Attack of Fly on Young Turnips.—In 1815, I sowed a richly manured field with Turnip seed; the plants at first looked well and thriving, but soon disappeared. The flies were numerous. My second sowing exactly resembled the first; I sowed for the third time, but the season being too far advanced, a poor crop was produced. This unfortunate year led me to make many inquiries, the answers to which are not worth recording. In 1816, the weather was more favourable for our hot stone-brash land; part of my seed was drilled, part sown broadcast; a tolerable crop appeared, but the fly began their attack. Fearful of these destructive insects, I tried different experiments copied from the newspapers, but all were useless. It now occurred to me that a practice which my father formerly adopted with respect to his Cabbage plants might be successful with the Turnips likewise. I began his plan of sowing lime over the plants; and wherever the lime had been dusted, which was in several parts of the field, not one was touched. Year after year I followed up this system, extending my experiment over a large portion of the field, till I found it to answer so completely that I adopted it altogether. But the difficulty of sowing riddled lime upon a large scale now appeared a considerable obstacle. It was a tedious task, and also one which the men set about with great reluctance, as from the heat of the weather and the nature of the lime, their hands were burnt, and in other respects they were greatly inconvenienced. I now turned my thoughts to a machine; my first efforts failed. I persevered, however, year after year, till I completed a machine to my satisfaction, which will sow any given quantity of lime. Four or five days after sowing, should vegetation be quick—the Turnips will begin to appear. Swedes, however, are a day or two later; let the field be examined without fail, every morning, and as soon as there appears a sufficient crop, the lime must be applied. It will not do to wait till all are up, as by this delay the whole may be lost, owing to the great rapidity with which the fly destroys the crop when they once attack it. It must be remarked, that the fly and other insects devour the Turnips as soon as the plant comes up, before the first two leaves can expand. I mention this circumstance as proving the necessity of losing not a day. Lime for dusting the Turnips should be procured some time previous to sowing; let it be kept in the dry; a few days before it will be wanted, let it be slaked and riddled into carts, thus, probably, it will not interfere with the business of haymaking in which the farmer is then engaged. My proportion of lime is six bushels, measured before slaking, to an acre. It must be remarked, that I sow it only on the rows, my system being the drill, but I calculate ten would be sufficient for a broadcast acre with my machine. Hoers can, with much greater accuracy, perform their work in a drilled crop. Another disadvantage of the broadcast system is, that the hoeing cannot take place so soon by five or six days as with a drilled piece. I here subjoin a calculation of expenses for dusting with lime ten acres:—

	£	s.	d.
Eight quarters of lime	0	16	0
Carriage	0	5	0
Two men, slaking and riddling	0	3	0
Beer	0	2	0
Horse, for sowing the lime	0	4	0
One boy, for ditto	0	1	0
	£1	11	0

I would employ, on a large farm, two machines, two horses, and two boys—one to fill the boxes, whilst the other is working the machine. I beg to add, that more than ten acres could be dusted in one day of eight hours by my plan, with one machine, and eighteen or more with two machines.—*Forehead Singer, Frome.*

Pond Water.—Water in a state of fermentation caused by the presence of vegetable matter, must be unwholesome, and tend to produce disease; but after this has ceased there is no reason why the water should be injurious. I have often seen, and been surprised, at horses and cows preferring to drink from the pond in a farm-yard or field, instead of quenching their thirst at a running brook. Donkeys, however, show a more delicate taste, and go to the clear stream. The Thames water which is used on board a ship, putrefies in the cask before it becomes fit for use. After it has gone through a process of this description it is considered the best water for a voyage. If opened before it is perfectly settled, after being sick, it is dangerous, and requires a strong stomach fortified by brandy or rum to swallow the high smelling beverage. Is not this somewhat analogous to the pond?—*Falcon.*

Equivalent Values of Food.—In No. 12 *Ag. Gaz.*, the value of Pea-straw, in comparison with Hay, in point of nutriment, is mentioned. Professor Johnson, in his "Agricultural Chemistry," has given the following table of equivalents, which afford equal nourishment to animals, and may be interesting to some of your readers, if you think fit to insert it. He takes 10 as his standard for Hay, and sometimes gives a varying equivalent.

	Pounds.		Pounds.
Hay	10	Carrots	25 to 30
Clover Hay	8 to 10	Turnips	50
Green Clover	45 „ 50	Cabbage	20 „ 30
Wheat-straw	40 „ 50	Peas and Beans	3 „ 5
Barley-straw	20 „ 40	Wheat	5 „ 6
Oat-straw	20 „ 40	Barley	5 „ 7
Pea-straw	10 „ 15	Oats	4 „ 7
Potatoes	20	Indian Corn	5
Old Potatoes	40	Oil-cakes	2 „ 4

—*J. B. N.*

Incendiarism.—It has often occurred to me that if parties who have insured their property, would be at the trouble of placing, in a conspicuous part of their farm-buildings, "the stamped tins" usually given by the Insurance Companies, there would be less likelihood of incendiarism, as they would, if observed, show how little would be accomplished by the act.—*Ganstead.*

Earth as Food.—A short time since a cow which I had kept during the winter in-doors, got loose, and the first thing it did was to go and eat a quantity of garden-mould. It appears to me that we may obtain a valuable hint from this fact; the natural mode of feeding of the cattle is likely to bring up a quantity, more or less, of earth with the herbage, and this may be as useful to the cow as the ashes recommended in your last Number, are to the pig.—*Toby.*

How to destroy Rabbits.—Sow the headlands of the fields adjoining the woods, and any odd corner in the neighbourhood, or plant the banks of hedge-rows and sides of ditches with rape; every young one that eats of it will become diseased (pot-bellied), and if it be a wet season, will die of the complaint in the liver similar to the rot in sheep. If a few old males are put for about a week into a stable on straw, where a thoroughly-mangy dog has been confined, they will be fully inoculated with the complaint, and when turned out again will spread the malady to the whole warren, thus rendering the skins of the animals valueless; which will, I dare say, be alone sufficient to bring a bad neighbour to a sense of justice, for most likely the keeper is paid by the rabbits fed at other people's expense. I once threatened these measures, and was laughed at; but in a year I had the laugh on my side; an impudent keeper was discharged; I had a liberal allowance for damage, and made a friend of a very bad neighbour. I consider rabbits the greatest enemy the landlord has; they make tenants dissatisfied, they tempt idle boys into their first trial of poaching, and their first theft of their employer's rat-trap; then comes the lying out at nights to watch their ill-gotten property, the disposal of it to publicans for spirits, followed by an introduction to older thieves and ruin. But they are also game destroyers, by enticing cats, the very worst of poachers, from great distances, and which never leave off night hunting, however well fed at home; as for amusement, they will kill young pheasants and partridges when they know their way to the woods. I have killed them ten miles from the house in which they had been fed on the same day. Fox-hunters preserve rabbits in hopes of feeding them; but poachers will set traps for profit, villagers in their gardens for self-defence, and many a cub has in consequence been caught and buried, causing blank days and loud complaints of ill-preserved covers; so that in all cases they are worthless.—*A Sportsman.* —— Another correspondent, *Mudie*, states the following as a means for destroying rabbits: "1. Large vermin-traps—the Norfolk (so called), are best, baited with their most favourite food, Carrots cut up and laid over them. 2. Carrots cut and laid in small heaps in the underwood after having been steeped in a solution of arsenic for 42 hours, but I fear the poor picking up the poisoned ones and eating them. 3. Turn into their burrows from six to a dozen ferrets, and let them run wild. 4. Burn sulphur in their burrows and stop them."

Guano.—In the latter end of December, 1842, I ploughed a lea-field, and sowed it with Wheat; and in the month of May following, it looked stunted and bad. At this period I sowed over it guano at the rate of 2 cwt. to the acre, and in 14 days an entire change had taken place, the Wheat looking green instead of yellow. It continued for some time to improve, and every little piece that was missed in the manuring was seen from the opposite hill; and I am sure, from the application of this manure (costing about 30*s.*), the crop was improved full 30 per cent. Guano had the same effect on Barley on a light soil, and a piece of Oats on a stiff clay soil. In the second week of May last, I tried it in a field of Grass, using 3 cwt. per acre against forty tons of Devonport dung; and I can be positive in stating that the part on which the guano was used produced a far better crop of Grass than where the dung was used. I have found guano very useful as a liquid manure. I have dissolved it in spring water at the rate of 1 lb. to 3 gallons for 24 hours, which has produced a fine piece of Grass; but the best and most convenient plan is (where persons possess tanks for containing the liquid manure from the stables, &c.) to put it in the tank, about 1 lb. guano to 8 gallons of water. This I found to produce a most excellent crop of Grass, which was in six weeks sufficiently high to mow. I likewise sowed a field of white Turnips, one part with dung, the other with guano, 2 cwt. per acre. The guano produced a much better crop than the dunged part, allowed to be the case by several farmers who saw the field.—*William May, Saltash.*

Yew.—Seeing in your Paper some remarks made by a correspondent on the poisonous effects of Yew eaten by cattle in a withered state, and the harmlessness of the same plant if eaten green from the living tree, I am induced, for the benefit of your readers, to offer facts on this subject which have come under my observation. About 12 months since, one of our team-men turned out in the morning with four young good-constitutioned horses to harrow some ground, and having occasion to get his harrows from an adjoining field, across a cart-road, before he could commence work, he incautiously allowed the horses to nip off and eat the most tender living shoots of two bushy young Yews, growing close by; in a few minutes, however, he had them all regularly at work, and nothing unusual occurred for about two hours, when one of the horses suddenly dropped down dead. Being in the field, and not knowing the cause of this catastrophe, I ordered the horses to work a distance off while the dead body was being flayed; but I had not got far on my road to the collar-maker before another horse fell dead suddenly as the other. I was then informed by the man that the horses had been cropping off the tops of the living Yew-trees; we got the other horses home speedily, and administered liberal doses of castor oil, which I supposed proved a good antidote, as they showed no symptoms of hurt afterwards. An experienced farmer, now by my side, bears testimony to the same effect (from what has come under his particular notice) of valuable horses being destroyed from the same cause, under somewhat similar circumstances.—*George Crompton.*

On Marl as a Manure.—Most farmers are aware of the value of marl as a manure on light soils, but it is not so generally known how to apply it to the greatest advantage. It is never safe to make use of marl which has not been analysed, until it has been burned. This process is too well known to need description, I will, therefore, confine myself to stating, as briefly as possible, the reasons which render it necessary. On a late visit in Cheshire I ascertained from the actual experience of many of the farmers of that county, that some descriptions of marl have a tendency to destroy a good soil altogether. At first, I was inclined to believe that this was owing to the mode of its application, which consists in strewing it over the meadows, or arable land, in large moist lumps. It was quite clear to me that such an application must tend to injure the land by excluding the air; but I could hardly think that this could be the sole cause. To ascertain this, I took from the pit a piece of the marl for the purpose of analysis; and on investigation I found it to consist of 60 per cent. of alumina, 30 per cent. of sand, 5 per cent. of gypsum, 2½ per cent. of red oxide of iron, 1 per cent. of protoxide of iron combined with sulphuric acid, and a very perceptible quantity of potash. Now, it is evident that the only substance contained in this marl, which could prove pernicious, was the protoxide of iron, the baneful effects of which on vegetation have been distinctly proved. We know that plants cannot live in soils devoid of oxygen; if, therefore, a salt is present, which consumes all the oxygen of the soil, the roots of the plants will necessarily be deprived of it. Such being the case with all soils containing the sulphate of protoxide of iron, barrenness is the natural consequence. Another cause of barrenness is the putrefaction of vegetable remains in soils in which no oxygen is present. Putrefaction being a highly deoxidising process absorbs the oxygen from all bodies capable of yielding it, thus converting red oxide of iron, a useful ingredient of a soil, into protoxide of iron, which is a deadly poison to plants. I have found that all marls which tend to destroy the fertility of a field, contain protoxide of iron, and the only remedy consists in thoroughly burning the marl which does so contain it. For fields, which have been rendered barren by this means, the only remedy is frequent ploughing and mixing with burnt lime.—*A. Bernays, Manchester.*

On Guano.—The value of guano as a manure is now pretty well established, and it has been owing solely to the high price of the Peruvian guano that it has not been more generally used. It has been asked whether it does not impoverish the soil; but I think that this question is easily answered in the negative. Guano contains nearly all the organic and inorganic ingredients requisite for the healthy development of a plant, in the relative quantities; it contains, therefore, in itself nearly all the nutriment required by a plant, so that as long as it lasts, very little nutriment is required from the soil. It may be improved by the addition of boiled bones, and must be improved by the addition of alkalies, if the soil is deficient therein, as the guano cannot supply the whole demand for alkalies made by the plant; in such cases an equal weight of carbonate of soda added to the guano will prove of the greatest advantage. The arrival of the African guano will, no doubt, bring it into more general use. I believe it is selling at from 6*l.* 10*s.* to 7*l* per ton at Liverpool, at which price it is cheaper than the Peruvian at 10*l*; that is to say, 10*l.* worth of African guano will produce more than one ton of Peruvian at 10*l.* The African guano contains from 20 to 25 per cent. of water, and from 12 to 15 per cent. of sand. It would be advantageous to mix it with some pounded chloride of lime, to fix the free ammonia. Sulphate of lime will not do for this purpose, as it requires too much water for solution. Guano thus prepared with chloride of lime should be kept in a dry place. The farmer will do well to buy his guano at a first-rate house, or direct from the ship, as he will otherwise not be certain of obtaining a genuine article; should he, however, be

compelled to buy it at second or third hand, he will do well to put it to the following tests:—1, Weigh a sample and lay it on a piece of post-paper on a warm hob (not hot enough, however, to char the paper) until it appears quite dry, withdraw it and weigh it; the loss sustained is water. 2, Take the sample thus dried, put it into a wine glass, and pour hot water over it; stir well for a minute or two, allow it to settle, and then pour off carefully the supernatant liquor, add hot water again, and proceed as before; then pour a small quantity of muriatic or nitric acid into the glass—the acid will dissolve all the undissolved salts, and nothing will remain of the guano but pure sand; wash this carefully dry, and weigh it. The African guano should not contain more than from 12 to 15 per cent. 3, Take a fresh sample of the guano, weigh it, and put it into an evaporating basin, and heat it over a spirit-lamp, as long as fumes are given off, and the guano appears black. Weigh it again, deduct the water from the volatilised portion, and the remainder of the loss will consist of ammoniacal salts. The greater the quantity volatilised, or the smaller the quantity remaining in the basin, the better is the guano. The admixture of sawdust will be detected by the second test, as it will float on the water in the glass. Guano is best applied as a top-dressing. To increase its bulk, mix it well with sawdust or dry soil. It should be laid on in wet weather. A good artificial guano would be superior to the natural, because we should be more certain of an equal product. The best guano would be carefully evaporated human urine, or a mixture of the salts in the relative proportions as they exist in Nature.—*A. Bernays, Manchester.*

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A Monthly Council was held at the Society's House in Hanover Square on Wednesday last the 1st of May; present the Right Hon. Earl Spencer, President, in the chair. Duke of Richmond, Earl of Rosebery, Viscount Hill, Lord Braybrooke, H. J. Adeane, Esq., Col. Austen, D. Barclay, Esq., M.P., T. R. Baker, Esq., J. R. Barker, Esq., J. S. Browne, Esq, F. Burke, Esq., Rev. T. Cator, Col. Challoner, F. C. Cherry, Esq., H. Colman, Esq., Sir A. B. Corbet, Bart., G. Cottam, Esq., E. D. Davenport, Esq., J. E. Denison, Esq., M.P., W. Fielden, Esq., M.P., A. E. Fuller, Esq., M.P., B. Gibbs, Esq., H. Handley, Esq., C. Hillyard, Esq., W. F. Hobbs, Esq., J. Hudson, Esq., W. H. Hyett, Esq., Sir J. V. B. Johnstone, Bart., M.P., J. Kinder, Esq., W. Miles, Esq., M.P., A. Ogilvie, Esq., W. W. Pendarves, Esq., M.P., H. Price, Esq., P. Pusey, Esq., M.P., F. Pym, Esq., J. Ransome, Esq., Professor Sewell, W. Shaw, Esq., J. Shelley, Esq., R. A. Slaney, Esq., J. S. Stanhope, Esq., Sir H. Verney, Bart., and H. Wilson, Esq. The Rev. Thomas Cator, of Skelbrook Park, near Doncaster, was elected a Governor, and the following gentlemen Members of the Society:—

Masterson, James, Collingbourn-Ducis, near Marlborough
Powell, Edward Lloyd, Abergavenny
Huddlestone Andrew Fleming, Hutton-John, Penrith, Cumberland
Colburne, William, Stratford upon-Avon
Buckley, Colonel Edward P., Minstead Lodge, Lyndhurst, Hants
Bedford, John, Woodcote, Shiffnal, Salop
Davies William, Nethertown Farm, Harewood, Ross, Herefordshire
Blundell, Joseph, Maidenstone Heath, Hound, Southampton
King, Richard, Stoneham, Southampton
Malcolm, Robert, Earwaker, Sutton Farm, Alresford, Hants
Richards, William Haggett, Lea-Coombe, Axminster, Devon
Foster, Augustus, Warmwell-house, Dorchester, Dorset
Corbett, James, The Sheriff's Farm, Kington, Herefordshire
Grubbe, I. A. Hunt, Windlesham, Bagshot, Surrey
Mechi, John Joseph, 4, Leadenhall street, London
Coles, Henry Beaumont, Middleton-house, Whitchurch, Hants
Thatcher, William, Wackland, Newchurch, Isle of Wight
Harris, James, Alton Farm, Amesbury, Wilts
Phillips, Henry, Coventry
Portal Melville, Freefold Priors, Overton, Hants

The names of 16 candidates for election at the next meeting were then read.

Finances.—Mr. Raymond Barker, Chairman of the Finance Committee, presented to the Council the Monthly Report of the state of the funds of the Society, from which it appeared, that on the preceding day the current cash-balance in the hands of the bankers amounted to 1422*l.*, independently of the sum of 1000*l.* remitted from Southampton as a subscription, to meet the heavy estimated expenses to be incurred by the Society at its ensuing annual country meeting at that place in July; and that the stock invested in the public funds amounted to 7700*l.* The Chairman further reported a communication received from Mr. Colvile, M.P., announcing the final and satisfactory adjustment by the Local Committee of the only outstanding claim on account of the Derby meeting.

Prize Essays.—Mr. Pusey, on the part of the Journal Committee, reported the following recommendations in reference to Essays sent in hereafter to compete for the Society's prizes:—1st. That in future, competitors should be required to inclose their names in a cover, on which only their motto and the subject of their papers, and the number of that subject in the Society Prize List, should be written.—2d. That the chairman of the Journal Committee alone should be empowered to open the motto-paper of such essays not obtaining the prize, as he may think likely to be useful for the Society's objects; with a view of consulting the writer confidentially as to his willingness to place such paper at the disposal of the Journal Committee.

These recommendations were unanimously adopted by the Council

Southampton Meeting.—The Council gave final directions for the completion of the contracts for the various works connected with the Show-yard and Pavilion at Southampton, with Mr. Manning, agreeably with the plans already adopted for those purposes: Mr. Parkes being requested to draw up, as usual, the Report of the implements exhibited and tried at that meeting, the Stewards granting him every facility in effecting that object.

Country Meeting of 1845.—Colonel Challoner, as chairman of the Committee appointed at the last Council for examining the various plans and other documents received from the authorities of Shrewsbury and Chester, and reporting the result of a personal inspection, by a deputation from their body, of the sites respectively offered at each of those places, for the purposes of the Society's country meetings of next year, informed the Council of the careful scrutiny the Committee had instituted into the whole of the details submitted to them; and concluded by laying before the Council the joint and very valuable Report of Colonel Austen, Mr. H. Gibbs, and Mr. B. Gibbs, who, as such deputation, had visited Shrewsbury on the 26th, and Chester on the 27th of April. This Report detailed the critical and minute examination which the deputation had successively made, of the various sites proposed at each place for the accommodation of the Society, and the purposes of the meeting; and having been unanimously adopted, the Council received the deputations then in waiting from the authorities of Shrewsbury and Chester.

Shrewsbury.—Lord Hill and the Hon. R. H. Clive, M.P., introduced the deputation from Shrewsbury, consisting of J. T. Smitheman Edwardes, Esq., the present mayor, and Edward Haycock, Esq., the late mayor of that borough.

Chester.—R. H. Barnston, Esq., Chairman of the Chester Local Committee, appeared on behalf of the authorities of that city.

The President addressed to each of these deputations a series of inquiries on the various points of information required by the Council, in order to enable them to arrive at a just decision on the question before them; and the deputations respectively having made such replies to these inquiries as they were instructed, withdrew; when the Council proceeded to a consideration of the claims of each place, and for the Country Meeting of 1845, and a discussion on the respective merits of the localities proposed for the purposes of the occasion. On the motion of Mr. Shelley, seconded by the Duke of Richmond, it was then unanimously resolved that the Annual Country Meeting of the Royal Agricultural Society of England, for the year 1845, should be held at the town of Shrewsbury, on the condition that the deputation on the part of the authorities of that borough would engage to enter into such stipulations with the Secretary, on the part of the Council, as would embody in writing the substance of what had then passed in conversation during their interview. The deputation from Shrewsbury on again entering the Council-room, and being informed by the President of the unanimous resolution of the Council, returned suitable thanks for the honour thus conferred on the locality they then represented, and cheerfully acquiesced in the condition annexed to the decision.

Annual Elections.—The Council then proceeded, agreeably with the Bye-laws, to nominate by ballot the list of members of Council recommended by them for election at the ensuing General Meeting, on the 22d of May, at ten o'clock (instead of twelve, as formerly) in the forenoon; and to give orders for due public notice of that meeting, by advertisement as usual; as well as to agree to the form of provisional Prize Sheet for 1845, to be submitted in proof to the members present on that occasion, for the favour of suggestions in reference to the nature, amount, and conditions of the prizes proposed,—to be taken into final consideration at the Council specially appointed for that purpose at the end of June.

Special Councils.—The President gave notice that, in order to meet the views of Mr. Shelley in his proposal of an adjournment of the Council over the period of the ensuing Annual Country Meeting, it was his intention to give orders for the summoning of such special Councils, to be held at certain stated dates and places during the period of the Country Meeting, as on due previous consideration might be found requisite.—Mr. Shelley expressed his entire satisfaction at this arrangement, and immediately withdrew the motion of which he had given notice at the last Monthly Council.

American Seeds and Implements.—Mr. Colman, the American Agricultural Commissioner, presented to the Council a most interesting collection of seeds and implements from the United States, with the following memoranda of their respective merits:—

1. *Plough*, made by D. Prouty and Co., Boston, Massachusetts. This plough is used in the United States as a small ox or 2-horse plough, and works well both in sward and old land; it will turn the furrow-slice completely over, and shut in level, or lay them at any desired angle, completely covering in all vegetable matter on the surface. The rod from which the draft is taken is capable of being elevated or depressed, to give the right pitch into the ground, so that it will keep its depth, and yet not bear too hard upon the wheel. It can also be moved at pleasure to the right, to cause the plough to take more furrow; or to the left, to cause it to take less. Upon the arrangement of this will depend much of its success in work. It is very desirable that it should be tried, and a good ploughman made familiar with its mode of working, before a final opinion is passed upon its character. This plough being made on what is called the centre-draught principle, has its standard and land-side inclined so far to the right as to admit of the beam being placed over the centre of resistance and parallel with the land-side, and will take its width of furrow, when drawn from the centre of the beam with such team as we use. To persons accustomed to plough with the land-side and standard perpendicular, this may appear singular, but to make good work it should run level as it stands on level ground.—2. *Plough*, made by Messrs. Ruggles, Nourse, and Mason, of Boston, Massachusetts. This plough is calculated for deep-ploughing, being both higher and longer than any other ploughs in the United States. It had been greatly approved at various trials, and had taken a large sweep of premiums at many of the public Shows.—3. *Grain-Cradles*, for cutting and laying all kinds of grain in a manner to be easily taken up by the binders, and with great expedition. One of the cradles then presented had been long known and approved in New England; the other was of a novel construction, and stated to be on a very improved plan, but Mr. Colman had not seen it before.—4. *Scythe-Snaiths*, made upon an improved and approved pattern; and snaiths made in this way are always alike, the wood being first softened and bent in steam, and then permanently fixed in the desired form, by being allowed to dry in a mould. The nabs or handles are capable of being screwed or unscrewed, so as to be fixed in a desired position without wedges; and a brass socket is sunk in the end of the snaith, so that the hook of the scythe may be held firm, and not become loose by wear, so as to require wedging.—5. *Weeding-knife* for Turnips or other small plants, of a peculiar construction.—6. *Scuffle-hoe*, on a new plan for garden use.—7. *Tree-scraper*.—8. *Hoes*: Two common narrow hoes, made with a socket for the handle, and with the blade neatly riveted.—9. *Manure-fork*, of cast-steel, made by Mr. H. Partridge; very light and elastic, and would be broken only with much ill-usage.

The collection of seeds which accompanied these implements consisted of Millet Seed, Herd's Grass or Timothy Seed, Brom Corn Seed (along with brooms made of the Grass), several varieties of Indian Corn (Maize), Sweet Corn, Tuscarora Corn, and Canada Corn. Mr. Colman stated that another plough was on its way to England, as a further present from himself to the Society.

In addition to these donations Mr. Colman laid on the table several private copies of the first Part of his European Agricultural Tour, for distribution among such of the Members as would accept them; from whom, and all other readers, Mr. Colman expressed an earnest wish to receive both candid criticism and such direction in the acquisition of useful information as would enable him to render the succeeding parts of his Work more calculated to fulfil the object he had in view in its publication, namely, to advance the common cause of Agricultural improvement in both countries, and by an interchange of communication to promote that perfect understanding on every subject which it was so highly important in a national point of view should constantly subsist between two countries so truly kindred.

On the motion of the Duke of Richmond, the cordial thanks of the Council were voted by acclamation to Mr. Colman, for his very important and interesting collection of presents, the value of which in the estimation of the Council was enhanced by the manner in which he had thus testified his respect towards the Society. Mr. Colman, in acknowledging the thanks of the Council, would not have it inferred by the remotest implication that in thus laying before them specimens of the ingenuity of American art in the construction of implements of husbandry, that they were intended as evidences of any triumph over the distinguished implement makers of the old country, but simply as instances of that interchange which he was so desirous to effect and to which he had alluded, of improvements which might prove useful to both countries. He felt deeply grateful for the personal kindness he had everywhere received in his progress through this country. He had now been connected more than 40 years with the pursuits of Agriculture, and he found his satisfaction in its unbounded resources only increase with years, inasmuch as with the extension of the benefits of Agriculture there was also a diffusion of the blessings of moral improvement.

Mr. Shelley and Mr. Miles, as the Stewards of Implements, informed the Council that they had already made arrangements for the trial of the American Ploughs at the Southampton Meeting: a complete and ample trial would be given them in the same fields in which the other ploughs were tried; and they should rejoice at any result in their favour which might lead to further improvement in our own Agricultural implements. The President then conveyed to Mr. Colman an expression of his thanks for the services he had rendered to the Society in his official capacity as the Agricultural Commissioner of the United States, and in that of an Honorary Member of the Society in favouring the Council so often with his personal attendance at their Meetings.

Model Experiment.—Mr. Miles communicated to the Council the following arrangement for the Model Experiment, which Mr. Barclay, Mr. Hilyard, and the Rev. Thomas Cator had consented to try, and in which he hoped other members of the Society would be induced to join.

Seed: Skirving's Swedish Turnip (to be procured of Messrs. Thomas Gibbs, and Co., Seedsmen to the Society, corner of Half-Moon Street, Piccadilly), to be sown after a White Straw Corn crop.

Manures: Common dung, 20 tons per acre.

Peruvian Guano, 3 cwt. mixed with	9 cwt. of Ashes.		
African Guano,	do.	do.	do.
Potter's Artificial Guano,	do.	do.	do.

Distances between the rows, 18 inches and 27 inches.—If it be desired to allot half-an-acre to each kind of manure, and the half-acre be divided into two lots for the two breadths of rows, there will be eight trial lots, each of one quarter of an acre. Where the rows are at 18

inches distance, if they are 110 yards in length, there will be 22 such rows in each single lot; to which one-quarter of the above quantities of manure will be severally applied. Where the rows are 27 inches distance, 14⅓ rows will be the extent of each lot, which will receive the same quantities of manure. Numerous presents were received, and thanks ordered for them.—The Council then adjourned to Wednesday next, the 8th of May.

Miscellaneous.

Selection of Forest Trees.—It should always be borne in mind, that trees, unlike crops, are to remain for an unlimited time, so that, when once planted, they are expected to thrive for perhaps upwards of a century, and on this account, proprietors are willing to lay out a considerable amount of capital upon plantations, in the hopes of abundant returns after the lapse of many years. How important, therefore, must it be in all cases to take every precaution against failure, which, in this instance, must be attended with great pecuniary loss. It is well known that very few, if any, forest-trees confine their roots to the soil, by far the greater quantity extending more or less deeply into the subsoil; and what is exceedingly interesting and important, it has been proved, that trees growing in an unkindly soil either die out, or, if the soil contains a minute supply of all that they require, they send nearly their whole strength to the roots, which travel to great distances in all directions, in search of a sufficiency of those ingredients of which they can obtain only a very minute supply at each particular spot; since, however, it is the stem and not the root which is in most cases turned to a profitable account, the strength of the sap being expended upon the root must, at all times, be attended with loss. Very little has hitherto been done regarding the chemical analysis of forest-trees, but what has been accomplished goes to prove that the ashes of different trees differ so much from each other, that soils capable of bringing one kind to the greatest perfection may entirely fail to support others. This being the case, it is surely a want of foresight in a proprietor to plant, perhaps, hundreds of acres of certain trees, before he has determined by a chemical analysis of the soil and subsoil, whether they are calculated to produce a thriving plantation, or whether some other tree might not be better suited to the soil and climate."—*Dr. Madden on the Advantages of Extended Chemical Analysis to Agriculture.*

Real Value of Crops.—"A circumstance most particularly to be attended to in the estimation of crops, and one far too apt to be neglected, is, that bulk and weight are not necessarily true indices of the real value, as they do not always represent correctly the amount of nourishment contained, and we need scarcely remark that the latter is the true object for which every crop is cultivated. * * * In some experiments related in Professor Johnston's "Elements of Agricultural Chemistry," the results are stated in two tables; 1st, The number of bushels of Wheat, Oats, and Barley, obtained for each bushel of seed sown; and, 2d, The amount of starch and gluten contained in 100 parts of each of the samples. The real value of the crop is, therefore, closely approximated by comparing the two tables together. * * * In the experiments alluded to, cow-dung produced 16 bushels of Oats for each bushel sown; whereas night-soil (generally esteemed much the strongest manure) produced only 14½ bushels. Arguing from this alone, therefore, one would be apt to suppose night-soil inferior to cow-dung for Oats, and in fact, without the aid of chemical analysis, such would have been the legitimate conclusion. When, however, the Oats were analysed, it was found that that grown with cow-dung contained 3½ per cent. of gluten only, whereas the night-soiled specimen contained 5 per cent. Comparing these together, therefore, we arrive at the important conclusion, that whereas, by measure, the night-soil was to the cow-dung as 14½ to 16; when the real nourishment was ascertained, the proportions were 72½ to 56, or as 12 to 9 nearly, showing a real increase of ¼, where, by the ordinary method, a deficiency of about ⅛ was apparently proved.—*Dr. Madden, on the Advantages of Extended Chemical Analysis to Agriculture.*

Ballinasloe Union Farming Societies.—The following is the return from the model farm which it will be recollected is, with the exception of a couple of acres, and which two acres were recently a rushy marsh, deep bog:—

1842. Kind of crop raised.	Quantity of Land under these crops.			Realised return from the land.			1843. Kind of crops sown.	Quantity of Land under these crops.			Realised return from the land.		
	A.	R.	P.	£	s.	d.		A.	R.	P.	£	s.	d.
Turnips	2	2	0	28	12	0	Turnips	2	0	0	36	0	9

Turf	0	0	0	20	0	0	Turf	0	0	0	15	4	1
							Under Rape	1	1	9	5	0	0
Totals	8	3	0	123	14	7½		10	2	0	143	8	10

Expenditure for labour in 1842 . . . . . £65 6 0
Expenditure, up to Sept. 20, for labour in 1842 . . 31 1 9

We saw the root crops on the model farm, and on reference to our notes, find that we estimated the crops fully up to the amount for which credit is taken in the above account; but it would have been satisfactory, as affording useful information, to be informed with respect to the data upon which the value of the crops has been based.—*Dublin Farmers' Gazette.*

Loss of Time in Ploughing.—When ridges are 78 yards in length, no less a space of time than 4 hours and 39 minutes is spent in turnings in a journey of 8 hours; whereas when ridges are 274 yards long, 1 hour and 19 minutes is sufficient in the same length of time.—*Code of Agriculture.*

Notices to Correspondents.

Rural Chemistry. By Edward Solly, Esq., F.R.S., Experimental Chemist to the Horticultural Society of London, Hon. Mem. of the Royal Agricultural Society, and Lecturer on Chemistry at the Royal Institution, has been reprinted from the *Gardeners' Chronicle*, with additions, and may be had of all booksellers, price 4s. 6d.

Guano.—*W. H. Harwood.*—We shall be glad to receive your proofs of the value of this manure; we cannot, however, promise always to publish them.

Potato.—*Constant Reader.*—Next week.

Potato-rot.—*J. McI.*—We think that over-ripening is more likely to be the cause of the disease than under-ripening; but please to send your paper. There is nothing like a well-conducted discussion for eliciting truth. There is a letter for you at our office; if you will forward your address, it shall be posted.

Potter's Guano.—*Amateur Gardener.*—Mix it well with the soil before sowing the seed.

Profits of Farming.—*X. Y.*—They depend on the amount of capital employed. We may safely say with Mr. Cooke, in his work on the "Value of Land," that no one should invest his capital in farming unless he expected a profit equal to, at least, ten per cent. on its amount.—Guano will suit Carrots, Parsnips, and Cabbages perfectly. Mix it well with the soil. Carrots and Parsnips ought to have been sown nearly a month ago.——*A. B.* says, "A Farmer and Valuer" would confer a great obligation upon our readers, if he would state, in addition to his valuable article on "The Farmers' Capital," at page 265, what the average annual outgoings might be fairly set at; these to include, besides rent, rates, labour, seed, &c., a fair sum for wear and tear, and interest on capital. Also what the average annual Grass produce might be set at.

Prickly Comfrey.—*Subscriber.*—The prickly Comfrey is propagated by dividing the roots and planting them in good rich soil, in rows 2 feet apart, and about 18 inches from plant to plant. We never can procure seed of it. It was first brought into notice at Lewisham sometime ago, and was reported as very superior fodder for cattle. When *quite young*, cattle will eat it, but not if they can get anything better, such as Tares, &c.; but after a while it gets tough and prickly, and nothing will touch it. If you wish any, you can have plants at the nurseries for 11s. or 12s. per 100. The crop is very abundant. —*S.*

Soil.—*A. J.*—Your specimen appears to be a very poor ferruginous sand, the application of which would benefit no soil but stiff calcareous clays.

Turnips.—*M. A.*—The Aberdeenshire yellow bullock Turnip is one of the best kinds. Skirving's, Drummond's, Watson's, and Laing's Swedes are all good varieties; the last is perhaps the best. Your crop will not be so good under the trees.

*** As usual, many communications have been received too late.

Markets.

MARK-LANE, Monday, April 29.

We had a liberal supply of Wheat this morning from Essex and Kent; that from Suffolk was small; the Essex was nearly all disposed of at the prices of last week, but a great part of the Kent remained unsold at the close of the Market. The transactions in Foreign Wheat were limited, but there appeared to be a few country buyers at lower prices, which factors generally were not disposed to comply with.—English Barley must be written rather cheaper; the demand for Foreign has increased, and a considerable clearance has been made, at fully the rates of last week.—Beans are 1s. per qr. dearer.—Peas are unaltered in value. —The supply of Oats being small, and the demand good, late rates are rather exceeded.

Friday, May 3.

There are no fresh samples of English Wheat offering this morning, and the Kentish left over from Monday have met a dull sale at barely that day's quotations. The demand for free Foreign has somewhat increased, but without leading to more extensive business; prices, however, are firmly maintained.—Notwithstanding the large arrivals of Foreign Barley, there is not a great deal offering on the Market, the larger proportion having gone direct to the Distillers'; its late value is supported, but the sale is rather slow. English remains without alteration, and the same may be said of Beans and Peas.—The Oat trade is firm at Monday's prices.

Kingsford and Lay.

POTATOES.—Southwark Waterside, April 29.

We believe the extraordinary fine weather that we have had for some weeks past has been unprecedented at this season of the year; and it bears heavily on the holders of Potatoes, lessens consumption, and rapidly forces vegetation. The supplies during the past week have been greater than the demand, and there are a number of former arrivals unsold. There continues to be some cargoes from Belgium, Holland, and Ireland, selling from 40s to 45s per ton. The demand for the best samples is limited, and there are several inferior samples that have been put into the stores. Although the holders were anxious to force sales at low prices, further reductions have been submitted to, and many of our present quotations are merely nominal.

SMITHFIELD, Monday, April 29.—Per stone of 8 lbs.

Best Scots, Herefords, &c.	3s 8	to 4s 0		Best Downs & Half-breds	4s 0	to 4s 4		
Best Short Horns . .	3 4	3 8		do. shorn . .	3 6	3 10		
Second quality Beasts .	2 10	3 4		Best Long-wools . .	3 10	4 0		
Calves	4 0	4 8		do. shorn . .	3 4	3 8		
Lambs, small . .	6 2	6 6		Ewes and second quality	3 4	3 8		
— large . .	5 4	6 0		do. shorn . .	3 0	3 4		
Pigs	3 0	3 8						

Beasts, 2613; Sheep and Lambs, 30,090; Calves, 103; Pigs, 270.

We have again a short supply of Beasts, which has caused the trade to recover the depression that was experienced on Friday last, and our prices today are about the same as last Monday; in some instances the very best qualities have rather exceeded our highest quotations, but those instances are very rare. Second-class Beasts have rallied a little. We have a large market of Mutton, which causes a worse trade; the demand, however, is still very considerable, and almost everything is sold. Big Sheep have suffered a reduction of nearly 2d per 8 lbs; the trade is also heavy for shorn Half-breds, which are rather numerous, and can hardly be quoted at more than 3s 8d per 8 lbs. Selling polled Sheep are getting now more in season, and have experienced less reduction than any other description. Lamb is getting more plentiful, and prices are a little lower. Veal also suffers a small reduction, owing to increase in numbers. Pork is lower.

Friday, May 3.

The supply of Beef is moderate, and our quotations of Monday are well supported, but we cannot discover any advance. There is a fair quantity of Sheep in market, and a pretty good demand for sizeable qualities of shorn Downs, &c., at about 4s, and of shorn polled Sheep at about 3s 8d per 8 lbs. Trade is very heavy for large fat Sheep, and cannot be said to make more than 3s 4d out of the wool. The best Lambs maintain their price, about 6s 6d, but there are plenty of middling quality in market to day which are sold with difficulty at about 6s. We have a large supply of Calves, but the best are still making about 4s 8d per 8 lbs. Pork remains steady.

Beasts, 560; Sheep and Lambs, 9220; Calves, 223; Pigs, 360.

41, West Smithfield.

COVENT GARDEN, May 4.—There is a considerable improvement this week in hothouse Grapes; they are both more abundant and finer in quality. A few Portugals are in the market, but they are becoming scarce, and there is not much demand for them. Pine-apples are nearly the same as last week. Apples of good quality are scarce, and there are only a very few Pears in the market. Green Apricots and small Gooseberries continue to be supplied; the latter are offered at from 10d. to 1s. 3d. per pottle. Oranges are somewhat advanced in price since our last report, as are also Strawberries; the latter are selling at from 6d. to 1s. 6d. per ounce. Vegetables, in general, have not altered much since our last report. Although the continued dry weather begins to be felt, yet most articles are good in quality, and sufficient for the demand. Considerable quantities of young Cabbages have been supplied during the week; a few Cauliflowers are also in the market. New Carrots bring from 9d. to 1s. 6d. per bunch. Young Turnips are a little reduced in price. Broccoli is becoming scarce. Greens are nearly the same as last week, and there is little alteration in Rhubarb, Seakale, French Beans, or Asparagus. Lettuces and Salading of all kinds are sufficient for the demand. Cut Flowers consist chiefly of Erica hybrida, E. aristata, Ceanothus azureus, Stephanotis floribundus, Pelargoniums, Lily of the Valley, Cinerarias, Auriculas, Calceolarias, Tulips, Azaleas, Fuchsias, China-Provence, and Moss Roses.

Basil, 6d to 9d per bunch.	Savory, 6d per bunch

HOPS, Friday, May 2.

The late cold nights and easterly winds have checked the growth of bine, and is thought will greatly encourage vermin; the flea is already very numerous, and doing considerable injury, in many of the plantations. Several planters have, in consequence, withdrawn their Hops from sale, and buyers begin to feel some anxiety, as, should we get an attack of fly this month, with the small stock on hand, prices must advance considerably on our present quotations.

PRINCIPAL MANURES.

	Weight per bush., about lbs
Alum, 240s per ton . . .	—
Bleaching Powder, 28s per cwt. .	—
Brimstone, 200s per ton . .	—
Bone-dust, —s and 17s per quarter	45
— Half-inch, 16s ditto .	42
— Calcined, 8s per cwt .	—
Carbonate of Ammonia, 70s per cwt	84
— of Lime, 1s to 1s 6d per cwt	—
— of Soda, 36s to —s per cwt	—
Chloride of Lime, 30s per cwt .	—
Graves, —s to —s per ton . .	—
Guano, Bolivian, —s to 220s p. ton	—
— African, —s to 205s p. ton	—
— Potter's, 240s per ton .	65
— Potter's Liquid, 18s p. doz.	—
Gypsum (Sulph of Lime), 35s p. ton	—
Hallett's Dry Fertiliser, 500s p. ton, or 12s per cwt. .	—
— Concentr. Liquid, 1s 6d per qt. bottle, or 7s 6d large bot.	—
Humphreys's Compound for Plants in Pots, 16s per doz. . .	—
— Farmers' Compound, 12s per cwt. . . .	—
Muriate of Ammonia, 24s per cwt.	70
— Lime, 5s to 6s .	70
Nitrate of Soda, 15s 6d to 16s per cwt., duty paid . . .	80
Phosphate of Lime, 6s 6d p. cwt. .	65
— — Super, 7s to 8s p. cwt.	65

	Weight per bush., about lbs
Phosphate of Ammonia, in fine powder, 28s per cwt. .	65
— of Ammonia, in crystals 2s 3d per lb . .	—
Rape Cake, 105s to —s per ton .	—
— Dust, 110s per ton . .	—
Sal Ammoniac, 56s per cwt.	80
Salt, Agricultural, 32s per ton .	80
— clean, 36s per ton .	84
— Hide, 21s per ton . .	—
Saltpetre (Nitrate of Potash) 26s 6d per cwt., duty paid	80 to 84
Silicate of Potash, in powd., 65s p. cwt.	—
Soap Ashes, —s per ton . .	65
Soda Ash, 14s to 16s per cwt. .	—
Sulphate of Ammonia, 360s to 400s per ton . . .	70
— of Copper, 38s to 40s p. cwt.	—
— of Magnesia (impure) 10s per cwt. . . .	65
— of Magnesia (pure cryst.) 12s p. cwt. .	65
— of Potash, 18s per cwt.	—
— of Soda, 5s to 6s per cwt.	—
Sulphur, 15s per cwt. . .	—
Sulphuric acid, London, 2d per lb.	—
— Country made, 1½d per lb.	—
Whitney's Composition for Frames and Lights, 24s and 40s per doz.	—

Expenses of shipping about 5s to 7s per ton, according to quantity.

Mark Fothergill.

RENDLE'S TANK SYSTEM OF HEATING.

STEPHENSON AND CO., 61, Gracechurch-street, London, Inventors of the IMPROVED CONICAL and DOUBLE CYLINDRICAL BOILERS, having been much engaged in heating buildings upon the above system with Tanks of various materials, solicit the attention of scientific Horticulturists to an Iron Tank now fitting up on their premises, which offers most decided advantages over every other article hitherto employed for the same purpose. These tanks, which are ornamental in appearance, can be made from 10 to 100 feet long and of any width and depth, and can be connected or disconnected by any working Gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of employing this much approved method of heating without the assistance of Engineers. The Tanks can be applied to Boilers and Pipes already fixed, and from the present low price of Iron will be found cheaper than of any other material. MR. RENDLE, of Plymouth, has kindly undertaken to receive orders and furnish information to any persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

IRON WORKS.

COTTAM AND HALLEN, WINSLEY-STREET, OXFORD-STREET, LONDON.

GARDEN ROLLERS, RICK-STAND, or STACK STATHEL, at very low prices.

GARDEN SYRINGES, 9*s.* 6*d.* each.

HAND-GLASS FRAMES for Cucumbers, &c., 18 inches square, 20 inches, and 22 inches.

CAST-IRON FLOWER-STAKES, 4 ft. long out of the ground, 4 ft. 6 in., 5 ft., 6 ft., and 7 ft.

Watering-pots, Garden Engines, Mowing Machines, Garden Chairs, Superior Garden Tools of all kinds, Garden Vases, in great variety, and every description of article used in Horticulture.

BEST WIRE, for STRAINED WIRE-FENCING, at 8*s.* 6*d.* per bundle of 150 to 160 yards each.

Flower-bordering, Trainers, Garden Arches, Flower-stands, Rose-tree Guards, and every description of Ornamental Wire-work, for Gardens, &c.

HOTHOUSES, CONSERVATORIES, &c., made upon the most improved principle, either of iron or of iron and wood combined, which can be fixed complete in any part of the Kingdom, at very low prices.

HOT-WATER APPARATUS for heating Hothouses, Conservatories, and Greenhouses; Churches, Public or Private Buildings, &c., with COTTAM'S PATENT, or ROGERS'S BOILERS. After 15 years' experience, and having fixed upwards of 1500 Apparatus for the above-mentioned purposes, and by various improvements which they have made during that time.

RENDLE'S TANK SYSTEM on an improved simple plan.

Show Rooms at their Manufactory. No. 2, Winsley-street, where estimates and every information may be obtained.

COTTAM AND HALLEN, AGRICULTURAL IMPLEMENT Makers, &c., 2, Winsley-street, Oxford-street, London.

DOUBLE-MOTION HAYMAKERS of the best construction, made almost wholly of iron, and containing the double Cylinder, and all the latest improvements, are now ready.

CAST-IRON HAY-RICK.—Pigtroughs at very low prices.

IRON HURDLES AND FIELD-GATES, of all sizes, at exceedingly low prices.

PLOUGHS, DRILLS, Sheep and Cattle Weighing Machines, Improved Prize Harrows, Field Rollers, Turnip-cutters, Chaff cutting Machines, Threshing and Winnowing Machines, Oil-cake Breakers, and every description of implements used in Agriculture.

Show Rooms at their Manufactory, 2, Winsley-street, Oxford-street, where every information may be obtained.

THE CONICAL HOT-WATER BOILERS, invented by J. ROGERS, Esq., may be obtained of any size from JOHN SHEWEN, Ironmonger, &c., Sevenoaks, Kent.

J. SHEWEN having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical; it may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pine-apple-place; Messrs. Veitch & Son's, Exeter; Mr. Pontey's, Plymouth; the Royal Botanical Society's Gardens, Regent's Park; and at the Gardens of the Horticultural Society of London. Considerable improvements have been effected since last season, particulars of which are in course of preparation.

BURBIDGE AND HEALY beg respectfully to inform the Horticultural world that they are quite ready to supply their new BOILER, of every size. They have now fixed a sufficient number to warrant them in stating that what they put forth as the qualities of their Boiler and Furnace arrangement may be perfectly relied upon: they have put up one at the Horticultural Gardens, where B. and H. believe it is considered to answer as represented; they have also fixed it in connection with a new description of Iron Tank, which combines the qualities of the round pipe and the open tank, which may be pronounced the perfection of a Heating Apparatus for Horticultural purposes, particularly for Graperies, Epiphyte-houses, Melon-pits, &c., &c. The arrangement is such that any gentleman or gardener may have the whole constructed so as to be put together with the greatest facility by the gardener, first sending a correct plan to 130, Fleet-street. A Prospectus may be had, detailing the prices, &c.

WIRE-WORK, HOT-WATER APPARATUS, GREENHOUSES, &c.

ST. THOMAS BAKER, MANOR-HOUSE, MANOR-PLACE, KING'S-ROAD, CHELSEA, Manufacturer of INVISIBLE WIRE FENCE, to resist Grazing Stock, and rendered Rabbit-proof. WIRE-WORK in Trainers, Arches for Walks, Bordering, Flower-stands, Pheasantries, &c. HORTICULTURAL BUILDINGS, Green and Hothouses, Conservatories, &c. The same heated by HOT-WATER APPARATUS, on improved and economical principles.

Parties waited on in Town or Country, and Drawings and Estimates free. Work for the Trade as usual.

Ward's Cases, or Domestic Greenhouses.

GUANO (GENUINE PERUVIAN & BOLIVIAN) ON SALE, BY THE ONLY LEGAL IMPORTERS, ANTONY GIBBS AND SONS, LONDON; WM. J. MYERS AND CO., LIVERPOOL;

And by their Agents,

COTESWORTH, POWELL, AND PRYOR, LONDON; GIBBS, BRIGHT, & CO., LIVERPOOL and BRISTOL.

47, Lime-street, April 25, 1844.

PERUVIAN GUANO, of first quality, and in any quantity, direct from the Bonded Stores. Also African Guano and Nitrate of Soda.—Apply to H. ROUNTHWAITE and Co., 6, Cable-street, St. George's Crescent, Liverpool.

TO GARDENERS AND AGRICULTURISTS.

SUPER-PHOSPHATE of LIME is capable of producing a more rapid vegetation in Plants than any substance known. It may be had at Mr. LAWES' Factory, Deptford Creek, price 7*s.* per cwt. Phosphate of Potash, 15*s.* per cwt.

" Soda 12*s.* "

" Magnesia 9*s.* "

" Ammonia 1*s.* per lb.

*** Super-phosphate of Lime in a concentrated form may also be procured of Messrs. WARNER, 28, Cornhill, and other Seedsmen, in 7 lb. packets, price 1*s.*

MANURES.

BOAST AND Co.'s PATENT INORGANIC MANURES.—These strong and productive manures have already proved their superiority over all others yet adopted. It is now thoroughly understood and acknowledged by intelligent agriculturists that each plant requires a distinct manure, and it is upon this perfectly scientific principle that these manures are prepared, being formed so as to supply all the substances taken from the soil by each particular crop. They are immeasurably more efficacious, far more economical than all others, and possess the great advantage of being easily applied to the land.

Prospectuses, with full particulars, may be obtained; or will be forwarded by post on application at the Manufactory, Bow, Middlesex.

*** By the use of these Manures, any land may be rendered fertile. Wheat, &c. may be grown on the same land every year with immense advantage to the farmer, and without injury to the soil; whilst all the other crops are greatly increased.

GUANO, superior to the foreign, at a reduced price.

Manures prepared expressly for Gardeners and Florists.

THE URATE of the LONDON MANURE COMPANY, 5*l.* per Ton. It is with the greatest satisfaction, after three years' experience, the Company are enabled to recommend the above as one of the best manures for Barley, Oats, Spring Wheat, and more especially Turnips. By promoting a rapid growth of the latter it secures a full plant, at the same time producing a great weight per acre, and extending its beneficial effects to the succeeding crops. The Urate may be sown broadcast, or which is preferable, by the drill, at the rate of one ton to three acres, and it is desirable it should not be placed more than two inches below the surface. As a top-dressing for Wheat the Urate has been used with great advantage. Gardeners and Florists will find it very useful for Dahlias and other roots. Full particulars and Testimonials will be forwarded on application. Genuine Peruvian Guano; Phosphate and Sulphate of Ammonia; Gypsum and every other artificial Manure.

EDWARD PURSER, Secretary, 40, New Bridge Street.

MOST IMPORTANT TO FARMERS AND GRAZIERS.

GIBBONS' DISINFECTING OINTMENT, a most effectual and perfect cure for Epidemic and Foot-rot in Sheep; also for Epidemic and Foul in Cows' Feet, and for the Grease and Thrush in Horses; prepared only by HENRY GIBBONS, Agricultural Chemist, Wolverhampton.

This Ointment effectually destroys the American grub on Fruit-trees. Sold by all respectable Druggists in Town and Country, in packets at 2*s.* 6*d.* each. Mr. William Bailey, Manufacturing Chemist, North Street, Wolverhampton, is appointed Sole Wholesale and Shipping Agent.

DR. HALLETT'S LIQUID FERTILISER.—The beauty of Flowers, with their power of perfecting their Seeds, and the flavour and size of Fruits and Vegetables, must ever depend upon the food supplied to the plants producing them, and these a very extensive series of trials on various soils has shown, may be secured by the use of Dr. HALLETT'S CONCENTRATED LIQUID FERTILISER, which contains all the essential ingredients of the best foreign Guano, with others equally so, but not to be found by Sea Fowl, in the Atlantic Ocean. Sold at Mr. G. HALLETT'S Factory, Broad Wall, Blackfriars; Messrs. WINSTANLEY'S, Chemists, 7, Poultry; Messrs. WARNERS, 28, Cornhill; Messrs. HURST and M'MULLEN'S, 6, Leadenhall-street; and every respectable Chemist's and Seedsman's, with directions, in stone quarts, at 1*s.* 6*d.* each, and in bottles, six times the size, at 7*s.* 6*d.* The quart requires 32 gallons of water to reduce it for use, for watering soils and growing bulbs in.

GLASS SUPERSEDED FOR HORTICULTURAL PURPOSES BY

WHITNEY'S CHEMICAL, TRANSPARENT, WATERPROOF COMPOSITION, for rendering Muslin, Calico, or Linen, for the Frames of Greenhouses, Pine, Melon, or Cucumber Stoves, &c., impervious to Rain or Moisture, admitting light equal to Glass, the *burning* rays of the *sun alone* being obstructed. Houses or pits covered with Calico, &c., prepared with this Composition, embrace important advantages over Glass. The light being equally diffused in every part of the house, plants placed on the floor have as much light as those close to the covering, consequently they are not drawn up as under Glass, while they continue much longer in *bloom*, and preserve their *delicate tints unfaded* till the *blossom falls*.

Whitney's Substitute for Glass.—I have had screens of calico rendered transparent with Mr. Whitney's invaluable varnish, and used them last winter, with a success far exceeding my most sanguine expectations, though my anticipations had been considerably excited. Indeed I consider Mr. Whitney's discovery as an invaluable boon to the horticulturist, one that will bear competition with any invention connected with the art and mystery of Horticulture in modern times. My screens were about 9 feet long each, and were inclined to the wall separated about 12 inches below, and as my object was to ascertain the value of the screens, in reference to *radiation*, they were *left open at each end*. Suffice it to say, the Fuchsia, Pomegranate, Passion-flower, Japan Honeysuckle, and others still more delicate and susceptible, were effectually preserved, and that without the slightest check to their growth, or any injury whatever. I am of opinion that in this *new aspect*, it possesses a protecting influence *infinitely superior to glass*, because the effects of radiation, a most powerful source of cold, are *not intercepted by glass*, which so materially counteracts the artificial temperature within; I cannot, therefore, but conclude, that for the protection, not merely of the early blossom, but the maturation of the fruit, as in the case of the Peach, Nectarine, Apricot, and Grape, these transparent screens, thus prepared, are invaluable, and their triumphant success certain. Add to this, for cucumber and melon frames, their superiority over glass is undoubted for preventing flagging of the foliage (sometimes being scorched) by day, and the chilling effects of radiation by night. Screens prepared with Whitney's Transparent Varnish should be also used as shades in the intensity of a summer's sun, and for protection against radiation in winter, for the stove, greenhouse and conservatory. Even in the *economy of fuel* the value of such screens is demonstrable, as less will be required to maintain an equable warmth, its escape by radiation being thus effectually checked.—J. M., 16*th April*, 1844.

Prepared by GEORGE WHITNEY, Chemist, Shrewsbury; and sold in Bottles, 2*s.* 6*d.* and 4*s.* 6*d.*, with ample directions for use; and, as a protection to the public, the signature of the inventor is on each bottle. Sold by the principal Seedsmen in London and throughout the kingdom. Merchants, Seedsmen, and Florists supplied by Mr. Bailey, North-street, Wolverhampton.

DR. HALLETT'S DRY SOLUBLE FERTILISERS are composed of all the useful ingredients of the best Foreign Guano, which manure must before long be exhausted, and under the name of which so much positive rubbish is already in the market, and no two parcels alike. They are Improvers of all Soils, but most so of Poor Ones: and cannot possibly prove injurious to Soil or Crop, as they contain no heating or caustic materials; being simply and purely Fertilisers. 5 cwt. of either of them is equal to nearly 30 tons of Horse Manure as a Fertiliser; and they enable crops, by increasing their vigour, to appropriate, with greater effect, those constituents of the atmosphere which are known to nourish all Vegetable life. No. 1 is adapted for the greatest possible Yield of all the varieties of Corn, Peas, Beans, Chicory, &c.; and No. 2 for Turnips, Mangold Wurzel, Natural and Artificial Grasses, and all Gardening purposes. This is the best Protector yet discovered against the Fly in Turnips; for, if sown with the seed, this Fertiliser gives a First Growth three weeks beyond that of any other known manure. Price of each, 10*l.* per ton.

Samples shown and Orders received by Mr. FOTHERGILL, 40, Upper Thames-street; Mr. G. HALLETT, at the Factory, Broadwall, Blackfriars, and Messrs. WINSTANLEY, Chemists, 7, Poultry, London.

The Fertilisers are manufactured under the immediate inspection of J. J. HALLETT, M.D., &c.

Agents:—Suffolk: Mr. W. REVANS, Yoxford; Norfolk: Messrs. BULLARD & WATTS, Norwich; Jersey: Mr. C. KRUGER, St. Heliers. Respectable Country Agents wanted.

SHANK'S IMPROVED GRASS-CUTTING and ROLLING-MACHINE.—The complete success which has attended the introduction of this instrument in Scotland is sufficiently attested by the accompanying documents, which the Advertiser has kindly been permitted to make public. The patent which has hitherto prevented its use in England expires on the 5th of August next; and Mr. Shanks is now prepared to receive orders for delivery in any part of the Kingdom after that period. As he can only supply a limited number of Machines this season, these will be forwarded in the order of the demands which he shall receive. They are made to cut breadths of 42, 30, and 20 inches respectively, the latter being adapted to hand-power.

Further particulars, and a note of prices, may be obtained by addressing Mr. ALEX. SHANKS, Machine-maker, Arbroath, North Britain.

Letter from the Right Hon. Lord Kinnaird to Mr. Shanks.

[Copy.] "Rossie Priory, Inchture, June 12, 1843.

"SIR,—I shall have much pleasure at all times in recommending your Mowing Machine, as answering most perfectly in every respect, as I have had some months' trial of it, and find that a man and horse and one woman can cut and clean up upwards of two acres and a half in seven hours, while it formerly took four men and three women nearly three days to put the same ground in order. "Your obedient servant, &c.,

"Mr. Shanks. KINNAIRD."

Letter from Mr. Taylor, Factor to the Earl of Camperdown.

[Copy.] "Camperdown, 20th April, 1844.

"SIR,—After using your Grass-cutting and Rolling Machine for the last season, I am glad to state, it has given us every satisfaction, and the Earl of Camperdown is much taken with it. I think we can cut nearly two acres in three hours with a pony, a man, and a boy. It answers well for green roads and walks; we can cut, in a morning, two to three miles in two rounds. If you wish it, the Earl of Camperdown will give you a certificate.

"I am yours, &c., THOS. TAYLOR."

Letter from Mr. Lindsay Carnegie.

[Copy.] "Kinblethmont, Arbroath, July 31, 1843.

"SIR,—I am quite ready to testify to the utility and correct working of the Grass-cutting Machine you made for me two years ago. It has now been at work the whole of last season, and up to the present period of this one, cutting a space of three imperial acres once a week regularly, in about four hours each time, the force employed being one man and a pony only. The Machine has not yet required sharpening, and I am satisfied it will continue to work the remainder of this season without doing so. I am, your obedient servant,

"Mr. Shanks. W. L. LINDSAY CARNEGIE."

Letter from Mr. Lindsay Carnegie.

[Copy.] "Kinblethmont, April 25, 1844.

"SIR,—Two years' experience of the Grass-cutting Machine you originally made for me have fully confirmed the opinion I have already expressed to you of its efficiency and economy.

"I am, Sir, your obedient servant,

"Mr. Shanks. "W. L. LINDSAY CARNEGIE."

AGRICULTURAL COLLEGE, &c.

AT A PUBLIC MEETING for establishing a system of education adapted to Agricultural pursuits, held at Cirencester, the 22nd instant, Earl Bathurst in the Chair, the Report of the Provisional Committee of the Cirencester and Fairford Farmers' Club, and the Prospectus of a Plan for establishing an Agricultural College, issued by that body was read.

1st Resolution, moved by Earl Ducie, and seconded by Mr. Kearsey.—That it is expedient to provide an Institution in which the rising generation of farmers may receive instruction, at a moderate expense, in those sciences, a knowledge of which is essential to successful cultivation; and that a Farm form part of such Institution.

2nd Resolution, moved by Sir John Paull, and seconded by A. Goddard, Esq.—That the following gentlemen be a Committee, with power to add to their number, to determine on a Plan of such an Institution—the best means of carrying the design into effect—and whether by Act of Parliament, Royal Charter, or otherwise; and report to a future meeting; and that the Prospectus submitted to this meeting by the Cirencester and Fairford Farmers' Club be referred to the Committee:—

Earl Bathurst
Earl of Ducie
Sir Michael Hicks Beach, Bart.
W. H. Hyett, Esq.

Mr. William Tuke, Bradford.

With power to add to their number.

BANKERS.—The York City and County Banking Company.
STANDING COUNSEL.—H. Bellenden Ker, Esq., Lincoln's-inn.
DRAINING ENGINEER.—James Smith, Esq. (Deanston.)
SOLICITORS.—Messrs. Blanchard, Richardson, and Gutch, York.
SECRETARY.—John H. Charnock, Esq., Wakefield.

This Association is formed for the purpose of affording to the Agricultural Interest, by means of its collective capital, the funds necessary for the THOROUGH DRAINING OF LAND; and of executing and superintending the execution of the works required for this purpose on the most economical and effective principles—repayment of the money advanced to be made, with interest, by such equitable half-yearly instalments as in the several cases may be determined.

Among the various objects to which of late years collective capital has been more or less successfully applied, it is not a little surprising that the one which, of all others, offers the most certain and profitable return, with the soundest security, should have hitherto been almost disregarded. The time, however, has arrived, when an urgent desire for Agricultural improvement on the one hand, and a dearth of safe and profitable investment for superabundant capital on the other, renders such an Association highly desirable to both the landed and monied interest, whilst to the community generally an almost incalculable advantage will be secured by a proportionate increase of labour and food.

At a meeting of the council of the Yorkshire Agricultural Society, held in York, on the 20th of December, 1843, a resolution was passed, approving generally of the objects of this Association, and at the monthly meeting of the Wakefield Farmers' Club held on the 5th January, 1844, a resolution approving of the principle and objects of the Association, was unanimously adopted.

At the meeting of the Royal Agricultural Society of England, at Liverpool, in July, 1841, Lord Stanley remarked—that "there was no bank in the whole country—no commercial speculation—no investment so safe, so sure and profitable, as that in which even borowed capital may be engaged, by investing it under the ground of your own soil." And in reference to this Association, his Lordship, in a letter to the Committee says:—"I am fully satisfied of the benefits which such an Association is capable of conferring on the country, if confined to its legitimate object—the lending of capital on the security of an investment in draining; and I think it very probable that many landed proprietors would avail themselves of the facilities afforded by an institution lending money on land, repayable by instalments—a condition on which few private parties are willing to lend.

Bearing in mind the important objects of the Association, and the perfect security with which its operations can be conducted, at a comparatively trifling expense (no large expenditure for previous outfit being required), it may be reasonably expected that the return for the capital embarked will be such as to insure the support of prudent and permanent investors, thereby divesting it of that speculative character which has stigmatised so many modern projects, and which it is the especial desire of the Committee to avoid.

Application for prospectuses, and further particulars to be addressed to the Solicitors, Messrs. BLANCHARD, RICHARDSON, and GUTCH, York; or to J. H. CHARNOCK, Esq., the Secretary, Wakefield.

CLEAR WHITE GLASS MILK-PANS.

APSLEY PELLATT, FALCON GLASS WORKS, Holland-street, Blackfriars-road, having made further experiments, is able to reduce the price of the Milk-Pans—as described in the *Gardener's Chronicle*, of clear white flint glass, which is far superior to the foreign green glass—to 5*s.* 6*d.* each, or 3*l.* per dozen.

DRAINAGE OF LAND.—WORKMAN'S LEVEL. Invented by Mr. BAILEY DENTON. This Level is constructed on a new principle, without a spirit tube, and cannot be put out of adjustment. It enables workmen to preserve a uniform fall, and, without the complexity of a spirit-level, has all its accuracy. Price 30*s.* Address, WM. ROBERTS, Land Surveyor, 8, Edward-street, Hampstead Road, who tests each instrument before delivery.

100 CUCUMBER AND MELON BOXES AND LIGHTS for Sale. One, Two, and Three-light Boxes and Lights of all sizes ready for immediate use—best materials: packed and sent to all parts of the Kingdom by JAMES WATTS, Sash Manufacturer and Hothouse Builder, Claremont-place, Old Kent-road. Garden Lights glazed and painted complete, from 1*s.* per foot.

HAYMAKING SEASON.—Agriculturists, and others who may require the assistance of WEDLAKE'S PATENT DOUBLE-ACTION HAYMAKING MACHINE, are requested to send their orders early to the London Depôt, No. 118, Fenchurch-street, opposite Mark-lane, where one of the Machines may be inspected.

BERDOE'S SUPERIOR LIGHT WATERPROOF FROCKS for the present season.—An extensive variety of the above, in NEW and greatly improved materials (in lieu of the unsightly rubbish made by Slopsellers), now ready; guaranteed to exclude any rain whatever, and confidently recommended to those who regard a respectable appearance, or wish to avoid disappointment and vexation. First-rate Clothing of every description upon the lowest terms possible, consistent with true economy and ultimate satisfaction.—W. BERDOE, Tailor, Waterproofer, &c., 69, Cornhill (North side).

DRYING BOTANICAL SPECIMENS.—The great inconvenience experienced by Botanists from the want of suitable PAPER FOR DRYING PLANTS, has induced W. and T. BENTALL to direct their attention to the Manufacture of an article expressly for the purpose. They now have the pleasure of offering a Paper which they hope will be found to possess all the requisite qualities, and to be peculiarly adapted for the purpose.

The numerous flattering Testimonials W. and T. B. have received from their friends enabling them to recommend it with confidence, they respectfully solicit the patronage of the Botanical public whose interests they are endeavouring to serve.

To be had of the Manufacturers, price, per ream, 20*s.*; half-ream, 10*s.* 6*d.*; delivered free in London—size of sheet, 20 inches by 12, when folded. Specimens of the Paper will be forwarded on application, and all orders promptly executed.—Paper Mills, Halstead, Essex, April 30.

MINIATURE GREENHOUSE, or PORTABLE CONSERVATORY, FOR THE DRAWING-ROOM.—H. HEWETSON has manufactured a good assortment of the WARD CASE, now so much and deservedly admired; and he begs particularly to call the attention of amateurs to one he has recently made, with 12 sides, and which has been so highly spoken of in the *Gardeners' Chronicle* of the 9th March (No. 10).

At HEWETSON'S Zinc Manufactory, 57, Cannon-street, near London Bridge. Horticultural articles of every description made on the premises to the taste of parties ordering them.

EXTRACT FROM OLD MOORE'S ALMANACK for MAY, 1844.—"CARE OF HEALTH.—The human frame often suffers greatly during this season, the hurtful influence of which is assisted by the premature adoption of the dress of summer. Those on whom the blight of consumption has fallen, frequently sink under it about this period, though the disease had commenced its ravages many weeks or months anterior to its fatal close. All unnecessary exposure on the part of such delicate persons to the morning and evening chills, should be carefully avoided. Also the full and plethoric will be benefited by the use of cooling medicines as PARR'S LIFE PILLS, and very temperate diet; as a tendency of blood to the head is not uncommon among such, giving rise to apoplexy and other fatal diseases of the brain. Young and stout persons even require some cooling purgative, as PARR'S LIFE PILLS, which will lessen the heat of the skin, and perfectly cleanse the system."—PARR'S LIFE PILLS are sold by all respectable Medicine Vendors. See the words PARR'S LIFE PILLS, in White Letters on a Red Ground, on the Government Stamp.—Sold in boxes at 1*s.* 1½*d.*, 2*s.* 9*d.*, and family packets 11*s.* each.—T. ROBERTS and Co, 9, Crane-court, Fleet-street.

NEW GARDEN NET, 1½*d.* per yard, second-hand do., ¾*d.* per yard, quite perfect; Garden Net, ½ inch mesh, warranted to protect the blossom, 2½*d.* per yard; a fibrous Hemp Net, New Hemp Net, 36 meshes to an inch, 7½*d.* per yard; Worsted and Woollen Nets, Net to fence out Hares and Rabbits, 2*d.* per yard, tarred; Tarpauling Frame Pit and Greenhouse Covers, 1*s.* per square yard; Long Hare and Rabbit Nets on Cords, 50, 80, and 100 yards long. Upwards of 1000 London Policemen's Capes, 2*s.* and 2*s.* 6*d.* each, for Labourers, Gardeners, and Farm-servants. Flags, Banners, &c.

TO FARMERS.—Sheep Net nearly 4 feet high, 4½*d.* per yard, of strong cord; Rick Cloths dressed with a pliable composition of Tar and boiled Oil, which never mildew or are touched by vermin, as follows:—for 30 tons of Hay, 30 feet by 30 feet, 5*l.*; 40 tons, 36 feet by 30 feet, 6*l.* 10*s.*; 50 tons, 36 feet by 36 feet, 7*l.* 10*s.* complete with side-lines. Early orders are respectfully solicited for these Rick-cloths, to prevent disappointment. Dressed Wagon and Hay Cart Cloths. Expanding Tents (the only maker) for Lawns, &c., 36 feet round, 6 feet high in the lowest part, 5*l.*; 42 feet round, 6*l.* 10*s.*; 24 feet round, 4*l.*, put up or down in a few minutes, and require no side-lines. Fishing-Nets of all kinds. Nets to cover in Pheasants, Poultry, &c., 2*d.* per yard. Nets made to order. ROBERT RICHARDSON, Net, Tent, and Rick Cloth Maker, 21, Tonbride-place, New-road, corner of Judd-street, London.

GREAT WESTERN RAILWAY.—On Wednesday, the 1st May, 1844, the Railway was completed to Exeter, and the alterations for the Summer Trains commenced.

Trains will leave Exeter at

8.15 A.M.
10.15 A.M.
11.30 A.M.
3.15 P.M.
10.15 P.M., Mail
} For London, Cirencester, Bath, and Bristol.

7 A.M.
5.15 P.M.
} For Bath and Bristol.

And the following changes will also take place:—

The 2.45 P.M. Goods Train, from Bristol to London, will leave Bristol at 2.30 P.M.

The 7.30 A.M. Train, from Bristol to Exeter, will leave Bristol at 7 A.M.; and the 7 P.M. Train will leave Bristol for Exeter at 6.50.

On Sunday the 9 A.M. Train will leave Bristol for Exeter at 7 A.M.; and the 10.50 A.M. Train will leave Bristol at 9.20 A.M.

On Week-days there will be an additional Train from Paddington to Slough at 6.30 P.M.; and on Sundays at 8.30 A.M.

The 3.45 Maidenhead departure for London will be altered to 6 P.M. from Slough.

The 7.30 Maidenhead Train will leave at 8.30 P.M. for London.

The Train from Cirencester at 5.50 P.M. will start for London at 6.45 P.M.

Time-bills may be had at any of the Railway Stations on and after Saturday, the 27th April.

By order, C. A. SAUNDERS, Secretary.

WORKS
ON AGRICULTURE, LAND-SURVEYING, NATURAL HISTORY, & SCIENCE.

PRINTED FOR

LONGMAN, BROWN, GREEN, & LONGMANS.

AN ENCYCLOPÆDIA of AGRICULTURE; comprising its History in all Countries, the Principles on which Agricultural Operations depend, and their Application to Great Britain and similar Climates. By J. C. LOUDON, F.L.S. Fourth Edition, 8vo, nearly 1,300 Woodcuts, 2*l.* 10*s.*

THE FARMER'S ENCYCLOPÆDIA, and DICTIONARY of RURAL AFFAIRS; embracing all the recent Discoveries in Agricultural Chemistry; adapted to the comprehension of unscientific readers. By CUTHBERT W. JOHNSON, Esq., F.R.S. 8vo, Woodcuts of the best and most improved Agricultural Implements, 2*l.* 10*s.*

"Cuthbert Johnson's 'Farmer's Encyclopædia' is one of the best books of its class."—*Gardeners' Chronicle.*

ELEMENTS of PRACTICAL AGRICULTURE. By DAVID LOW, Esq., F.R.S.E., Prof. of Agriculture in the University of Edinburgh. Fourth Edition, greatly improved. 8vo, 200 woodcuts, 21*s.*

'Low's Elements of Practical Agriculture,' is the best work on Farming in our language."—*Gardeners' Chronicle.*

GEORGE BEAUMONT, Actuary.

News of the Week.

THE recall of Lord Ellenborough from the office of Governor-General of India, which was announced in our Parliamentary news last week, has been again a leading topic of discussion. In the Commons, Sir R. Peel has declined to state the precise grounds of the recall, but he admits that the East India Directors have full power by law to take such a step; that they had given the Government ample notice of their views, and that the question was at length decided by an unanimous vote. In the Lords, the Duke of Wellington expressed his disapprobation of the measure in very decided terms, and condemned it as an act of indiscretion the most remarkable which he had ever experienced. Lord Ripon also has confirmed the impression produced by the Duke's speech, by the announcement that Lord Ellenborough's recall has not met with the approbation or sanction of the Government. The Court of Directors therefore, for the first time in the history of India, have placed themselves in direct collision with the Ministers of the Crown. The great majority of the Court are not only Conservatives, but very decided supporters of the present Cabinet. It is consequently manifest that they have not taken this extreme step on merely political grounds, but beyond this nothing whatever has transpired. The recall, however, is undoubtedly valid, and Lord Wharncliffe and Sir James Graham have already been announced as candidates for the vacant office.—On Monday the Chancellor of the Exchequer brought before Parliament his annual budget, and showed that the actual receipts of the past year had exceeded his calculations by the sum of 2,700,000*l.*, or in other words that the national income, which he had last year expected to produce 50,150,000*l.* had realised 52,835,124*l.* The actual expenditure had also fallen considerably within the estimate, so that instead of the 700,000*l.* surplus which he predicted 12 months ago, the actual surplus of receipts over disbursements for the year ending 5th April, was 4,160,000*l.* From this gross surplus on the past year, 2,749,000*l.* the deficiency of last year being deducted, the net surplus available was 1,400,000*l.* For the current year he calculated on a surplus of 3,146,000*l.*, and therefore proposed a reduction of duties on glass, vinegar, currants, coffee, and marine insurances, amounting to nearly 400,000*l.* In regard to the Income Tax, he proposed to defer the consideration of its continuance until next year, when the three years, for which it was enacted, will expire; but from the discussion which followed, there is little doubt that the Tax will then be continued for two years longer. The Chancellor of the Exchequer has also brought in a Bill regulating the Savings Banks, and Lord Cottenham has also introduced an important measure, altering the law of Debtor and Creditor, and abolishing imprisonment for debt. For the details of these and other measures we must refer to our report. The Irish State Trials still make but slow progress, and as there is little doubt that the present motion will be prolonged to the end of term, it is rumoured in Dublin that Government will very probably be unable to obtain judgment until Michaelmas.

The arrival of the Overland Mail has put us in possession of recent news from India and China. The mutiny of the troops was more extensive than was at first announced, but it is said to have ceased on the payment of extra batta. The Governor-General had returned to Calcutta, and India generally is tranquil.

Home News.

COURT.—Her Majesty and Prince Albert, and the King and Queen of the Belgians, left Buckingham Palace on Saturday for Claremont. The Royal party returned to town in the afternoon, with the exception of the King of the Belgians, who remained at Claremont until Monday. The Queen held a Court at Buckingham Palace on Monday, at which two special ambassadors from Sweden and Bavaria had audience of her Majesty. The King and Queen of the Belgians left town on Tuesday on their return to Brussels, and embarked at Woolwich under the customary salutes. After the departure of their Majesties, the Queen and Prince Albert visited the gardens of the Royal Botanic Society in the Regent's Park. Her Majesty's tenancy of Osborne-house, in the Isle of Wight, commenced on Wednesday, but at present it is uncertain when her Majesty will visit that place. The residence will be the private property of the Queen, and no public money whatever will be expended upon it.—The Emperor of Russia is expected to arrive in this country a few weeks hence, on a visit to the Queen. His Majesty will occupy a portion of St. James's Palace, where preparations are already making for his reception.—Col. Wylde has succeeded Col. Bouverie as Equerry in Waiting on Prince Albert.

The *Queen Dowager* has been suffering from indisposition for the last few days, arising from an extensive

attack of erysipelas over the left arm, the consequence of an injury to the wrist joint. The inflammation however has now subsided, and her Majesty is daily getting better. —The *Duchess of Gloucester* is also suffering from pain in one of her arms, the effect of a fall.

Parliamentary Movements.—The election of a member for Horsham, in the room of the Hon. Mr. Scarlett, now Lord Abinger, took place on Wednesday, when Mr. Hurst, of Horsham Park, who has represented the borough on three occasions, was elected without opposition.

Official Movements.—There is a rumour in political circles that Lord Wharncliffe will probably be appointed Governor-General of India in the room of Lord Ellenborough. It is said that Mr. Sergeant Goulburn, brother of the Chancellor of the Exchequer, is to succeed the late Mr. Merivale as one of the Commissioners of the Court of Bankruptcy.

The Church.—The Rev. Edward Field, D.D., was consecrated Bishop of Newfoundland, in the chapel of Lambeth Palace, on Sunday last. He was presented to the Archbishop of Canterbury by the Bishops of Bangor and Worcester, the Bishop of London being the other consecrating Bishop. Several clergymen were present, and among them the Rev. D. Jarvis, of the diocese of Connecticut, United States.

Foreign.

FRANCE.—The questions of Prison Discipline and of Secondary Instruction, are the leading topics of the Paris papers. On Friday, the Chamber of Peers was still occupied in the discussion of the Education Bill. M. de Montalivet made another violent speech against the University, in the course of which he declared that the majority of those educated at the University were sceptics and unbelievers, and that among a hundred young men who terminated their studies in that institution, scarcely ten Christians could be found. He was followed by the Count Portalis and the Minister of Public Instruction, after which the debate was adjourned. In the Chamber of Deputies, after a speech from M. de Tocqueville, the principle of the Prisons Bill was adopted, and the discussion of the separate articles commenced, and was likely to last for some days. We have already noticed the two elections, at Louviers, of M. C. Lafitte, the banker, which have been annulled by the Chamber, owing to his having engaged to procure his constituents a railroad communication between Louviers and the Paris and Rouen Railroad. M. Lafitte has been a third time returned at Louviers, by a very considerable majority. The question of admitting him to take his seat again came under discussion on Monday. On the division, the question was decided against M. Lafitte, on a very small majority, 167 voting in his favour, and 185 against him. The debate was a very animated and personal one, and the question itself has created an immense sensation throughout France.—The Academical Council of Paris has passed judgment on some of the students who went some time ago to compliment M. Lafitte and M. Beranger, as noticed in this Paper at the time. M. J. Gouache, a student of law, is expelled from the Faculty of Laws for two years. The examinations of M. Quercy are postponed for six months, and two others have minor punishments inflicted upon them.—The Paris and Provincial subscriptions hitherto raised for the "sword of honour" to be presented to Admiral Dupetit Thouars, are reckoned by the *National* at about 23,000 francs.—The Duchess of Kent arrived at the Tuileries on Thursday afternoon. The King's carriages were waiting at St. Denis for the Duchess and her suite. Her Royal Highness was accompanied on her entering Paris, by the Count de Strada, the King's equerry. She occupies during her stay the apartments usually occupied by the King and Queen of the Belgians. On Friday her Royal Highness received the diplomatic corps in the Salle du Trône, and was accompanied during the ceremony by the Queen, the Duke de Nemours, and Madame Adelaide. On Saturday, her Royal Highness, accompanied by the Royal family, visited the galleries of the Louvre, and on the same day received the ladies and gentlemen of the household of their Majesties and the other branches of the Royal family. After the reception, her Royal Highness, attended by her suite, accompanied their Majesties to St. Cloud. After inspecting the palace, gardens, and park, the Royal party visited the porcelain manufactory at Sèvres, and returned to dinner at the Tuileries. On Sunday morning her Royal Highness attended divine service at the English Episcopal Chapel, and on Tuesday was present at a part of the debate on the Secondary Instruction Bill in the Chamber of Peers, and afterwards inspected the Luxembourg Palace. In the evening the "receptions" customary on the eve of the King's *fête* took place, and on Wednesday the Foreign Ministers, all the great Officers of State, and other public functionaries attended at the Tuileries to pay their respects to the King, the Duchess of Kent being present at all these ceremonies. Her Royal Highness will visit Versailles, Fontainebleau, and the other Royal Palaces before she quits France, which will not be, it is said, for some weeks.—The King visited Dreux a few days since to preside at the removal of the deceased members of the Royal Family to the tombs prepared for them in the newly-constructed chapel. On Tuesday after high mass, celebrated by the Bishop of Morocco, the mortal remains of the Duke of Orleans and of Princess Marie were deposited in the vaults of the chapel in presence of his Majesty, who bore that painful trial with the utmost fortitude.—It is stated that an offer has been made to the Government, by an Anglo-French company, for the execution of the line of railway from Lyons to Avignon. There is no doubt that a proposition the result of which if accepted would be the completion of the entire line from the North Sea to the Mediterranean, will be received by the Government, the Chambers, and the public, particularly if, as it is stated, this company offers to execute the line without calling for assistance from the State.

SPAIN.—Accounts from Madrid of the 23d ult. state that reports of an impending change in the Ministry were still circulated, with some appearance of foundation. General Narvaez figured on the new list as President of the Council and Minister of War; M. Gonzales Bravo was to resign the Foreign Department to M. Miraflores; M. Carasco, the Finances, to M. Mon; and M. Portillo, the Marine, to M. Pidal. Messrs. Mayans and Penaflorida were the only two members of the present Cabinet who retained their offices. It appears that the royal visit to the baths of Catalonia has been postponed till the middle of May, and that it is now probable their Majesties will abandon the plan of visiting the north, and will probably go to the baths of Echavalite, Guipuscoa. There are several reasons alleged for this change. It is thought by some to be owing to the Ministerial embarrassments, which are becoming every day more complicated; by others that the Carlists have made so serious a demonstration among the mountains of the north, that it is not safe for their Majesties to visit that part of the kingdom. Both these stories are currently believed: but no one credits the only reason alleged by the Ministry for the change of plan, namely—that the young Queen's physicians disapprove of the Catalonian baths in her case.—Queen Christina and Queen Isabella are doing all they can to make themselves popular with the Army. They not only review the troops, but they visit them in their barracks, taste their food, and make other demonstrations of the interest which they feel in them.—A violent shock of an earthquake was felt at Lugo, in Galicia, on the 19th ult., at 45 minutes past three o'clock p.m. It proceeded from north to south, and the oscillation was so strong that the houses were shaken throughout the town as if by a loud discharge of artillery. The waters of the Minho, near the thermal springs, seemed to be in a state of ebullition. Early in the morning the atmosphere was loaded on the side of the north, and a very strong wind blowing in that direction raised a cloud of dust, which drove the inhabitants from the streets. The barometer marked fine weather, and the thermometer (Reaumur) stood at 13 degrees, about 60 of Fahrenheit. Such phenomena being very unfrequent in that country, the inhabitants were greatly frightened by it.

PORTUGAL.—The intelligence from Lisbon represents matters in that country as going from bad to worse. Count Bomfim is still in possession of Almeida, with no prospect of his capture or surrender. One of his most active officers, the Deputy José Estevao, had left Almeida, with some officers, to take the command of Guerilla parties, which appear to be springing up in several directions. The constitutional guarantees were again suspended, and also the liberty of the press, till the end of May; martial law was proclaimed, and the wholesale transportation of state prisoners, without being brought before judge or jury, or even informed of the offence laid to their charge, has been twice put in practice. This transportation of prisoners to the coast of Africa at this time of year, and their confinement at the commencement of the sickly season in the dungeons of the fortresses in the sands and swamps of Africa, is just consigning two-thirds of them to death within a term of six or eight months. Among the number of those now transported are ten officers, an editor of one of the Lisbon papers, a member of the Chamber of Deputies and President of the Tribunal of Commerce, and an eminent lawyer who had distinguished himself as advocate of the press in former prosecutions. These acts have roused the people in all quarters, and a proclamation has been secretly circulated in the name of the young Infante Don Pedro, as King. A crisis appears to be at hand, but what the catastrophe will be no one can venture to anticipate.

ITALY.—The German papers in their correspondence from Italy, state that the Cabinet of London is desirous of obtaining from the Pope an apostolic letter of exhortation to the Irish Catholics. Lord Ashburton has, it is said, stirred himself on this important subject; but as Great Britain has not a diplomatic representative at Rome, it is added that Prince Metternich has been requested to use his influence.—The papers mention that an attempt to assassinate the King of Naples has been the subject of conversation in that city. A soldier who had been admitted to an audience of His Majesty requested the officer on guard to allow him to return, as he wished to reveal to the King a conspiracy that existed to assassinate him. The officer thought he perceived the handle of a pistol, which was partly hid by a handkerchief, in the man's hat, and on seizing it he tried to escape, but was pursued and taken. The pistol was loaded, primed, and even cocked; and a second was found in his pocket, with a phial containing poison. On undergoing an examination, he made a long story about the King receiving a petition from him four years ago to promote him to the grade of officer, to enable him to marry a girl whose parents would not consent to the union unless he were an officer, and that if the King refused him now, he intended to shoot himself in the King's presence! His Majesty appears, under all circumstances, to have had a narrow escape, but unwilling to suppose himself an object of assassination, his Majesty has judiciously ordered the serjeant to be tried for desertion, and bearing prohibited fire-arms.—A letter from Leghorn, dated the 22d ult., mentions that the Austrian garrisons of Ferrara and of Comachio had been reinforced, and that the Imperial troops already occupied the legation of Ferrara; so that in less than 24 hours they could invade the provinces of Bologna and Ravenna. It is reported that the son of General (Prince) Nugent, Governor of Trieste, had been arrested. Considerable activity was observable in the military department of Naples. The garrisons of the principal towns had been renewed by the King's orders, and several companies of Swiss soldiers stationed in the forts.—Cardinal Pacca, the senior member of the Sacred College, died at Rome on the 19th ult., in the 88th year of his age.

MALTA.—A Malta letter of the 15th states that Baron Emile Bandiera, the son of the Austrian Admiral, who had identified himself with the Italian insurgents, had been compelled to quit the island, and had returned to Corfu, where an asylum was also refused him. He intended, says the letter, to proceed to London, where his brother Attilius, who is at Syra, will join him.—The trial of Mr. Penrose, clerk in charge of the Polyphemus, for forgery and embezzlement, has terminated in his condemnation to hard labour at the public works for ten years with a chain.

TURKEY.—Accounts from Constantinople have been received to the 10th inst. A serious altercation, followed by a challenge, had taken place between the French and Belgian Ministers at the Ottoman Court. There has, however, been no bloodshed, for Sir S. Canning, having invited both the belligerents to dinner, after mutual explanations, they were prevailed upon to shake hands. The most frightful disorders still continue in Albania. By the last accounts a Turkish force amounting to 11,000 men, was shut up in Uscup by an Albanian army of 60,000. Seventy Albanians have been brought in chains from Adrianople for punishment. The accounts from Syria announce that 200 inhabitants of Hasbeya, a village situate at the foot of Mount Lebanon, had abjured the Greek orthodox religion to embrace Protestantism. The Greek Patriarch and the Bishop of Damascus called on the Pasha to check the proselytising spirit of the missionaries; but he replied that he had no right to interfere, so long as the Syrians paid him the *harachie*, or capitation tax. The British consul, Mr. Wood, was also applied to, but he declared that he had received from his Government no instructions for such a contingency.

BARBARY.—The Paris papers contain lengthened statements touching the conduct of Sir Thomas Reade, the British Consul-General at Tunis, who is charged with not merely surrendering a British subject for trial before a Mussulman tribunal, but with absolutely demanding of the Bey that such course be pursued, instead of having the alleged offender, a Maltese, tried by a competent and regular British tribunal, as provided for by existing treaties between the Christian Powers and the Barbary States. The crime of the accused Maltese was murder, committed on two persons, one of whom was a Mussulman. There is no doubt of the fact that our Consul handed over the accused to the native tribunals, and that they condemned him to death. The French Consul, however, claimed and rescued him from the hands of the Tunisine authorities, under the plea that as the King of the French was the protector of Christianity as well in Barbary as in the East, it behoved him so to do, especially as the man had been abandoned by his own Consul, and had put himself under the protection of the Consul of France. A French steamer of war was immediately dispatched to Toulon, to report the Consul's proceedings, which are likely to create some stir.

INDIA AND CHINA.—Accounts from India reached town on Thursday with news from Calcutta of the 14th and from Bombay to the 13th of March, brought by the Bentinck steamer, which reached Suez on the 12th of April; they were brought to Marseilles from Alexandria direct by the French steamer. The most important military news relates to the refusal of one Madras and two Bengal regiments to proceed to Scinde on finding that they were not to be allowed full batta. There is nothing of importance from Lahore and Affghanistan, but it is supposed that these two states will shortly come to open hostilities. The Sesostris arrived at Bombay on the 10th March from China, which country she left on 15th Feb., having on board, amongst other passengers, Maj.-Gen. Schoedde. The town of Victoria was quite healthy, and it was hoped that the ensuing summer would not be so fatal as the last. Several daring attempts at robbery had been made at Hong-Kong. Sir H. Pottinger had evinced an earnest desire to act up to the treaty with China. Her Majesty's 55th Regiment was under orders for immediate embarkation for England. H.M.'s ship Dido, Capt. Keppel, left for Calcutta on the 2d of February, having on board Lord Saltoun, late Commander of the Forces, who arrived at Suez in the Bentinck, and will proceed to England by the Great Liverpool. Little was doing in teas, on account of the high prices demanded. The Governor-General arrived at Calcutta on the 28th Feb., and on the 29th published a most liberal grant of batta to all the troops that were engaged in Gwalior and in Scinde. India in general is tranquil. A Calcutta letter of March 15, quoted by the *Portafoglio Maltese* of the 23d April, says.—"The province of Scinde is finally annexed to the British possessions, after many years of nominal independence." The same letter rates at twelve the number of Native regiments that had mutinied; but adds that order had been restored among them on their receiving a gratuity.

Parliament.

HOUSE OF LORDS.

Friday.—On the motion of the LORD CHANCELLOR, the Dissenters' Chapels Bill was read a second time.—In reply to Lord NORMANBY, the Earl of RIPON stated that the Court of Directors of the East India Company had exercised the power the law gave them to recall the Governor-General of India at their will and pleasure; and that Lord Ellenborough had been by them recalled. To an-

other question by Lord COLCHESTER, the Earl of RIPON replied that this act of the Court of Directors had not met the sanction or approbation of the Government.—Lord BROUGHAM expressed an opinion that so absurd and repugnant a power as this which the law vested in the Court of Directors should be considered and revised by the Legislature.—The Marquis of NORMANBY, under the circumstances of Lord Ellenborough's recal, withdrew his notice of motion for papers concerning Gwalior, which stood for Monday.—Lord PORTMAN moved the second reading of the Landlords and Tenants Compensation Bill.—Lord BEAUMONT moved the second reading that day six months.—The Duke of RICHMOND supported the Bill, but suggested that it should be referred to a select committee to amend some of its details.—To this Lord PORTMAN assented.—The Earl of HARDWICK and Lord REDESDALE opposed the Bill.—Their Lordships divided: for the second reading—Contents, 27; Non-Contents, 19; Majority, 8. The Bill was then read a second time.

Monday.—Lord BEAUMONT laid on the table a Bill, the object of which was to place charitable bequests made to Roman Catholics on the same footing as charitable bequests made to Protestant Dissenters. The Bill was read a first time.—In reply to Lord COLCHESTER, the Duke of WELLINGTON stated the Government had ineffectually remonstrated with the Court of Directors of the East India Company against their threatened recal of Lord Ellenborough. His Grace said:—"I will not advert to anything on this occasion which is not notorious, or which is not to be found in Acts of Parliament; but the body which has carried into execution this act, which I must call an act of indiscretion at least, this body, as a body, has no knowledge whatever of the instructions under which this officer has acted. They have stated reasons for withdrawing him, but, as a body, all the individuals composing it—excepting those on the secret committee—have no knowledge whatever of the instructions under which the Governor-General has been acting, or of the events which have taken place in that country, excepting that which has been the general knowledge of this and the other House of Parliament, and of the whole of the public in this country, and of the world at large. Yet these gentlemen, having no knowledge of the instructions sent out, have pronounced their opinion on the conduct of this officer, and have recalled him, thus depriving the Government and this country of the best instrument—the best instrument, I repeat it again—that we could find to carry out the duties of that great office, and making no provision whatever, excepting that they should nominate another Governor-General for the performance of these duties—the responsibility of which rests with Her Majesty's Government. As I have said so much on this subject, I will, in order to illustrate this Act, just go a little further. Although I believe that this is the first time in the history of the Government of India that this measure of recall by the Court of Directors has been, on their part, carried into execution—and it will be carried into execution—it has more than once been in contemplation, but it has always been withdrawn on the advice and remonstrance of the Ministers of the day, and it is the fact that it has been in contemplation by these same gentlemen in respect to this very same Governor-General in the course of the past twelve months, and that they were prevailed upon to alter their resolution, and not to proceed to his recall. This was previous to the late great operations in Gwalior, of which your Lordships have read with so much satisfaction—operations which I am sure your Lordships will have pronounced, from the perusal of the reports which have been made, must have been founded upon the most just and discriminating measures on the part of the Governor-General."—A conversation followed on this subject, in which Lord BROUGHAM, the Marquess of CLANRICARDE, the Marquess of NORMANBY, and Lord CAMPBELL took part.—Lord Campbell's Bail in Error Bill was read a second time, and was ordered to be committed on Thursday. On the motion of Lord CAMPBELL, the Court of Common Pleas Law Process Bill was read a second time.

Tuesday.—In reply to the Marquess of LONDONDERRY, the Earl of HADDINGTON said it was not the intention of Government to propose any grant, this year, for completing the harbours of Portpatrick and Donaghadee.—Lord COTTENHAM moved the second reading of his Bill for amending the relations of creditors and debtors, and explained that its object was to extend the remedy which had been applied in 1838 to executions on mesne process, and to release debtors from imprisonment in any shape. The Bill was founded upon reports, the one made in 1832, and the other in 1840, to which the names of almost every person whose position entitled his opinion to especial attention were affixed, and who, although in each case dissenting upon other points, unanimously agreed in the recommendations which were embodied in the Bill. He described from these reports the utter ruin, in morals as well as estate, which imprisonment brought upon the debtor and his family, and showed also, upon the same authority, that this evil, to which about 5000 persons per annum were subjected, was not necessary as a protection to the commercial interest. He then entered into a review of the legislation upon the subject down to the act by which arrest upon mesne process had been abolished, exposing the inconsistency of the bankrupt and insolvent laws, and contending that imprisonment, while inflicting great and most unjust cruelty upon the debtor, had entirely failed as a safeguard to the creditor. Under the proposed Bill the debtor would be compelled to give up his property for the benefit of those to whom he was indebted, and would receive as a compensating boon an immunity from imprisonment. The distinction of the law between bankruptcy and insolvency would be removed, and the punishment of fraudulent debtors would be left to the ordinary tribunals by which the contracting debts without a prospect of paying them would be treated as a substantive offence for the consideration of a jury.—The LORD CHANCELLOR approved of the measure, and said that nothing could be more inconsistent than the existence of two distinct laws, administered by two distinct sets of Judges, for bankrupts and insolvents.—The Duke of RICHMOND hoped that imprisonment for small sums under the Courts of Requests would be abolished by this Bill.—Lord DENMAN felt happy in being able to say that the monstrous abuses of small Courts for the recovery of debts would be remedied by this measure. The Bill was read a second time, and its committal postponed for a fortnight, in order that Lord Brougham's Bill on a similar subject might be before their Lordships at the same time.

Thursday.—The Duke of WELLINGTON intimated that Government meant to maintain Holyhead as the most eligible point of communication with Ireland, but that any grant of money for the improvement of the harbour must depend on the report of the commissioners appointed to ascertain the port best adapted for the arrival and departure of the packets.—The presentation of a petition from Edinburgh, praying for the adoption of some sanitary regulations, raised a conversation between Lords Campbell and Brougham. Lord CAMPBELL termed Edinburgh the "modern Athens;" Lord BROUGHAM declared that the citizens of Edinburgh repudiated this appellation, and considered it as an insult; and Lord CAMPBELL expressed his wonder at this, seeing that the "modern Athens" had, in the person of Lord Brougham, produced an individual who was an Alcibiades, a Pericles, and a Demosthenes.—Lord CAMPBELL moved the committal of his "Bail in Error" Bill, the object of which is to permit parties to be at large pending inquiry into the legality of their sentences. He entered at some length into the subject, expressing his desire to relieve our law from the stigma of the judicial conduct of Rhadamanthus, who, on excellent classical authority, is said to have punished first and tried afterwards.—The LORD CHANCELLOR contended that this Bill was started by the Irish state trials, and was indirectly intended to protect Mr. O'Connell from the operation of the law. The Government had a comprehensive measure for the improvement of the law in the hands of the Attorney-General, which would embrace the objects contemplated by Lord Campbell's Bill, and therefore render it unnecessary. But he did not oppose it on that ground; it had been brought in to serve a particular object, and was therefore vicious in itself.—Lord BROUGHAM was desirous of seeing an amendment of the law undertaken in a comprehensive spirit by the Government, and opposed, on that ground, Lord Campbell's Bill.—Lord COTTENHAM considered the present state of the law ridiculous, absurd, and inequitable.—The Earl of WICKLOW and the Marquess of CLANRICARDE spoke shortly, the latter strongly censuring the Lord Chancellor for having assigned personal reasons for resisting the Bill.—Lord CAMPBELL replied, and the motion for going into committee was negatived without a division.

Friday.—The Marquess of NORMANBY, on the understanding that the President of the Board of Control would be in his place on Tuesday, postponed until that day his question respecting the correspondence between the Government and the East India Directors, in regard to Lord Ellenborough's recall. A great number of petitions were presented for and against the Dissenters' Chapels Bill.

HOUSE OF COMMONS.

Friday.—We gave in our last Mr. FERRAND's statement respecting Sir J. Graham and Mr. Hogg, and Sir J. GRAHAM's formal disavowal of the charges brought against him. After he had entered into particulars, distinctly and deliberately denying the truth of the allegations, Mr. J. WORTLEY suggested that an extreme value had been attached to the language of Mr. Ferrand, and hoped he would get up and say that in censuring Sir J. Graham and Mr. Hogg he had no intention of imputing wilfully corrupt conduct.—Sir R. PEEL rose, but as there was a call for Mr. Ferrand, he said he would not stand in Mr. Ferrand's way; and, turning towards him, remarked that he presumed he had nothing to add to his explanation.—Mr. FERRAND: Not in this House.—Sir R. PEEL then said that they must apply to the words of the charges the test of common sense. He undertook the office of adviser very unwillingly.—The SPEAKER here interfered, and said that according to the rules of the House Mr. Ferrand should withdraw.—Mr. Ferrand accordingly withdrew, and was followed by Sir J. Graham and Mr. Hogg, amid much laughter. The laughter was redoubled, when Mr. Borthwick was seen hurrying after them, as if anxious to prevent a collision in the lobby.—Sir R. PEEL proceeded, and after referring to various cases, that of Mr. Cobbett against himself, and that of Mr. Tierney against the then Speaker, Abbott, advised the House to treat the charges as allegations of corrupt conduct, and to censure them by a formal vote, without resorting to ulterior proceedings, such as voting them a breach of privilege, which might involve them in unnecessary conflicts with individuals. Had the charges been capable of any other construction than that put upon them, it was easy for Mr. Ferrand to get up and say so. Sir R. Peel then read the resolutions which he proposed, which, after reciting the charges, declared them to be unfounded and calumnious, and that they did not affect, in the slightest degree, the honour and character of the members implicated.—Mr. T. DUNCOMBE proposed that Mr. Ferrand should be again called in and questioned, but this proposition did not meet with favour.—Mr. FRENCH proposed, as an amendment, that as the House had, on former occasions, passed over the accusations of "thimble-riggers," preferred by Lord Stanley against his former colleagues, and of incentives to assassination, made by Sir R. Peel against Mr. Cobden, it was not expedient for the House to take notice of the language used by members. This amendment was not seconded. The original resolution was then put and carried unanimously. The House proceeded to the order of the day for going into committee on the Factories Bill.—Mr. DUNCOMBE moved that the Bill be referred to a select committee. After a discussion, in which Mr. Ward, Sir J. Graham, Mr. Hume, Mr. Escott, Mr. Palmer, Mr. Villiers, Lord Ashley, and Mr. Cobden joined, the House divided—For going into committee, 145; for Mr. Duncombe's amendment, 42; majority, 103. The House went into committee on the Bill, and clauses up to 21 were agreed to, when the chairman reported progress. The further consideration of the Bill was fixed for the 10th of May.

Monday.—Mr. ROEBUCK raised a brief conversation respecting the recal of Lord Ellenborough from the Government of India.—Sir R. PEEL said that the Company had the power of appointing the Governor-General, but subject to the Crown's approval. The usage had been to appoint him by concert between both authorities. The power of recalling him was absolutely with the Company; they had exercised it now on their own undivided responsibility, and without the sanction or concurrence of the Queen's servants. As to the responsibility which he and his colleagues might have to undertake, he must at present decline to say more than that the Government, whatever in strictness their responsibility might be, would feel it their duty to do their best for the public welfare in this matter.—After some questions put by Mr. WILLIAMS, and answered by Mr. GOULBURN, the House went into Committee of Ways and Means.—Mr. GOULBURN then rose to open the budget. He congratulated the House on the realisation of those hopes of general improvement which he had held out in his financial statement of last year. He had then taken his calculations of revenue with no sanguine or high-flown anticipation; the produce had much more than equalled them; and while a surplus of revenue was obtained on the one hand, on the other the expenditure had been less than the estimate. The surplus available was thus 4,165,000*l.* Out of this he proposed to defray the deficit of 2,749,000*l.* which was left at the end of 1843; and there would then remain a balance in the Exchequer of more than 1,400,000*l.* With respect to the ensuing year, his calculation of revenue, which in most particulars coincided with that of the year preceding, was 51,790,000*l.* The payments to be made thereout would be—for the charges of the National Debt, 30,097,000*l.*; and for the ordinary service, Naval, Military, and Miscellaneous, 17,706,000*l.*; together, 47,803,000*l.* There would also be some payments of the character of extraordinaries, being—first, a sum of about 400,000*l.*, which would be payable to the East India Company on account of the Chinese war; secondly, a sum of 200,000*l.*, which he estimated for dissents on the reduction of the Three-and-a-Half per Cents.; and thirdly, a sum of 239,000*l.* for the redemption of certain national engagements to the South Sea Company, by which redemption there would be a saving of annual interest, beside other advantages to the public. The Exchequer would then have a credit-balance of about 3,000,000*l.* This having been pretty generally anticipated, he had been pressed from all quarters with recommendations to reduce taxes of all sorts. He would gladly have done so, had he felt that he had a permanent revenue to fall back upon; but the source of the surplus was not a permanent one: it was mainly the income-tax. That tax the House would have to consider next year, in order to determine whether it should or should not be prolonged, as had originally been proposed, for two years beyond the first three; and if other taxes were now to be hastily reduced, before the operation of the tariff could be thoroughly known, the House might be left next year without an option as to the continuation of the income-tax. It was highly desirable to avoid the necessity, heretofore incurred, of borrowing heavily from the bank: he alluded to the large deficiency bills of former years. He deemed it better policy to apply the surplus of the present year to the augmentation of the balance in the Exchequer, than to seek a temporary relief in the way of diminished taxation. These were his reasons for resisting the large reductions which were pressed upon him. But there were some articles upon which remission might be afforded, with a fair prospect of making up revenue by increased consumption, and with a probability of increasing the consumption of other articles. The items which he proposed to select for such remission were glass, vinegar, currants, coffee, marine insurance, and wool; upon the aggregate of which the amount of duty to be remitted would be 887,000*l.* a year. It remained for him only to say a few words upon the sugar duties, which he should have to propose a little later in the session. The present Brazilian treaty would expire in November. He purposed, when these duties should come under discussion, to recommend that England should admit, at a differential duty of 10*s.* per cwt., the sugar of those states which do not cultivate that commodity by slave labour; thus opening a trade with the extensive countries to the east of the Cape, and effecting an extension of supply without an infraction of principle.—Mr. HUME, though admitting that the statement of the Chancellor of the Exchequer was clear and explicit, dissented from the policy pursued by the Government, especially on the subject of sugar, which he considered altogether a mistake, and in the maintenance of large military and naval establishments during peace.—Mr. WILLIAMS followed with similar comments; and Mr. BELL called attention to the operation of the tax on exported coal, which he contended was injurious both to the coalowner and shipowner.—Mr. Baring asked what would have been the state of the revenue had the income tax not been imposed? He thought that the Chancellor of the Exchequer should have stated distinctly whether or not it was to terminate at the end of the three years, or be continued for the full period of five years. He commented on the proposed reduction of duties, approving of the reduction on foreign coffee, but disapproving of the intended increase on chicory, which, he understood, was largely mixed with bad coffee, and rendered it not only usable but cheap. These, however, were small matters; not so the contemplated alterations in sugar. If they were really sincere in their abhorrence of slavery, they would not thus inconsistently and absurdly encourage it, for, depend on it, every amount of free labour sugar taken out of the European market would only leave a vacuum to be filled up by slave produce.—Sir R. PEEL declined going into details on the sugar question, till the proper time arrived, and advised the House to beware of reductions in our military and naval establishments, which might leave us unprepared for any contingency that might arise. Mr. Hume and Mr. Williams always went back to 1792, as if our estimates were to be regulated by the demands of that period, without reference to the progress making by other nations, the introduction of steam ships-of-war, &c. &c. He entered into statements to show that the coal tax had not been so injurious in its operation; and thought that it was the best policy to wait till next year, when the income tax would expire, before they announced any determination whether or not it is to be continued, as they would then be in a better position for reviewing their financial condition. He claimed credit for the proposed reductions on wool, and on marine assurances, and thought that, seeing the amount was only 400,000*l.* devoted to reductions, no better selections could be made.—Mr. LABOUCHERE spoke warmly on the contemplated alterations of the sugar duties, which he considered would prove not only fatally impolitic in principle and example, but pernicious in operation.—Mr. S. WORTLEY and Mr. P. M. STEWART joined in the debate, the latter complaining of the effect which the proposed alteration of the sugar duties would have, and affirming that the foolish regulations of the Colonial-office alone prevented the West Indies from being able to compete with any part of the world.—Lord STANLEY defended the Colonial-office and himself, contending that he had, since entering office, considerably relaxed the restrictions on the emigration of free labourers, especially Coolies, to our sugar colonies.—Mutual explanations having passed between Mr. P. M. STEWART and Lord STANLEY—Lord J. RUSSELL did not think that the Government deserved all the credit claimed for it by Lord Stanley, of having been the first to allow the introduction of Coolies into the Mauritius. He reminded the House that there was a time when the Hill Cooly question served the Ministerialists when in opposition just as effectually as any other for obstructing the late Government. He did not understand the nice morality which would refuse to admit Brazilian sugar, and yet claimed credit for giving greater facilities for the introduction of Brazilian coffee. If we interfered in this way, not only between free and slave labour, but between the species of slave employment, our morality would become the nuisance of the world. He foresaw that the Government were fast coming round to the Whig budget of 1841, with a slight difference, which would serve to cover their inconsistency for a year or two. In 1842, Sir R. Peel had applied the principle of "buying in the cheapest market" to onion seed, spices, and herrings; the time was not far distant, it was to be hoped, when he would apply it to the article which constituted the essential food of the people. If the income-tax were intended to continue for five years, it would have been better to have at once made those reductions in duties which were postponed till next year, and were intended as a compensation for it. As it was, nothing was proposed which was likely to be very dangerous to the financial interests of the country.—Colonel SIBTHORP made an attack on the Whigs, who, he said, were turned out never to come in again. In this view he approved of the appropriate reduction of the duty on vinegar. When the Chancellor of the Exchequer proposed to reduce the duty on marine insurance, he might have considered fire insurance, the duty on which was a tax of 200 per cent. on prudence.—Mr. M. PHILIPS approved of the repeal of the wool duty, and pointed out how great an advantage a similar boon would be to the cotton manufacture. He noticed, with approbation, the announced reductions, with the exception of those on sugar; it seemed as if all the morality in the country were centred in the sugar-basin and dissipated in the coffee-pot.—After some further debate, in which Sir H. DOUGLAS, Mr. C. WOOD, Lord HOWICK, Mr. HINDLEY, and Lord H. VANE joined, the Chairman put the question, and the House resumed, with the Speaker in the chair.—Sir J. GRAHAM then, in consequence of the lateness of the hour, postponed the committee on the Factories Bill till Friday.

Tuesday.—A large amount of private business was gone into in the early part of the sitting, one of the matters which provoked lively debate and divisions being the Bill for the Newbury, Basingstoke, London, and Southampton Railway, the supporters of which, however, carried it through its first stage by a large majority over the advocates of the Great Western branch.—Lord JOCELYN asked Mr. Hogg whether it was the intention of the Board of Directors of the East India Company to lay before the Court of Proprietors, or before that House, or the public, such documents as would show their reasons for the recal of Lord Ellenborough from the Governor-Generalship of India?—Mr. HOGG replied that he was not the organ of the Court of Directors in that House, though he had no objection, as a member of that body, to state his individual opinion. It was his belief, that, with regard to the production of papers before the Court of Proprietors, the Court of Directors would be influenced by the course adopted by hon. Members themselves in Parliament. He hoped that in the meantime, with reference to what had passed in another place, he might venture to express his hope that the House and the country would suspend their judgment.—Mr. ASTELL also hoped the House and the public would give the Court of Directors credit for the faithful discharge of its duties. He quite agreed with his hon. friend in reference to what had passed in another place, and however great the authority, and the influence which it would naturally have, still it was but an act of justice due to the Court of Directors that the House and the public should suspend their judgment as to the transaction.—Mr. HUME asked Sir R. Peel if he had any objection to lay upon the table of the House a copy of the correspondence with the Court of Directors upon the question, for, believing the Court of Directors had acted wisely in the step they had taken, he wanted the public to know whether they were properly attacked or not.—Sir R. PEEL replied that he could not say when that correspondence would be produced.—Mr. Fox MAULE moved for leave to bring in a Bill to regulate the administration of oaths in the Universities of Scotland, his object being to abolish the tests which honorary officers and the professors in Scotch Universities are now liable to take.—Sir A. L. HAY seconded the motion.—Sir J. GRAHAM, as a Minister of the Crown, felt it was his duty to maintain the entirety and safety of the Presbyterian Church in Scotland, as her Majesty had sworn to maintain it, and he could not, therefore, on light grounds, take any steps which he thought calculated to impair its stability. For these reasons he opposed the introduction of the Bill.—After a lengthened discussion the House divided. For the motion, 101; against it, 128; majority against bringing in the Bill, 27.—Mr. AGLIONBY moved for a select committee, to inquire into the state of New Zealand, which was agreed to.

Wednesday.—On Mr. MILES's motion for going into committee on the Masters and Servants Bill, Mr. T. Duncombe presented upwards of 150 petitions against it, and moved its committal that day six months. He complained of the manner in which it had been smuggled through its first and second readings under false pretences; for the original Bill had been so altered, under the auspices of the Home Secretary, that in its present form it was the very reverse of what it had been.—Mr. HUME suggested that the Government should allow the order for going into committee to be discharged, and should then either introduce a new Bill on their own undivided responsibility, or send the matter to a select committee to be examined into and reported on.—Sir J. GRAHAM entered into a defence of the provisions of the Bill, and declared his resolution to oppose the amendment. He took upon himself the paternity of the form of the Bill, though he denied his claim to be considered the parent of its substance.—Mr. MILES could not take upon himself to say whether the Bill was really his or the Government's—so altered was the bantling that its own father did not know it. Nevertheless, he prayed the favour of the House towards it.—Mr. GRANGER, Mr. BERNAL, Mr. ESTCOURT, Sir G. STRICKLAND, Mr. P. HOWARD, and Mr. COLLETT opposed the Bill.—Mr. G. KNIGHT, although he thought there must be something essentially bad in it, still, as his name was on the back of it, felt bound to give it his support.—Mr. R. PALMER also said a word in its behalf.—The House divided—For going into committee, 54; against it, 97; majority against the Bill, 43.—On the motion of Mr. SCOTT, the House went into committee on the Detached Parts of Counties Bill, and on the 1st clause being put, Mr. M. SUTTON proposed an amendment, having for its object the rendering of the measure consistent with the Reform Act.—Mr. SCOTT said he could not agree to this amendment.—The committee then divided, when there appeared—For the clause, 19; for the amendment, 15; majority, 4.—The House then resumed, but was counted out at 7 o'clock.

Thursday.—Mr. WYSE asked whether the opinion of Counsel, which had been delivered to the Treasury on the legality of Art-Unions, could, without inconvenience, be laid on the table of the House.—Sir R. PEEL said he had no objection personally to produce it, but the House had generally felt an objection to have the opinions of lawyers laid on the table. He thought it a good rule, and he should adhere to it in this instance. He did not apprehend that the Government had any intention of instituting proceedings against the Art-Unions. It did not rest with the Government to institute such proceedings; but he apprehended that the Art-Unions were liable to be prosecuted by the common informer.—Resolutions, in committee of the whole House were severally agreed to, affirming the reductions in the glass, vinegar, and marine insurance duties, announced by the Chancellor of the Exchequer in his budget; and leave was given to bring in Bills to effect the same.—The CHANCELLOR of the EXCHEQUER moved for leave to bring in a Bill to amend the laws relating to Savings Banks, and to the purchase of Government annuities through the medium of Savings Banks. The comparatively high rate of interest given by Savings Banks acted as an inducement to capitalists to deposit money in these institutions, and thus avail themselves of benefits intended for the humbler classes. He proposed to reduce the rate of interest from 2¼*d.* to 2*d.* per cent. per diem; to reduce the amount which can be annually deposited from 30*l.*, its present limit, to 20*l.*; to confine the amount of individual deposits to 120*l.* instead of 200*l.*, as at present; when deposits and interest amount to 150*l.* all farther interest to cease; and stricter regulations to be introduced in the matter of trusteeship, by which parties investing in the names of others, will be required to produce the signatures of all concerned in payments and withdrawals.—Mr. GISBORNE asked if any provision would be made against the fraudulent deposit of sums by the same individuals in different Savings Banks?—The CHANCELLOR of the EXCHEQUER said he had made such a provision in the contemplated Bill.—After some farther discussion, leave was given to introduce the Bill.

Friday.—Mr. HUME gave notice to move on Tuesday for copies of the correspondence between the Government and the East India Directors on Lord Ellenborough's recall.—After a good deal of preliminary business, the motion for the House to go into committee on the Factories Bill was moved; upon which Mr. ROEBUCK moved—"That it is the opinion of this House that no interference with the power of adult labourers in factories, to make contracts respecting the hours for which they shall be employed, be sanctioned by this House." He said that he preferred moving this as a resolution of the whole House, before going into committee, in order to throw upon Sir J. Graham the onus of showing why he took from the working-classes the power of contracting for themselves, and to throw upon Lord Ashley the onus of proving the advantage he proposed to confer on the working-classes by legislation. [Left sitting.]

CITY.

Money Market, Friday.—Consols closed at 99 to ⅜ for Money, and 99¼ for the Account; New Three-and-half per Cents., 102⅜; Three per Cents. Reduced, 98¾; Bank Stock, 196; India Stock, 284; Exchequer-bills, 74 to 76 prem.

BANKRUPTCY SUPERSEDED.—W. G. CLIFT, Chapel-yard, Cross-lane High Holborn, coach broker—F. FORD and F. R. BROCKLEHURST, cloth manufacturers, Bow-lane, city.

GAZETTE OF THE WEEK.—BANKRUPTS.—J. MACHAN, Somerset-street, Whitechapel, carpenter and builder—S. WILCOCKSON, Chesterfield, Derbyshire, linendraper—C. JOHNSON, Rochdale, Lancashire, lime dealer—C. NICHOLS, Wakefield, Yorkshire, bookseller—G. F. WRIGHT, Ironbridge, Salop, innkeeper—J. PERRY Birmingham, maltster—G. E. PHILLIPS, Plymouth, saddler—J. PEMBERTON, Knostrop, Yorkshire, soap-boiler—G. MURRAY, Stratford-upon-Avon, publican—J. GOULD, Sheen, Staffordshire, cheese-factor—H. ALDEN, Oxford, printer—J. GIBBINS, High street, Marylebone, carpenter, —R. BARHAM, Emsworth, Hants, linendraper—J. DIAMOND, George-street, Tower-hill, merchant—J. GROVER, Regent street, Lambeth, stone-merchant—S. JEVONS, Lincoln, shoemaker—A. SUTTON, Suffolk, innkeeper—J. H. ROBY, Manchester, coffeehouse-keeper—J. HARDING, Barnoldswick, Yorks, farmer.

SCOTCH SEQUESTRATIONS.—H. CAMPBELL, Glasgow, provision merchant.

Metropolis and its Vicinity.

New Zealand Company.—The adjourned meeting of this Company took place last week, for the purpose of receiving the report of the Directors with reference to the result of their recent application to Government. Mr. Joseph Somes was in the chair. The Secretary read the report, which filled a printed pamphlet, extending to nearly 100 pages. The following is an abstract of the principal points:—It commenced by stating that the Colonial Secretary had rejected all the proposals submitted to his Lordship without assigning the grounds of his refusal, and referred to the correspondence contained in the Appendix, as showing the Directors' proceedings in declining a suggestion made by the Colonial Department, contrasting the communications submitted by the Company with the personal reproaches of which the replies consisted. An impression prevailed among the Directors that Lord Stanley himself did not participate in the ill-will constantly exhibited towards the Company by the Colonial-office and the local Government of New Zealand. A large body of Proprietors had given in a written approval of the conduct of the Directors in declining to accept a loan of 40,000*l.* from the Government. Two letters dated May, 1843, containing an agreement entered into between the Company and Lord Stanley, had been placed in the hands of Captain Fitzroy by his Lordship, and on doubts as to their interpretation being suggested by "somebody," Lord Stanley, unknown to the Directors, furnished instructions to Governor Fitzroy, which materially altered the letter and spirit of the agreement, a course of proceeding which the Directors felt they could not too strongly deprecate, as calculated to be productive of very serious practical wrong to the Company and its settlers. The report alluded to the establishment of the seat of government at Auckland, near the end of a narrow country 800 miles long—the discouragements of the Company's settlements, and the inducements held out to settlers to re-emigrate to Auckland—these schemes the Directors had felt it their duty to resist, and hence might be inferred the reluctance with which they had consented to that part of the agreement of May, 1843, by which they engaged to take lands at Auckland and colonise there. But feeling that the interests of the settlers and proprietors were completely at the mercy of the Colonial-office and local government with regard to the vital question of land-titles, they had deemed it their duty to obtain some determination of that question, by almost any sacrifice. They had implicit confidence in Governor Fitzroy's strict sense of justice and honour; but the agreement having been altered unknown to them, they looked with alarm for news of what may have been the result. The agreement of May, 1843, was in lieu of another entered into with Lord John Russell, by which the Company undertook to surrender all claim to land acquired from the natives, and raise a further capital of 200,000*l.*, in consideration of Lord John Russell's engaging that it should receive from her Majesty a grant of as many acres as it had expended crowns in colonisation. But this agreement had always been treated by the local government as waste paper. The report then went on to describe the imperfect manner in which it alleged the local government was carried on, and instanced the appointment of a young man just 18 years of age to preside over the Court of Claims, who did not understand a word of the native language; decisions adverse to the Company and delays in this Court had produced the most deplorable results, and the Directors were of opinion that the massacre at Wairoa flowed directly from it. Paying a high tribute to Captain Wakefield, R.N., late the Company's agent at Nelson, and pointing out the tendency of the proclamations of the local Government, subsequently to the event referred to, the report described their practical effect to be, "That the colonial population now holds all property and life itself on no better tenure than the forbearance of tribes of savages." Although half a million of money had been expended in colonisation, the Company was still without a secure title to a single acre of the property awarded by Lord J. Russell's agreement three years since, and this was entirely attributable to the hostility of the Colonial Office and the local Government. Though bound to state the Company's affairs in their worst aspect, the Directors are far from believing them irretrievably ruined. Their reluctance to entertain a belief in the systematic hostility of the Colonial Office was at last destroyed, and they now recommended an appeal for justice to a higher tribunal. They rely on the flagrant character of the wrong done by Lord Stanley's interpretation of Lord J. Russell's agreement; and cannot believe that Parliament, or the Ministers collectively, decline to remedy the gross injustice. The report proceeded to say, that whatever the result of the questions at issue, the Directors were fully satisfied that British colonisation must ultimately prevail, and concluded with the expression of a hope that the whole subject of the colonisation and government of New Zealand would be thoroughly investigated by Parliament. The Directors sought the most searching inquiry into their own conduct, assured that it could not take place without tending to the removal of the threatened ruin of the Company, and the restoration of its means of accomplishing the valuable public objects which the charter of incorporation had in view. The report was unanimously adopted, together with a vote of confidence in the Directors.

King's College.—The anniversary meeting of this institution took place on Monday in the theatre of the College. His Grace the Archbishop of Canterbury presided, and was supported by the Bishops of London, Winchester, and Lichfield, Lord Radstock, Sir R. Inglis, Sir C. Price, Alderman Copeland, &c. The report of the council for the past year commenced by congratulating the meeting on the continued prosperity of the institution. The number of students in the general department of literature, arts, and law had increased during the year; and in the medical class, the class of engineering, manufactures and arts, as well as in the junior school, the increase was equally matter of congratulation. The proficiency of the pupils was evidenced by the honours they had obtained at the universities. At Cambridge six had obtained the distinction of Wranglers, five of whom were in the class of Senior Optimists. The report alluded to the loss which the college had sustained by the elevation of the late Principal, Archdeacon Lonsdale, to the bishopric of Lichfield, and the office of Principal had been filled by the appointment of the Rev. Dr. Jelf. The total receipts amounted to 24.542*l.* 16*s.* 11*d.*, and the gross expenditure to 22,788*l.* 8*s.* 11*d.*, leaving a balance of 1754*l.* 8*s.* in favour of the institution. The report having been unanimously adopted, Alderman Thompson, M.P., was proposed as Treasurer for the ensuing year. Messrs. Capel, Jones, and Twining were proposed as Auditors, and Dr. Watson as a member of the Council, in the room of the late Sir H. Halford. Before proceeding to the ballot, Lord Radstock moved a vote of thanks to the Archbishop of Canterbury, for his kindness in presiding over the meeting, which was seconded by Sir R. Inglis. His Grace, in acknowledging the compliment, said he had only to offer them his congratulations at the increasing prosperity of an institution which in fourteen years had reached a degree of prosperity even its best friends could not have anticipated. He believed that success to be owing, in a great measure, to the principles on which the College was conducted, and to the judicious care exercised by the Council of Management, and the other officers of the institution. The ballot was then proceeded with, and the above-named officers were elected.

University College.—The annual distribution of prizes in the medical department of University College took place on Saturday. The number present exceeded 1000. Lord Brougham presided, and was supported by Lord Auckland, late Governor-General of India. A report was read, in which it was stated that the number of students in the medical classes was the same as last year; namely, 300—of whom 93 had entered this year. The following distribution of prizes then took place: CHEMISTRY—Gold medal, Mr. C. W. Randell, of Reading; 1st silver medal, Mr. Edward Cousins, of London; 2d silver medal, Mr. James Morris, of London; Prize Essay, 1st silver medal, Mr. Robert Ellis, of Ruthin, N.W.; ditto, 2d silver medal, Mr. Edward Palmer, of London. BOTANY (Summer Term, 1843)—Gold medal, Mr. Charles Prentice, of Kingston-on-Thames; silver medal, Mr. W. H. Colborne, of Chippenham, Wilts. MEDICINE—Gold medal, Mr. John Gabb, of Bewdley; 1st silver medal, Mr. F. W. Marshall, of Norwich; 2d silver medal, Mr. W. H. Allchin, of East Malling. ANATOMY AND PHYSIOLOGY—Gold medal, Mr. William W. Moore, of Doncaster; 1st silver medal, Mr. H. Crocker, of London; 2d silver medal, Mr. T. A. Cammack, of Spalding. COMPARATIVE ANATOMY—Gold medal, Mr. W. H. Colborne. ANATOMY (Senior Class)—Gold medal, Mr. William Cadge, of Hoveton, Norfolk; 1st silver medal, Mr. William Brown, of Altarnun, Cornwall; 2d silver medal, Mr. W. L. Dickinson, of London. Junior Class—Silver medal, Mr. T. Littleton, of Saltash. MATERIA MEDICA—Gold medal, Mr. R. Babington, of Horncastle; 1st silver medal, Mr. J. E. Wood, of Rochdale; 2d silver medal, Mr. Edw. Cousins. MEDICAL JURISPRUDENCE (Summer, 1843)—Prize, Robt. Ellis. PATHOLOGICAL ANATOMY (Summer, 1843)—Gold medal, Mr. R. D. Harling, of Chester. MIDWIFERY—Gold medal, Mr. James Hakes, of London; 1st silver medal, Mr. Alfred Jackson, of Portsmouth; 2d silver medal, Mr. James Clifton of Broughton. SURGERY—Gold medal, Mr. Robert Ellis; 1st silver medal, Mr. H. J. M'Dougall, of Exeter; 2d silver medal, Mr. Henry Vevers, of Herefordshire. FELLOWS' MEDALS FOR CLINICAL INSTRUCTION—Summer, 1843: Gold medal, Mr. H. Fearnside, of Otley, near Leeds. Winter, 1843-4: Gold medal, Mr. F. W. Marshall; silver medal, Mr. G. S. Deane, of Liverpool. The distribution of prizes being finished, Lord Brougham rose and spoke to the following effect: He had great pleasure in presiding on that occasion, as he had in being president of the College. He was gratified in again meeting its friends, and that it was in his power to congratulate them, not only on the rising, but the flourishing state of its funds. Nor could he refrain from expressing the great pleasure he felt, when he considered the high character of the professors of the College. He had lately had an opportunity of examining the celebrated medical institution in the South of France—he meant the institution at Montpelier—and he had great pleasure in saying that this institution would not suffer from comparison. The prosperity and excellence of the institution is satisfactorily proved by the number of degrees conferred on its students by the central university. Out of the 233 cases in which degrees had been conferred, 114, or nearly one-half, had been conferred on the students of University College. In that college they had no religious observances. They had been blamed for that, and told they had too little religion. Quite the contrary. It was because we thought religion of such infinite importance that no person would compromise it, or traffic or bargain with his principles; that it was not a thing a person had any power over his own mind, to give up, or take a little more or a little less of; that, if we were to teach different sects, we must have different establishments, one for the church, one for this sect, one for another. Therefore, seeing it was utterly impossible that, with various opinions, we could join in teaching religion, it was our principle to leave religion to be taught by its able professors, whether of the church or of dissenting bodies. And whether religion is really taught in other colleges more than in ours, may be a question. At King's College, (to which I heartily wish well, for she may be considered a child of our own), medical students coming from Portman-square at two o'clock in the afternoon, may not be allowed to go in to their classes unless they also come between nine and ten o'clock to go to prayers in the college chapel. For aught I know that may be their course of proceeding; it seems a clumsy one, and one that medical students would not find it convenient to follow; but for aught I know it is the rule, or it may be called the rule, though it may be broken 365 days in the year. The financial affairs of the institution were in a most flourishing condition. The late Mr. Brundrett, a solicitor, had lately left them 21,000*l.*, and Mr. Bacon had left them, subject to the life of his widow, a sum which was expected to realise 28,000*l.*,—making with other endowments 50,000*l.*, which was now at the disposal of the council. He had no doubt whatever, at any rate he would recommend it to the council, that this great building should be now completed. He now came to the darker side of the picture. Instead of being the first, theirs was undoubtedly the last insti-

tution of the kind in reference to science and literature. When the institution was first established, the projectors did confidently expect that their magnificent establishment, in which education of the highest order would be taught at so low a rate, would be crowded with persons eager to avail themselves of such opportunities. At Oxford and Cambridge the same class and quality of education, for which they would only have to pay 25*l.* per annum at the University College, would cost from 200*l.* to 300*l.* Yet the citizens did not send their children to receive the advantage of this economical arrangement. They preferred (and he could not sufficiently express the thorough scorn and contempt he felt for their conduct)—they preferred making up a purse of 200*l.* or 300*l.* to educate one son at Oxford or Cambridge, and left all the rest of the family to grow up in ignorance. No one said that the university in which they were assembled was not in a central situation; no one complained that it was not a healthy place; and no one contended that better teachers than they had were to be had elsewhere. And yet, notwithstanding all this, the sons of the citizens rarely darkened their doors. He hoped to live to see the day when this stain on the character of the citizens should be wiped off, and when, instead of 190 young men receiving a general education, they should have, as they ought to have, at least 2000 or 3000. The Chairman, after a few remarks on the desirableness of the medical students taking care to acquire general information, concluded amidst loud and protracted cheers. Lord Auckland then proposed a vote of thanks to Lord Brougham for his conduct that day in the chair, which was carried amidst loud acclamations.

Church Missionary Society.—The annual meeting of this Society was held on Tuesday at Exeter Hall. The Earl of Chichester presided, and was supported by the Bishops of Winchester, Chester, and Ripon, Viscount Sandon, M.P., Sir R. H. Inglis, M.P., Mr. Plumptre, M.P., the Dean of Salisbury, &c. The chairman congratulated the members on the favourable aspect of the Society's affairs, and briefly reviewed its operations during the last year. The report commenced by referring to the embarrassments under which the Society had unfortunately laboured two years since, through want of support. Those difficulties had entirely disappeared without curtailing any of the missions, with the exception of the one at Jamaica, and that not to a very great extent. The operations of the Society during the year had extended to various parts of Africa, America, and the Indies, and to various other parts of Asia Minor. Missions had alsobeen formed on the coasts of the Mediterranean, and in connection with the missions schools had in most cases been founded. It was intended to establish Missionary stations in China. During the year fifty-four branch Associations had been formed, in addition to eighteen juvenile branches. The receipts towards the general fund were 97,791*l.* 2*s.* 3*d.*; the special and China fund amounted to 1556*l.* 16*s.* 1*d.* The capital fund was 2648*l.* 1*s.* 8*d.*; sum for building, &c., 1181*l.* 17*s.* The total receipts, including sundry items not classed, for the year, were 104,323*l.* 16*s.* 10*d.* The expenditure of the year was 93,472*l.* 7*s.* The report next stated, that towards the building fund for Sierra Leone, a sum of 2000*l.* had been granted, in addition to a sum previously appropriated to that purpose, making altogether 36,000*l.* The Bishop of Chester, the Rev. Professor Scholefield, the Rev. Hugh Stowell, and other gentlemen, addressed the meeting in support of various resolutions.

The Art-Unions.—On Saturday a numerous meeting of artists and others, convened by the Institute of Fine Arts, was held to take into consideration the recent announcement of Government respecting the illegality of Art-Unions. Mr. Wyse, M.P., presided and addressed the meeting at great length in favour of Art-Unions, after which petitions to Parliament praying that such associations may be legalised were adopted with only one dissentient. — The following observations on the suppression of these lotteries is from the City Article of the *Times*. "The declaration that 'art-unions' are illegal after a toleration of eight years, has excited much attention in the city, not so much on account of the embarrassing condition in which many persons are placed, as from the fact that the 'Art-Union of London' created, as it was avowed, for the benefit of art, has been quoted as a precedent for many a scheme of a much more questionable character. Lotteries for goods, holding out the tempting bait of supplying the poor with necessaries at a trifling cost, have been in vogue, and it need not be said how easily such concerns can be made a means for defrauding the humbler classes. The law on the subject was as clear and explicit as possible, and no one, who took the trouble to refer to the statutes, could question for a moment the illegality of this species of gambling, under whatever name it might be put forth, or by whatever plausible pretext it might be shielded. Nevertheless, whenever any of those concerned in lotteries on a small scale were charged with the illegality of their proceedings, they had always the answer at hand, that their principles were precisely the same as those of the 'Art-Union,' and that the high patronage bestowed on that undertaking showed it could not be vicious. Now the 'Art-Union' is formally declared to be contrary to the statutes in force against lotteries, it can no more be cited as a precedent, and the minor lotteries, if any exist now, cannot hope for any sort of shelter. It is only to be regretted that some plan of the sort was not adopted sooner, as much of the perplexity in which the highest persons in the country are placed by their connexion with the 'Art-Union' might have been saved. We did all in our power upwards of a year ago to warn every class of the illegality of every species of lottery, and to show how uncompromising were the statutes. In the *Times* of the 17th September, 1842, under this head, we commented at great length on the subject, and printed the clauses of the statutes by which the law is declared. Had the warning been taken at that time, there is no doubt that much mischief would have been prevented."

Anti-Corn Law League.—The weekly meeting of the League was held on Wednesday in Covent-Garden Theatre. Lord Kinnaird presided, and the meeting was addressed by Mr. Ricardo, M.P., Mr. Somers, a tenant farmer from Somersetshire, and Mr. Cobden.

Opening of Trafalgar-square.—On Wednesday Trafalgar-square was thrown open to the public. The workmen have, however, not yet left, as the asphalte pavement is not yet completed, nor are the *jets-d'eau* yet in play, although the basins have been charged with water for several days. The base of the Nelson column is still surrounded with a hoarding, and part of the upper scaffolding still remains. In a few days the equestrian statue of George III. will be removed from its present site, Pall-Mall East, to the vacant pedestal at the west end of the terrace in the square. The day for holding the nautical *fête*, at which the pensioners from Greenwich Hospital will be present, will be shortly appointed.

London Banks.—A return of the annual clearing payments made by the different London bankers, who send their daily claims on each other to the clearing-house to be written off, and the final balances paid, has just been published in the *Bankers' Circular*. This is an interesting document, but it is no guide absolutely to the relative rank and importance of the houses named in it. None of the West-end bankers, for example, are in the list, their demands upon the City being cleared by the City banks, and swelling by that amount the returns of those houses employed as their agents. The bill and stock-brokers' accounts have a similar effect, without being a true index of the amount of general banking business. Still, the list is valuable, as showing the enormous amount of money passing through the Metropolitan banks in a single year (1840). The following are the items:—Barclay and Co., 107,000,000*l.*; Glyn and Co., 105,000,000*l.*; Jones, Loyd, and Co., 104,000,000*l.*; Masterman and Co., 90,000,000*l.*; Robarts and Co., 80,580,000*l.*; Smith, Payne, and Co,, 64,000,000*l.*; Williams and Co., 56,000,000*l.*; Barnett and Co., 50,000,000*l.*; Lubbock and Co., 33,760,000*l.*; Stone, Martin, and Co., 33,700,000*l.*; Prescott and Co., 30,000,000*l.*; Denison and Co., 26,863,000*l.*; Hanbury and Co., 24,700,000*l.*; Ladbroke and Co., 24,200,000*l.*; Willis and Co., 20,500,000*l.*; Curries and Co. 17,500,000*l.*; Spooner and Co., 16,000,000*l.*; Price and Co., 15,300,000*l.*; Hankey and Co., 15,000,000*l.*; Barnard and Co., 12,000,000*l.*; Vere and Co., 10,428,800*l.*; Rogers and Co., 9,000,000*l.*; Dorrien and Co., 8,000,000*l.*; Fuller and Co., 7,500,000*l.*; Brown and Co., 7,000,000*l.*; Bosanquet and Co., 3,700,000*l.*; Stevenson and Co., 3,500,000*l.*; Weston and Co., 3,265,000*l.*; Total, 978,496,800*l.* This statement does not include the bills and checks either of the Bank of England, of the Joint-Stock banks, or of the bankers of Westminster.

Death of Mr. Commissioner Merivale.—We regret to record the death of this learned gentleman, under very sudden and distressing circumstances, on Thursday evening, at his residence, in Bedford-square. It appears that the deceased was in excellent health and spirits at dinner-time, and was seated in the dining-room reading a book, when he suddenly expired of apoplexy. Two of his daughters, and Mrs. Merivale, had retired to the drawing-room after dinner, and it was upon Miss Merivale going into the dining-room to request her father to join them at the tea-table, that she discovered the lifeless body of her parent, in a sitting posture, in an easy-chair. The Jury, after hearing the evidence of Dr. Hillier, of Gower-street, who was called in to attend the deceased, returned a verdict of "Natural Death." Mr. Merivale had from early life associated with his legal attainments some of the higher acquirements of a man of letters. For a considerable period he had ranked amongst the contributors to the "Edinburgh Review," and in connection with Lord Chief Justice Denman (who was his early friend and associate), the Rev. R. Bland, and the Rev. F. Hodgson, the Provost of Eton, he produced the well-known "Translation from the Greek Anthology." The last effort of his pen was a translation from the German of Schiller. In the discharge of his professional and somewhat unpleasant duties as Judge of the Bankruptcy Court, Mr. Merivale won the esteem and respect of the bar, and was universally regarded for the moderation with which he discharged the extensive powers delegated to him under the provisions of the law. Previous to the passing of this statute, he was one of the 70 judges in Bankruptcy, who held 14 independent and distinct courts; and upon the new Bankruptcy Act coming into operation, in 1832, he was selected as one of the six commissioners, at a salary of 2000*l.* per annum. He married the daughter of the Rev. Dr. Drury, head-master of Harrow School, by whom he has had eight children, and six of them are now living.

London District Post.—On Wednesday an important change in the regulation of the town posts came into operation. There are now 10 deliveries in London instead of seven only daily, which will be made up at the following hours:—morning, 8, 10, and 12 o'clock; afternoon, 1, 2, 3, 4, 5, 6, and 8 o'clock. In addition to the accommodation that this will afford the inhabitants of the metropolis, the time for posting letters to be delivered in the country districts of the London district post the same night is extended from 2 to 3 o'clock, and the time for posting letters for delivery the same evening at places within six miles from the General Post-office, is extended from 4 to 5 o'clock. The late regulation of allowing letters to be posted half an hour later at the receiving houses, Cornhill, Charing-cross, and Regent-street, is discontinued, and the hours of despatch from these offices is the same as at the receiving-houses. Letters can still be posted at the principal office, St. Martin's-le-grand, one hour later than at the receiving houses for the morning despatches, but at the 1, 2, 3, 4, 5, and 6 o'clock despatches, the time allowed is only three quarters of an hour, as the box closes 15 minutes before each despatch. The present number of twopenny postmen is 700, and the general 400.

Hampton Court.—A great sensation has been occasioned at Hampton Court Palace and its environs, in consequence of the discovery of the mutilated remains of a new-born infant, at the mouth of the common sewer which runs from the Palace into the Thames. The infant had been cut up in almost numberless pieces, and introduced into the sewer; but from the number of families occupying apartments in the Palace, and the great number of female servants attendant upon them, it will be a matter of extreme difficulty to fix the offence upon the guilty person. The general opinion is, that the mother of the infant was delivered in one of the water-closets of the Palace, and that she or a confederate there divided the body into portions, that it might pass through the pipes of the closet. Information has been sent to the Coroner, and an inquest will be held forthwith.

Respite of Mary Furley. — Mr. Sheriff Musgrove attended at Newgate on Friday to perform the painful duty of fixing a day for the execution of Mary Furley, under sentence of death for the murder of her infant child, and appointed Monday, the 6th of May. On Saturday afternoon, however, the Sheriffs received a communication from the Secretary for the Home Department, stating that her Majesty had been pleased to respite the sentence of death during her Majesty's pleasure. It will be recollected that the poor woman was convicted under circumstances of a peculiarly distressing kind; she had been long out of employ, and having no means of supporting herself or child, she resolved on destroying it, and committing suicide at the same time. The former part of her resolution she carried into effect, but was herself saved from drowning. Since her conviction several gentlemen have interested themselves in her behalf, and have represented to the Secretary of State, that under the melancholy circumstances of her case, she was a fit object for the Royal clemency. It is not at present known what her sentence will be, but it is expected that she will undergo a short imprisonment.

Murder on Battersea Bridge.—On Monday night about 11 o'clock, Mrs. Sarah M'Farlane, a widow, living in the Bridge Road, Battersea, and obtaining a subsistence by keeping a day and Sunday school, was murdered on Battersea-bridge. The supposed perpetrator of the crime is Augustus Dalmas, a Frenchman, for many years connected with some chemical works at Battersea, but who has lately been employed at a floor-cloth manufactory at Knightsbridge, and had been paying his addresses to the deceased. It appears that Mrs. Hall, the wife of one of the toll-collectors at Battersea-bridge, was standing at the toll-house at the Surrey side, about 11 o'clock on Monday night when the deceased, whom she did not at the moment know, came running up to the gate, and cried out in a faint voice, "Oh, take me home—a man has ill-used me—I've been cut—I've been stabbed." Mrs. Hall asked the deceased where she had been injured, but she could not reply. She grasped Mrs. Hall's right arm convulsively, and was in the act of falling when another woman, together with the toll-collector, caught her. A cry of "Murder" was raised, and the landlord of the Swan Tavern, which is close to the bridge, together with several gentlemen who were in the parlour, ran out, and with the assistance of the police, raised the deceased from the ground. It was then discovered that there was a gash in the right side of her neck, extending from the windpipe to the right ear, and the blood was flowing copiously. The deceased was taken into the Swan public-house, and a police-constable started for a surgeon. In the interval that elapsed before the surgeon's arrival, a police-constable, who noticed that deceased's life was ebbing fast, asked her who had cut her throat, and deceased replied in a faint voice, "Dalmas." The constable said, "Did Dalmas do it?" and the reply was "Yes." On the arrival of Dr. Connor, which was almost directly afterwards, he declared her dead. He examined the wound, and found it to be about five inches in length, extending from the windpipe to immediately underneath the right ear. It was a very deep gash, and had evidently been inflicted by a razor. None of the superior vessels, except the jugular vein, had been divided. Dr. Connor declared that the deceased could not have committed the act herself, and therefore she must have been murdered. The deceased was afterwards removed to her own residence, and measures were concerted for the apprehension of the assassin. From the long accounts published in the daily papers, it appears that the murderer is from the south of France. He has been 20 years a resident in Battersea, and has had the management of several chemical factories. He is not only a clever operative chymist, but an excellent linguist, being master of most of the modern languages. Some time since he published a work on chymistry. When he first came over he was married, and had two daughters. His wife died about 18 months since, and the deceased at that time undertook the charge of these children. Thus the intimacy originated between the parties. Some transactions in pecuniary matters caused Dalmas to abscond from Battersea; but the children still continued at the deceased's. It had been considered before Dalmas left Battersea that he would marry the deceased, who was a fine-looking woman, about 40 years

of age, and the facts contained in letters found at his lodgings are sufficient proof of an attachment existing between the parties. It further appears that Dalmas had obtained one of his daughters a situation at Brompton, and on Monday afternoon deceased took that girl to her place. It is supposed that she then called upon Dalmas, and that he walked with her as far as the bridge homewards, when some words arose respecting some men to whom he alleged the deceased was paying too intimate an attention, and that he then drew her head backwards upon his breast, and cut her throat. It is stated that after 11 o'clock on Tuesday night the murderer called upon his daughter at her new place, and said that he would commit suicide. She went down on her knees and entreated of him not to talk in that manner, and to banish such thoughts. He said he had murdered Mrs. M'Farlane, and directly afterwards rushed away from her. Notwithstanding the efforts of the Police he has hitherto eluded detection, and no trace of him from the time of his leaving his daughter has been obtained.

Removal of Convicts.—On Saturday morning, 79 prisoners who had been convicted at the late sessions of the Central Criminal Court, and sentenced to transportation, were removed in the van from that gaol to the Penitentiary at Millbank, there to undergo a short imprisonment previous to their being taken on board the transport ship, which is to convey them to Botany Bay. Among them were William Henry Barber, Joshua Fletcher, and Henry Sanders, the parties convicted of the late will-forgeries, the two former having been sentenced to be transported for life, and the latter for seven years. There were also among the female convicts the lady shoplifters, Mrs. Earnshaw and Miss Wells.

Mortality of the Metropolis.—The following is the number of Deaths registered in the week ending Saturday, April 20.—West Districts, 127; Northern, 180; Central, 147; Eastern, 171; Southern, 221; Total, 846. Weekly average for the last five years, 946.

Provincial News.

Bath.—On Friday night the cloth factory at Twerton Mills, near this town, took fire, and the centre of the building was entirely destroyed. The damage is estimated at 10,000*l.*, but the property was fully insured.

Bagshot.—On Wednesday morning the extensive plantations in the forest near Bagshot, the property of Prince Albert, which was purchased some time since by his Royal Highness, and which formerly belonged to the late Duke of Gloucester, were discovered to have been fired, and in the course of the day and night upwards of 700 acres were totally destroyed.

Belper.—This town on Monday week was surprised by the announcement that a mechanic named Yeomans, for some time past employed at Messrs. Shutt's mills, had murdered his wife, and afterwards cut his own throat. Yeomans was a married man, 50 years old, and had a family, the eldest son being married. It appears that for some time past he and his wife have not lived happily together. The jury at the inquest returned a verdict "That William Yeomans killed his wife while labouring under a fit of temporary insanity, and afterwards, during the continuance of the same fit of insanity, destroyed himself by cutting his throat." The Coroner, on receiving the verdict said, that the verdict was the Jury's, and not his, and that he thought nothing like satisfactory proof of insanity had been given.

Boston.—The large estate near this town, the property of Lord Monson, was sold last week at the Auction Mart, by Mr. George Robins, for 57,100 guineas, to Mr. Malcolm, the former M.P. for Boston. The room was crowded by capitalists.

Coventry.—On Monday week, an infant 17 months old, daughter of Mr. Golsby of the Canal Tavern in this town, was found murdered in its cradle, having been stabbed with a carving-knife. A servant girl, under 13 years of age, who had been employed as the child's nurse, is supposed to be the murderer, and has been committed for trial on the capital charge.

Deal.—The atmosphere was on Tuesday week so rarefied at this place, that Calais was plainly discernible with the naked eye. The vessels could be seen leaving the harbour without the aid of a glass.

Eton.—The ancient triennial festival of the Eton Montem will take place on Whit Tuesday, and from the increased number of scholars it will be conducted on a more handsome scale than has been witnessed on any previous occasion, there being in the college at the present time the unprecedented number of 720 students. It has hitherto been customary for the gentlemen to dine at Salt-hill, and spend the afternoon in the gardens, but on the present occasion Dr. Hawtrey, the Head Master, has arranged that, after partaking of refreshments at Bothams, the scholars shall return to the College, and dine under spacious tents to be erected on the Fellows' Eyott, where the grand promenade will take place.

Liverpool.—At the Liverpool Police Court last week Thomas Nelson was convicted in two mitigated penalties of 300*l.* each, for adulterating tobacco with China flowers and saccharine matter. The defendant pleaded guilty, and declared that he could not live by the trade without doing so. The full amount of the penalties incurred was 1800*l.* George Brown was convicted also in mitigated penalties of 200*l.* and 300*l.* for a similar offence.—On Wednesday week Mr. John Hartley was charged at the Borough Court, Bolton, with having manufactured adulterated tobacco, whereby he had incurred a penalty of 300*l.* On another clause of the act he was charged with having adulterated tobacco in his possession, the penalty for which offence is 200*l.*; and he was also proceeded against for the forfeiture of 170*l.*'s worth of tobacco seized upon his premises. After hearing the evidence, the Mayor decided that Mr. Hartley should be fined 200*l.* on the second charge, and forfeit the tobacco. A similar charge was brought against Mr. Alfred Hamer, successor to Mr. Hartley, and having been proved, he was fined in the mitigated penalty of 50*l.*

Portsmouth.—Two Courts-Martial were held in this port last week. The first was on Mr. G. M. Smith, acting mate on board Her Majesty's brig Pantaloon, Commander Lapidge, on a number of charges. The Court having heard the whole of the evidence and the defence, was of opinion that the charges had not been proved except that Mr. G. Smith had been guilty of having improperly made use of the name of his commander, Lieut. Lapidge, in the gun-room of the brig, and admonished Mr. Smith to avoid in future the line of conduct so calculated to subvert the discipline of Her Majesty's service. The second Court-Martial was on Lieut. Lapidge, commander of the above ship, on charges respecting the bad discipline on board his ship, while stationed on the coast of Africa. The principal witness in this case was the mate who had been tried previously. The Court considered the charges partially proved, but considering the services and good character of Lieut. Lapidge, they adjudged him to be severely reprimanded.

Stourbridge.—On Wednesday week a fatal accident happened on the brewery of Messrs. Hipkiss and Green, wholesale brewers, near Oldswinford Church. The premises contained a powerful engine, used for drawing water for brewing, grinding malt, &c., the boiler of which, from some cause at present unknown, burst, and destroyed everything around it. The building was entirely cleared to the ground—the boiler itself rushing across the road to a house opposite, which it beat in and unroofed, remaining before the ruins an extensive flattened mass, and but for the rivets which remained, more like a flat plate of iron than the arched roof of a boiler. To the left of the boiler-house another small house was laid in ruins, and all within the reach of the destroying power was razed to the ground. As soon as possible after the explosion search was made for those who were known to have been in or near the premises. Mr. Green was first discovered suffering from scalds and contusions; two of the workmen and a child were found dead, and others were seriously injured.

Sunderland.—The pitmen's strike has brought trade almost to a stand-still in Sunderland, the only coal now shipped being of a quality that would not have found a market in times of ordinary trade. One effect of the strike is, that ships are going down into Scotland from the Tyne and the Wear, to seek cargoes of Scotch coal for the use of the metropolis, thereby giving it an introduction and perhaps a permanent standing, in the most important market of the trade.

York.—The churchwardens of the different parishes in York are at present actively engaged in going from house to house soliciting subscriptions for a clock bell, to weigh no less than eight tons, to be placed in the north-west tower of the Cathedral; and there is every reason to believe that their exertions will be successful.

Railways.—The following are the returns for the past week:—Birmingham and Derby, 1360*l.*; Birmingham and Gloucester, 2143*l.*; Eastern Counties, 4474*l.*; Edinburgh and Glasgow, 2091*l.*; Great Western, 15,868*l.*; Grand Junction, 8295*l.*; Glasgow, Paisley, and Ayr, 1180*l.*; Great North of England, 1525*l.*; London and Birmingham, 19,095*l.*; South-Western, 5891*l.*; Blackwall, 875*l.*; Greenwich, 851*l.*; Brighton, 3763*l.*; Croydon, 287*l.*; Liverpool and Manchester, 4141*l.*; Manchester, Leeds, and Hull, associated, 6369*l.*; Midland Counties, 2902*l.*; Manchester and Birmingham, 3345*l.*; North Midland, 4545*l.*; Newcastle and Carlisle, 1356*l.*; South-Eastern and Dover, 3587*l.*; Sheffield and Manchester, 522*l.*; York and North Midland, 1638*l.*—A special meeting of the Eastern Counties Company was held on Tuesday, when resolutions were agreed to for the purpose of raising 960,000*l.*, in order to extend the line from the Ely and Peterborough line to Lincoln. The directors stated that they had deemed it right to advise the extension of the Hertford branch to Hitchin for fourteen miles, for which they had ordered a survey, also in continuation from Hitchin to Bedford, after which the proprietors would be called together.—On Wednesday, the opening of the Bristol and Exeter Railway to the terminus at Exeter was celebrated with the usual honours. All business was suspended in that city, thousands flocked in from the country, and the streets, paraded by bands of music, were densely thronged with people in holiday attire. By the opening of this line there is now an uninterrupted communication westward from London of 194 miles, 118 of which belong to the Great Western Company, the remaining 76 miles being the length of the Bristol and Exeter line.—The Bricklayers' Arms station of the Croydon, Brighton, and Dover Railways was opened on Wednesday, and will doubtless prove very convenient to travellers going to the West End of London.

IRELAND.

THE STATE TRIALS.—As announced briefly in our last, the motion on the part of the traversers for a new trial, was opened on Thursday by Mr. Whiteside, who occupied the whole of that day and Friday with his arguments. The address of the learned gentleman was more distinguished for legal acuteness than for eloquence or public interest. The first ground of his objection was, that there was no such person on the jury as John Rigby, the gentleman who impersonated him being John Jason Rigby, who was neither on the panel or summoned to attend. He cited a considerable number of cases, to convince the Court that but 11 jurors actually tried the late issue. His next had reference to the "abstraction" of the names from the jury list; then to the Judge's charge—next, to the evidence which was admitted for the prosecution. The learned gentleman argued at great length, that the violent ballad sold at Mullaghmast should not have been received in evidence; and that the newspaper evidence should have been rejected on the ground that there was no proof to affect any of the traversers by newspaper publications, except the registered proprietors of those journals. He concluded by quoting a series of passages from the Lord Chief Justice's charge, which he contended were his directions, inasmuch as the Judge gave his own opinion as to the guilt or innocence of the traversers, and touched upon questions which, properly speaking, came within the province of the Jury. On Saturday, Mr. Moore, Q. C., followed on the same side as counsel for the Rev. Thomas Tierney. He said it was necessary for the Crown to establish the affirmative of two propositions; first, that on, or previous to, the 23d of October, 1843, there was an already-formed conspiracy, and then that Mr. Tierney had joined in it; but if either of those propositions failed, he ought not to have been convicted, and the verdict ought to be set aside. The Learned Counsel then proceeded to urge that the evidence affecting Mr. Tierney failed to establish those points, and that there was no evidence to show that he was aware of any of the meetings attended by the other traversers, or heard of or read their speeches, or publications; that there was nothing to connect him with the conspiracy antecedent to the 23d of October, 1843. He contended that the evidence against Mr. Tierney was not sufficient to warrant his conviction, and that the evidence had not been submitted by the Learned Chief Justice to the Jury in such a way as it ought to have been, and that he therefore was entitled to a new trial. Mr. O'Hagan then followed on behalf of Mr. Duffy, contending that there was no legal proof against Mr. Duffy, of the proprietorship of the *Nation* newspaper, and that the conductors of public journals cannot be made responsible for the acts of the leading members of the party whose opinions they advocate. At the close of his speech the Solicitor-General rose on the part of the Crown to oppose the motion for a new trial, and commenced by replying to the arguments on the wrong entry of the name of Mr. Rigby. The Court adjourned after he had been speaking about an hour. On Monday the Solicitor-General resumed his address, and replied to the arguments on the omission of certain names from the Jury List, contending that all that had been said in support of obtaining a new trial on that ground, was mere repetition of the arguments put forward on the motion to quash the panel. He defended the charge of the Chief Justice, and said that it was listened to from beginning to end by the counsel for the eight traversers, without one single objection or observation being made. He then referred to the argument, that although the statutable proof is sufficient against the proprietor of the paper, it is not sufficient evidence as regards third parties. On this point Mr. Justice Burton appeared to think that the question had not been met. The Solicitor-General, therefore, read the section of the statute of 6 and 7 William IV., chap. 76, on the subject, and relied on the objection not having been made at the trial, that the evidence of publication was not sufficient against those traversers who were not proprietors of the papers, as precluding them from now objecting to it, and he would say it was (he meant in contemplation of law), a fraud to let evidence pass by without objection, and then, after a verdict was got against the party, for him to come forward and object to its having been admitted; it was an unfair mode of proceeding. In regard to the objection that the Jury were allowed to disperse the case of King *v.* Kinnear in 2 B. & Al., 462, cited by Mr. Whiteside, from 1 Chitty, showed that it was lawfully done, and the consent of the party ought not to be asked. The Solicitor read the short-hand writer's notes in reference to the point, to show that the traversers' Counsel had assented to the Jury separating, and it was now too much to call on the Court to grant a new trial on this ground. At this time 4 o'clock had arrived, and the Court adjourned. The Solicitor-General on Tuesday brought his speech to a close, when Mr. Henn commenced his address in reply on behalf of Mr. Steele. He adverted generally to the same points as had been argued by the previous counsel on the same side, dwelling particularly on the charge of the Chief Justice. On Wednesday Mr. Monahan, Q.C., followed on behalf of Mr. John O'Connell, and directed his arguments chiefly to the jury-lists. At the close of his speech the Court adjourned, and on Thursday Mr. Fitzgibbon opened his address on behalf of Dr. Gray. It is arranged that Mr. M'Donagh will follow on the same side, and the Attorney-General will then reply on the whole case.

Dublin.—The weekly meeting of the Repeal Association took place on Monday. Mr. D. O'Connell, Jun., took the chair. Mr. S. O'Brien then moved the adoption of a petition against the renewal of the Bank of Ireland charter. The motion was seconded by Mr. J. Reynolds, who went at considerable length into the state of banking in Ireland, and detailed the injuries that would inevitably result to this country from the contemplated withdrawal of small notes from circulation. Mr. O'Connell moved that the Association at its rising do adjourn to Friday next. He would on that day bring forward his plan for carrying on the agitation after the termination of the state trials. He then proceeded to inculcate the principles of peace and tranquillity, and perseverance, and said that nothing could so much dishearten him and injure their cause as any outbreak or disturbance. The rent for the week was 191*l.* 13*s.* 3*d.*

Limerick.—Part of the stables of the Earl of Dunraven, in the demesne of Adare, were maliciously burned on Thursday week, but it is believed that a satisfactory clue has been obtained to the authors of the mischief. A man named Regan, a Government witness, or informer, is believed to have done it for the purpose of charging others with the crime, and to have been assisted by two females. All the parties were taken into custody. On searching Regan's person some flints were found, two lucifer matches, and the names of ten persons on paper, presumed to be the victims of a false information, as the real incendiaries. On the same night two panes of glass were broken in Adare church, and a train of powder was found, extending from the communion table to Lord Dunraven's pew! The stones which broke the windows were found in the church, and the train was to have been secretly ignited on Saturday night. A blunderbuss was also found in the garden of a man who was to have been denounced as an accomplice in this plot. One of the female prisoners, it is understood, has divulged great part of the ingredients of this conspiracy.

Miscellaneous.

Colonel Stoddart and Captain Conolly. — We take the following article from the Agra *Ukhbar*, received by the Overland Mail this week. The news of Colonel Stoddart and Captain Conolly being alive is given with great positiveness:—"We have just, at a late hour, received a piece of intelligence, which we lay before our readers without note or comment. Our Lahore correspondent mentions to us, as a fact on which every reliance can be placed, that Dost Mahomed had sent intelligence to Colonel Richmond, that both Colonel Stoddart and Captain Conolly are alive. There can therefore be no doubt that the Rev. Mr. Wolff will be successful in attaining one object of his journey, viz., in finding them alive; what may be result of his mission remains to be seen.—March 11."

Royal Palaces, Gardens, &c.—A Parliamentary return has been published of the sums received by the Commissioners of Woods, Forests, &c., on account of the Royal palaces, gardens, parks, &c, from the years 1838 to 1842, both inclusive. The following are the results. In 1842-43, the sums received were as follows:—viz., from Hyde, St. James's, and the Green-parks, 1089*l.*; from Kensington-gardens, 70*l.*; Regent's-park, 996*l.*; Greenwich-park, 6*l.*; Kew-gardens, 1118*l.*; Old Deer-park at Kew, 1170*l.*; Richmond-park, 726*l.*; Hampton-court and Bushey-parks, *nil.*; Windsor Great-park, 5330*l.*; New Royal Kitchen-gardens at Frogmore, 73*l.*; the Phœnix-park in Dublin, 1720*l.*; and the sum of 2000*l.*, being a portion of the purchase-money received from Prince Albert, for the stock of the Norfolk and Flemish farms (purchased on behalf of the Crown in 1837, of the executors of King William IV., being part of His late Majesty's private property.) Thus, the total amount received was about 14,298*l.* The account in detail shows this revenue to arise principally from the sale of decayed timber, loppings of trees, &c., the sale of hay, bark, stock, garden produce, and old materials; the rent of grass-lands, chairs, and free-board rents; subscriptions for keys of the pleasure-grounds, &c. The sum of 1170*l.* is paid by the King of Hanover for the rent of the Old Deer-park and Kew; and the sum of 800*l.* is annually allowed from the Lord Steward's department towards the expenses of the Botanical-garden at Kew.

Mozart.—A Vienna journal mentions that the celebrated singer, Madame Hasselt Barth, has recently erected, at her own expense, a monument over the grave of Mozart. On a tablet of gray marble are inscribed, in letters of gold, the words "Jung, gross, spat erkannt, nie erreicht." (Young, great, late acknowledged, never equalled.) This inscription, briefly characterising the talent of Mozart, is surmounted by a medallion head of the great composer. It is also mentioned that the hitherto unauthenticated dates of Mozart's death and burial are now verified beyond doubt. The uncertainty which prevailed respecting the place of his interment is now also removed. His grave was supposed to be in the Matzlemdorfer churchyard; but it is now certain that his ashes repose in the St. Marxer burial-place.

Law.

HOUSE OF LORDS—APPEALS.—*Lord Blantyre* v. *The Earl of Wemyss and Captain Keith.*—This was an appeal from a decree of the Court of Session, on the subject of the tithes of the parish of Haddington. A decree of augmentation of stipends was obtained by the ministers of that parish from the Lords of Council and Session, as commissioners appointed for the plantation of kirks and valuations of lands, in each of the years 1797, 1807, and 1826. A computation and settlement of the tithes, called in Scotland a process of locality, was made, which did not include the lands of the respondents, and as this threw a greater burden on the appellant, he instituted proceedings to determine the relative liabilities of the landowners of the parish. The respondents did not produce any charter of exemption from a churchman, by which their lands were released from tithes, but relied on a former process of locality made in the year 1810, by which the settlement of the locality being declared according to the titles of the landowners, the lands they held appeared to be exempted. The appellant insisted that in order to exempt a heritor from liability to stipend, he must produce a charter or other exemption from a churchman, dated prior to the Act of Annexation of 1587, and that this charter must contain not only the words *cum decimis inclusis*, but also the words *et nunquam antea separatis*. As the respondents could not produce any charter of this kind, the appellant contended that the interim scheme of locality could not be received as a final adjudication of the matter. The case, after various interesting proceedings, came before Lord Cunninghame, as Lord Ordinary, and his Lordship pronounced a decree, finding "that the record of the former process affords clear evidence that the judgment pronounced in said process, exempting the lands of the present respondents from the allocation, as held *cum decimis inclusis*, was neither pronounced in absence, nor *per incuriam*, but on a deliberate discussion and consideration of the law, as then understood." He therefore treated the matter as *res judicata*, and found in favour of the respondents. This finding was affirmed in the Inner House. Mr. Kelly and Mr. G. Bell appeared for the appellant, and the Lord Advocate and Mr. Anderson for the respondents. The Lord Chancellor, at the close of the arguments, expressed his opinion that the process in 1710 had not decided the right now in question, and that the present suit was therefore maintainable, as the matter was not *res judicata*, since it had not necessarily been the subject of decision in the former suit. Lords Brougham, Cottenham, and Campbell concurred; and the judgment of the Court below was therefore reversed, and the cause remitted.

CENTRAL CRIMINAL COURT.—*The Will Forgeries.*—As a sequel to the late trials, the following curious history of the discovery of these frauds, and the gradual development of the facts connected with them may interest our readers. The forgery of the will of Miss Slack, it will be remembered, was that which was first discovered. It appears that when a will or other evidence of death is left at any of the offices of the Bank, the course regularly pursued is, to send information of the fact to the other offices of that establishment. Accordingly when the forged will of Miss Slack was left at the Bank for the purpose of claiming that portion of her stock which had been transferred to the commissioners for the reduction of the National Debt, notice of her death was forwarded to the office of the Reduced Three-and-a-Half per Cents., of which description of stock Miss Slack had, it appears, also a sum standing in her name. Under this will the stock transferred to the commissioners was, as is well known, appropriated by the fictitious Emma Slack. Matters remained in this condition for some months, until a broker was instructed to purchase a sum of Three-and-a-Half per Cents. stock into the name of the rightful Miss Slack. The gentleman, when he proceeded to fulfil his instructions, was told by the officials of the Bank that Miss Slack was dead, and that it was against the rules of the Bank to allow any stock to be purchased into the name of a deceased person. He was surprised upon receiving such a communication; and, by way of solving the mystery, he wrote to the young lady herself, informing her of her reported death. If the broker was surprised, it can be easily imagined that the lady felt and expressed as much astonishment; and in order to set a matter of such painful importance at rest, she as soon as possible presented herself at the Bank, where the subject was fully investigated; and all parties interested in the proper disposal of the property concurred in the belief that a fraud had been committed. The first thing which suggested itself to those engaged in the investigation was to ascertain who the solicitor employed on the occasion of the transfer was, and in this stage of the inquiry the name of Mr. Barber was brought to notice. Mr. Barber was seen; but he failed to give any satisfactory account of the transaction. Investigations were persevered in, and at length Barber was taken into custody by Daniel Forrester. Upon Barber's apprehension, his diary, it appears, was secured—a document which immediately made the authorities at the bank acquainted with the name of Joshua Fletcher. The possession of Barber's diary was doubtless of considerable service to the prosecutors in the examination which took place before the Lord Mayor upon Barber's apprehension, on which occasion Barber called Fletcher as his witness, after the cross-examination of whom by Mr. Clarkson, for the Government, both witness and accused were remanded for further investigation, and ordered to be kept apart from each other. Neither one nor the other however would tell who the Emma Slack was who had administered to the will further than that she was a lady of most unexceptionable respectability. The next step to be taken, therefore, was to find out who Emma Slack was, and that point was long involved in a mystery apparently impenetrable. All that could be ascertained for a considerable period was that she had resided in a house in town for a few weeks; but from what place she had come, or to what place she had gone, no one could surmise. In the mean time Barber and Fletcher were on various occasions brought before the Lord Mayor, and their counsel and attorneys exercised all their skill to excite the public sympathy in favour of the prisoners, and to obtain as quick a trial as possible for them. The Bank, judging that the Slack case was not the only case in which Mr. Barber had been engaged of a similar description, caused a rigid search to be made relative to other transactions with which Barber was mixed up as the attorney. This inquiry brought to light, first, the case of Hunt, then the case of Burchard, and ultimately the case of Stewart. All of these were subjected to a course of examination, and on each of the four first occasions in which Barber and Fletcher were brought up for examination, a new and additional charge was alleged against them. In the mean time it was not at all known who were the other parties that had been confederates with Barber and Fletcher to effect these frauds. With the view of breaking into the cases, a reward of 100*l.* was offered to any party who should discover who Emma Slack was; but the offer was unsuccessful. Ultimately, however, the attention of the prosecutors was directed to a Miss Richards, who, it was stated, came from Bath, and was intimately acquainted with Fletcher and his first wife, and whose description exactly corresponded with that of a person who had visited Emma Slack during her stay at her lodgings near Tottenham-court-road. Miss Richards was accordingly traced from place to place, until it was ascertained that she had married a shopkeeper, named Dorey, and that she resided in Oxford-street. Here she was identified as a visitor of Emma Slack, and apprehended, and some of her writing was obtained, and in her trunk the seal was found which bore the same device as that attached to the will of Eliza Burchard. This was a very important step for the prosecutors; for the seal showed that she was cognisant of the will of Eliza Burchard, and her handwriting resembled that in which the will of Mary Hunt was written. Still the precise part taken by her remained to be proved, and the presence of Emma Slack appeared to be indispensable to a clear development of the plot. The description of the person, manners, and habits of Emma Slack was closely inquired into, and upon comparison with the account given of the persons, manners, and habits of Mrs. Dorey's relations, was found precisely to correspond with what was said of Lydia Sanders, her sister, the wife of William Sanders, fishmonger, of Bristol. Visits were, from time to time, paid to Bristol by John and Daniel Forrester; but neither she nor her husband could be found, and their absence naturally tended to strengthen the suspicion which existed against them. As the investigations were carried on, it was found that not only did the description of Mrs. Sanders agree with that given of Emma Slack, but that the description of William Sanders also corresponded with that of Thomas Hunt, the alleged executor of Mary Hunt. The prosecutors obtained information from no one that these were actually the parties engaged in the transactions; but so accurate were the descriptions obtained and so confirmed were they by dates and other circumstances, that the prosecutors offered a reward of 100*l.* for the discovery of Lydia Sanders, and a further sum of 100*l.* for the discovery of her husband. The offer of these rewards was for some time of no avail; but, ultimately, through some channel which has not been made known, Sanders and his wife were found living in an obscure part of Edinburgh, under an assumed name, and were there apprehended. The determination of the prosecutors to apprehend Mr. and Mrs. Sanders was fully justified by the result; for these participators in the delinquencies of Barber and Fletcher were immediately identified as the individuals who had personated the two fictitious parties alluded to. Mrs. Dorey was also identified as Eliza Burchard, the fictitious niece and executrix of the testatrix Eliza Burchard. It still, however, remained to be discovered who Elizabeth Stewart, the assumed sister and administratrix of John Stewart, was. This question was involved in more than ordinary obscurity and confusion, as no person living could be found who answered the description of the performer of that part. The servant who attended on the aged female Elizabeth Stewart, was, however, as it appears, traced out, and the most accurate information was obtained respecting the infirm mistress, and, after a lengthened investigation, Elizabeth Stewart was satisfactorily proved to be no other than Mrs. Dorey's and Mrs. Sanders's mother, who shortly afterwards died, and whom Mrs. Dorey visited in the pretended relationship of niece. This servant gave such an account of the fictitious Elizabeth Stewart, that the portrait was considered perfect, and those who knew the mother of Mrs. Dorey declared it to be quite impossible that the lady who played the character could have been any other. Indeed, such was the truth of the description, that Mrs. Dorey, upon hearing it, burst into tears, and became an object of great commiseration. The gown, or rather the remnant of the gown, of Mrs. Richards was, notwithstanding the lapse of three years since her death, searched for and found in the hands of a charwoman, to whom it had been given by Mrs. Dorey upon the decease of her mother, and that gown was immediately identified by the attendant upon the old woman. The mother of Mrs. Dorey and Mrs. Sanders was the daughter of an aged soldier of the name of Crene, a pensioner of the Government at Falmouth, and their father (Wm. Richards) was the steward of a Lisbon Government packet. On the proclamation of peace, Mr. Richards went to Lisbon, to establish himself there, but he soon afterwards died in embarrassed circumstances in that city. The daughters had been brought up as milliners; but, on their father's death, the mother and daughters opened a china-shop at Falmouth, where they remained a few years, when they removed to Biddesham, in Somersetshire, and at last to New Bond-street, Bath, where they carried on the business of straw-bonnet-makers. In this street Sanders kept a fish-shop, and thus, from the circumstance of neighbourhood, became acquainted with Lydia, who played the part of Emma Slack, and it is believed led the unfortunate man, with the aid of her sister, into all the mischief and misery, to the details of which the public have been so long accustomed. Here also Mrs. Dorey, then Georgiana Richards, became acquainted with Carlile, on one of his visits to that city; and to this cause, and to the blasphemous doctrines of Carlile, the whole of the family ascribe their ruin.—A report has been current for some days that all the prisoners who were tried with Barber had declared that he was innocent. On Wednesday, however, the Governor of Newgate waited upon the Lord Mayor to deny the rumour, and to state that Barber had asked the other prisoners to sign a declaration of his innocence; and that they had all refused to do, with the exception of Mrs. Sanders.

SPORTING.

NEWMARKET FIRST SPRING MEETING.

FRIDAY.—The races concluded this day, with *The Newmarket Stakes*, of 50 sovs each, h ft; for three-yrs-old colts, 8 st 7 lbs; and fillies, 8 st 2 lbs. D.M. 10 subs. Duke of Rutland's c by Beiram, out of Tragedy, beat Lord Exeter's Crosby, by Liverpool; Duke of Bedford's c by Liverpool, out of Princess Victoria; Lord Exeter's Economy; Mr. Payne's Vattel; Lord Albemarle's Candidate; Mr. Batson's Anniversary; and Mr. Coombes's Keeley.—*Match*; 200, h ft. T.Y.C. Duke of Bedford's Oakley, 8 st 7 lbs, beat Lord Exeter's Celia, 8 st 7 lbs, by half a length cleverly. This was their fourth match, each having won two; it is not at all improbable that they will again be pitted against each other in October.—*Match*; D.M. 200, h ft. Lord Chesterfield's Tiddly Winks, 8 st 2 lbs, received from Lord Glasgow's c by Velocipede, 8 st 7 lbs.

BIRTHS.—On the 5th of February last, at Birdwan, East Indies, the lady of Major WM. RIDDELL, of the Bengal Army, of a son—14th ult., at Brighton, the wife of F. O. WELLS, Esq., Bengal Civil Service, of a daughter—27th ult., at 12, Lower Berkeley-street, Portman-square, the lady of J. LAURIE, Esq., M.D., of a son—27th ult., at Banham, Norfolk, the lady of N. SURTEES, Esq., of a son—28th ult., at Regent-place, the lady of W. M. ARMSTRONG, Esq., of twin daughters—28th ult., at St. Leonard's, LADY HADDO, of a daughter—29th ult., in Porchester-place, the lady of V. B. CORBIE, Esq., of a son—29th ult., at Cross-deep, Twickenham, the lady of G. BARNARD, Esq., of a daughter—29th ult., in Hanover-street, Hanover-square, the lady of DR. RUTTLEDGE, of a son—30th ult., in Hart-street, Bloomsbury-square, prematurely, Mrs. R. B. SANDERS, of a daughter, still-born—30th ult., at 20, York-terrace, Camberwell New-road, Mrs. H. A. BEVAN, of a daughter—1st inst., at High Elms, LADY LUBBOCK, of a son.

MARRIED.—On the 23d ult., at Whirwell, Sir W. EDEN, Bart., to ELFRIDA S. IREMONGER, youngest daughter of Col. Iremonger, Wherwell-priory, Hants—Lately, at the British Embassy, Paris, Lady AUGUSTA FITZCLARENCE, daughter of the late Earl of Munster, to the Swedish Count PHILIP DE BONDE—25th ult., at Clevedon Church, T. O. TYNDALL, Esq., of the Fort, Bristol, to CAROLINE LUCY ELTON, daughter of Sir C. A. Elton, Bart., of Clevedon Court, Somerset—25th ult., at St. Cuthbert's, Wells, the Rev. C. WARD, rector of Maulden, Bedfordshire, to ELIZ. MELLIAR, only child of the Rev. A. Foster, vicar of Kingston, Somerset, and widow of the late A. F. Melliar, Esq., of Wells—26th ult., at St. Mary's, Bryanston-square, A. BOYD, Esq., eldest son of J. Boyd, Esq., of Broadmeadows, Selkirkshire, to ELIZ. H. DUDDINGSTONE, eldest daughter of the late Rear-Admiral Duddingstone, of Earlsferry-house, Fifeshire—30th ult., at St. George's, Hanover-square, M. SAURIN, Esq., youngest son of the late Lord Bishop of Dromore, to MARGARETTA S. JONES, eldest daughter of the late Rev. J. Jones, of Penlan, in the county of Cardigan, and niece and heiress of the late M. Jones, Esq., of Kilwendeage, Pembrokeshire—30th ult., at St. George's, Hanover-square, A. WAY, Esq., son of the late Rev. L. Way, of Stansted-park, Sussex, to the Hon. EMMELINE STANLEY, daughter of Lord Stanley, of Alderney.

DIED.—Recently, at his seat, in Sussex, SIR TIMOTHY SHELLEY, Bart. He was son of the first Baronet. His grandson, Mr. P. Florence Shelley, inherits the family honours, being the son of Mr. Percy Bysshe Shelley, the celebrated poet, and Mary Wolstonecroft, the authoress of "Frankenstein," who was daughter of William Godwin, the celebrated author of "Caleb Williams."—16th ult., at Preston Deanery, Northamptonshire, ROBT. CHRISTIE, youngest son of Langham Christie, Esq., aged 10—16th ult., WM. SMITH, of Norolton, aged 74—18th ult., at his residence, Camden Villas, BENJ. HOPKINSON, Esq., solicitor, late of Red Lion square, after a protracted illness, aged 51—18th inst., in Guernsey, N. T. E. HEATHCOTE, Esq., second son of R. E. Heathcote, Esq., of Longton-hall, Staffordshire, and of Emma Sophia, daughter of the late Sir Nigel Bowyer Gresley, Bart., of Drakenlow, Derbyshire—19th ult., at Blackheath, the Hon. HY. LEGGE, aged 80—19th ult., at his residence, in Sloane-street, BENJ. OAKLEY, Esq., formerly of Beckenham, Kent, universally esteemed and respected, aged 78—At Mannheim, on the Rhine, ELIZ. GRAHAM, wife of the Rev. H. Elliot Graham—24th ult., at Boyland-hall, Norfolk, Rear-Admiral the Hon. F. P. IRBY, aged 66—27th ult., S. BRAND, Esq., of Red Cross-street, surgeon to the City Police Force, aged 43—27th ult., at her house in Green-street, LADY G. MURRAY, aged 79—27th ult., at his residence, Brunswick-place, City-road, the Rev. H. MOORE, the confidential friend and biographer of the late Rev. John Wesley, aged 93—29th ult., at Abbott's Leigh, near Bristol, from the effects of severe injuries received by being thrown out of a pony-carriage, FRANCES E. WOLLEY, relict of Vice-Admiral T. L. Wolley, of Clifton, aged 72—29th ult., at the residence of her father, Sir R. F. Russell, Bart., in Cavendish-square, the Right Hon. AUGUSTA LOUISA LADY WALSINGHAM, wife of the Right Hon. Thomas Lord Walsingham—30th ult., at Wilton-place, of fever, the Hon. CAROLINE G. DE MONTMORENCY, the dear and beloved child of the Viscountess Frankfort—On Thursday morning, at Welbeck Abbey, found dead in her bed, Her Grace the DUCHESS of PORTLAND.

FELIX SUMMERLY'S HOME TREASURY OF BOOKS, PICTURES, TOYS, &c.; purposed to cultivate the Affections, Fancy, Imagination, and Taste of Children.

Toys just Published:

BOX OF 10 BEST COLOURS FOR LITTLE PAINTERS, with Hints and Specimens. 6*s.* 6*d.*

TESSELATED PASTIME, with numerous Patterns. 6*s.* and above.

Books just Published:

JACK AND THE BEAN-STALK A New Edition, with 4 NEw Pictures. 3*s.* 6*d.* and 2*s.*

THE PLEASANT HISTORY OF REYNARD THE FOX, told by Everdingen's 40 Pictures. 6*s.* 6*d.*

BIBLE EVENTS, with 8 Pictures by Holbein. 4*s.* 6*d.* and 2*s.* 6*d.*

LITTLE RED RIDING HOOD, with 4 new Pictures. 3*s.* 6*d.* and 2*s.*

BALLADS OF CHEVY CHASE, with 4 New Pictures. 4*s.* 6*d.* and 2*s.*

BEAUTY AND THE BEAST, with 4 New Pictures. 3*s.* 6*d.* and 2*s.*

TRADITIONAL NURSERY SONGS, with 8 New Pictures. 4*s.* 6*d.* and 2*s.* 6*d.*

SIR HORNBOOK; an Allegorical Ballad, with 8 Pictures. 4*s.* 6*d.* and 2*s.* 6*d.*

The *Athenæum* recommends them as a Bouquet of Flowers "immortals" as the Florists would call them; for they are not subject to change, and will be fresh and fragrant at Christmas, or on New Year's Day, or at Easter, or on any other or all holiday seasons.

In preparation:

PORTFOLIO OF PICTURES, Ancient and Modern, Coloured and Plain, for Copies, 7*s.* 6*d.*

BOX OF TERRA COTTA BRICKS, Geometrically made, 10*s.* 6*d.* and upwards.

Published by JOSEPH CUNDALL, 12, Old Bond-street, London.

A SINGLE BOTTLE OF BETTS'S PATENT BRANDY may now be obtained in a perfectly genuine state. This convenient arrangement for both vendor and purchaser, and their mutual security against deception, is effected by the use of BETTS'S PATENT METALLIC CAPSULE, made of pure and SOLID METAL, (not Tin Foil) which completely encloses the cork and mouth of the bottle, and is embossed with the words "BETTS'S PATENT BRANDY, 7, SMITHFIELD BARS," the *fac-simile* of which is engraved on a label affixed to each bottle.

In the present day it is impossible to produce anything new and useful without exciting the cupidity of imitators. Already attempts are made to mystify the identity of the original and genuine article, by foisting upon the public the contents of bottles having a Tin Foil covering, falsely denominated "a neat metallic capsule." J. T. BETTS & Co. therefore deem it essential to impress upon purchasers the absolute necessity of comparing the embossed Capsules with the Labels, as an infallible mode of detecting fraudulent substitutions.

BETTS'S PATENT BRANDY, thus protected, may be obtained of the undermentioned Wine and Spirit Merchants, at 3*s.* 6*d.* per Bottle, Bottles included; or at 18*s.* per Gallon, as heretofore, at

Bishopsgate Street	W. Stevens, Nos. 78 and 80.
Bayswater	Charles Simpson, 22, Bayswater Terrace.
Blackfriars Road	S. Silcock, No. 1.
Brixton	S. Hawks, Brixton Washway.
Camden Town	George Roberts, 91, High Street.

Whitechapel	Wm. Coats, 25, High Street.
Walworth	G. Potter, 10, Beckford Row.
Walworth Road	Wm. Garrett, 14, Bolingbroke Row.
Westminster	John Jones, 3, Rochester Row.
Ditto	James Watson, 7, Great Chapel Street.
Westminster Road	Robert Shaw, 10, Gilbert Buildings.

CAUTION.—MECHI'S MAGIC STROP.—"The real Magic Strop," "The Double Magic Strop," "The Magic Strop," are all base imitations of Mechi's Magic Strop. None are genuine without Mechi's name, which they dare not use; yet, strange to say, many perfumers, calling themselves respectable, endeavour to palm this rubbish (they cost from 3*d.* to 5*d.* each in Sheffield) on the public as Mechi's genuine Strop, although they possess no sharpening properties whatever, but the very reverse. The well-known Magic Paste is an invaluable auxiliary to Mechi's Strop; its renovating properties are astonishing. Mechi's Razors stand pre-eminent.

RAMS FOR RAISING WATER WITHOUT LABOUR, WHERE A FALL CAN BE OBTAINED,

FOUNTAINS of every description. Specimens of the Fountain to be seen at the above address.

WATER RAM.

Also a Ram fixed on the premises. F. ROE, 70, Strand, London.

Every kind of Garden and other Pumps, Well Engines, &c.

TO LADIES.

ROWLAND'S KALYDOR.—This Royally Patronised and universally adopted Specific is a balmy, odoriferous, creamy Liquid, composed chiefly of extracts from the most rare Flowers and Herbs of an Eastern Clime. Its discovery was no less singular (by a Lady of rank), than its effects have been felicitous, during the last thirty years. It is the mildest and most efficacious preparation ever known for dissipating Tan, Pimples, Freckles, Discolorations, and other Disfigurements of the Skin. The radiant bloom it imparts to the Cheek, and the softness and delicacy it induces on the Hands, Arms, and Neck, render it indispensable to every Toilet.

Gentlemen will find it peculiarly grateful after shaving, in allaying irritation of the skin, and in rendering it soft and smooth.

Price 4*s.* 6*d.* and 8*s.* 6*d.* per Bottle, duty included.

CAUTION.—The great demand for this article excites the cupidity of *unprincipled Shopkeepers*, who vend the most *spurious trash* as the "GENUINE KALYDOR:"—whereas the genuine article is prepared solely by A. ROWLAND and SON, and the amalgamation of its *costly exotic* materials renders abortive any attempt to discover its component parts—thus proving the imposition of all other articles bearing the title of "KALYDOR." The genuine article has the words "ROWLAND'S KALYDOR" on the Wrapper.

*** All others are FRAUDULENT COUNTERFEITS!!!

BURBIDGE AND HEALY'S COOKING APPARATUS, combining Sylvester's Patents.—This Cooking Apparatus is believed to possess greater general advantages than any yet submitted to the Public, both as regards strength of material and workmanship; in fact, the laws of heat are so applied as to produce the greatest effect with the least consumption of fuel, without destruction to the Apparatus; and B. and H. can safely recommend it from experience, as unquestionably superior to anything of the kind hitherto made. A Prospectus can be forwarded, upon application, detailing particulars and prices, to 130, Fleet-street.

METCALFE'S NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most effectual and extraordinary manner, and is famous for the hairs not coming loose—1*s.* An improved Clothes Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh Brushes, of improved graduated and powerful friction. Velvet Brushes, which act in the most surprising and successful manner. The Genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE'S Sole Establishment, 130B, Oxford-street, one door from Holles-street.

Caution—Beware of the words "From Metcalfe's," adopted by some houses.

DRESS AND FROCK COATS.

DRESS COATS, Superfine Cloth, 27*s.*; extra quality, 35*s.* and 40*s.*; Imperial Saxony, 50*s.*; Frock Coats, Silk Facings, 30*s.* to 40*s.*, extra quality, Silk Velvet Collar, and Silk facings, 48*s.*; Saxony ditto, 55*s.*; Children's Silk Tunic and Hussar Suits, 30*s.*; Waistcoats, new patterns, 5*s.* 6*d.* to 10*s.* 6*d.*; Trousers, 6*s.* 6*d.* to 10*s.* 6*d.*; excellent Doeskin, 12*s.* to 16*s.*; Summer Coats, 6*s.* 6*d.* to 10*s.* 6*d.*; Chesterfield Over Coats, with Silk Collars and Cuffs, 15*s.* to 21*s.* The much approved new style, 21*s.* A suit of Black Cloth, 2*l.* 5*s.*; extra quality, 3*l.* 3*s.*; Imperial Saxony Suit, warranted to retain its colour, 4*l.* 4*s.*, at FISHER and Co.'s, Tailors, 31, King William Street, City, 10 doors from London Bridge.

FOREIGN WINES greatly REDUCED in PRICE. for Cash, in quantities of one dozen and upwards, and which, if not approved of, will be exchanged, or the money returned.

Sherry (pale or brown) at	21*s.*	25*s.*	30*s.* 35*s.* and 40*s.*	per doz.
Port from the wood			23*s.* 26*s.* 30*s.* and 34*s.*	ditto.

Messrs. SAVORY and SONS recommend the Prince Albert's Pattern; it is very novel, and of unexampled beauty.

BEE-HIVES.—GEORGE NEIGHBOUR & SON beg to inform their Apiarian friends that they have prepared for the season a large supply of "Nutt's Patent Bee-hives" (for the sale of which they are the only authorised agents), in which are embodied all the recent improvements. Their selection now comprehends most varieties in general use at the present time, including the "Single Box Hive," the "Ladies' Observatory Hive," the "Improved Cottage Hive," with glasses, &c., from either of which the produce may be taken at any time of the gathering season, without destroying the Bees.

G. N. & SON have also Glass Hives, and other articles connected with Bee management, a catalogue of which, with drawings, may be obtained. Letters of inquiry must have postage stamps inclosed.—Apiarian Depot and Honey Warehouse, 127, High Holborn, London.

NUTT ON BEES, Fifth Edition, now Published.

LA POLKA.—The Second Edition of M. JULLIEN'S original POLKA, is just published, with the description by E. COULON, splendidly illustrated by BRANDARD; also the Royal Polka, the Rage of Vienna Polka, Les Folies de Paris, and the Douro Polka, to be had at M. JULLIEN'S Office, 3, Maddox-st., New Bond-st., and of every respectable music-seller in the kingdom. M. JULLIEN and HER KŒNIG are happy to announce that they have already had the honour to introduce this elegant Dance at the Balls of the Haute Noblesse, and that at each soirée it has created the most lively interest and delight. Many spurious imitations of M. JULLIEN'S Polka having been sold to the public under so many assumed forms, he has published the above at his own office, No. 3, Maddox-street; and, in order to secure the public against the possibility of purchasing incorrect copies, he has attached his signature to each. None can be relied on, therefore, which have not his autograph.

THE LATE MR. LOUDON.—The following Subscribers to the WORKS of the late MR. LOUDON have been obtained since making up the List which appeared in the *Gardeners' Chronicle* of April 20.

ARBORETUM BRITANNICUM—10*l.*

Mr. James Cruikshank, Lowther Castle
The Regent's Park Gardeners' Mutual Instruction Society

ENCYCLOPÆDIA OF COTTAGE ARCHITECTURE—63*s.*

Sir Aubrey de Vere, Bt., Currah Chase.

WATERTON'S ESSAYS ON NATURAL HISTORY—8*s.*

Mr. John Fox, Torry Hill, Sittingbourne.

WANTED, by a House in the Wholesale and Retail Seed Trade, a Person having a knowledge of the business, to take the situation of WAREHOUSEMAN AND ASSISTANT in the Shop. The strictest inquiries will be made as to sobriety, honesty, and general conduct. Address, stating references, salary, and full particulars (by letter only), to W. & B., care of Mr. BRISTOW, Seed-merchant, Knightsbridge.

WANTED, a steady, active young Man, who understands the selling of Plants and Trees, and who can look after a horse and cart. He will have to sleep on the premises.—Apply at INGLISH'S Nursery Grounds, Westbourne Green, Paddington.

WANTED, in a Nursery 120 miles from London, where New Holland plants, Ericas, &c. are principally cultivated, a steady, active Man of good character, as PROPAGATOR. It will be useless for any party to apply who is not thoroughly competent in all its branches.—Address letters to A. B., 45, King William-street, London-bridge, London, stating terms, and reference as to character and ability.

TO GARDENERS.

WANTED IMMEDIATELY, by a Gentleman in the Country, a steady, sober, active man, as WORKING GARDENER. He must be a married man, without encumbrance, and have a thorough knowledge of his business, in early Forcing, Pines, Grasses, Peaches, &c., Flower and Kitchen Garden, &c. His wife will be required to undertake the family Washing, and must therefore be a good Laundress. Satisfactory references for character, ability, honesty, &c., will be required.—Direct to A. B., 3, Tenterden-street, Hanover-square, London.

WANT PLACES.—All Letters to be post-paid.

TO NOBLEMEN AND GENTLEMEN.

AS HEAD GARDENER.—A married Man, aged 32, without any incumbrance, who has served the first families in Norfolk, and has a perfect knowledge of gardening in all its branches. Can have a three years' character from the place he is now leaving, where he has had the entire management. No single-handed place accepted.—Direct to A. B., Mr. Fox, Stationer, High-street, Stoke Newington.

AS GARDENER, where one or more men are kept.—A respectable middle-aged Man, who thoroughly understands his business, and is a first-rate Pine-grower; he has been accustomed to Planting and the Management of Woods; can have a 28 years' character from the gentleman whom he lived with last. Wages reasonable. Every information will be given on application to Messrs. W. JACKSON and Co., of the Cross-lanes Nursery, near Bedale, Yorks.

AS GARDENER, where one or more are kept.—A married Man, aged 29, a native of North Britain, who has a thorough knowledge of his business in all its branches. Can produce the most unexceptionable references as to character, ability, &c.—Direct to G. R., 47, Marsham-street, Westminster.

AS HEAD GARDENER.—A married Man, without incumbrance, who has a practical knowledge of his business in all its branches, including Pines, Vines, &c. A good reference can be given. Distance no object.—Direct to E. F., Mr. Peacock, Baker, 1, North-street, Clapham.

AS GARDENER.—A married Man, 28 years of age, who has been in some good establishments in Scotland and England; has a thorough knowledge of his business in all its branches, and can have a three years' good character from his last situation.—Direct to C. H., Bedford Nursery, Hampstead-road.

AS GARDENER.—A single Man from the country, aged 27, who has a general knowledge of his business in all its various branches, and can be well recommended by the gentleman with whom he has lived for nearly five years.—Direct to B. W., Mr. COMRIE'S, 39, North Audley-street.

AS GARDENER.—A single Man, aged 27, who has a practical knowledge of his business, and can give satisfactory references for character and ability.—Direct to WILLIAM MOORE, Caen-Wood, Hampstead, Middlesex.

AS GARDENER, or GARDENER & FORESTER.—T. APPLEBY, late Gardener to T. BROCKLEHURST, Esq., Fence, Macclesfield, with whom he has lived as Gardener and Forester five years, is now at liberty to engage with any Nobleman or Gentleman in want of a first-rate Gardener. He has had long experience in the cultivation of plants, particularly Orchidaceæ; has been successful also in the culture of Pines, Grapes, Peaches, and all other kinds of fruit grown in this country; also has been much employed in the laying out of Pleasure Grounds, Kitchen Gardens, &c., and the management of a Farm and Forest timber. His success in gardening may be inferred from the great number of prizes he has obtained at York, Leeds, Manchester, Liverpool, the London Horticultural Society, and the Royal Botanical Society, Regent's Park. He would also beg to refer to several Essays he has written on various subjects of gardening, which have been from time to time published in the "Gardeners' Magazine," the *Gardeners' Chronicle*, and other periodicals. Wages, 80*l.* per annum, with house and coals. Letters addressed to T. APPLEBY, will meet his best attention.

Royal Botanic Garden, Regent's Park.

AS GARDENER.—A single Man, aged 39, who has lived 10 years in his last situation, where he had an extensive practice in the cultivation of the Pine, Vine, Peach, and Forcing generally; who left in consequence of the decease of his employer, and breaking up of the establishment. Can have the most undeniable reference as to character and abilities.—Direct, pre-paid, to T. M., at Mr. Cuthill's, Florist, Denmark-hill, Camberwell, London.

AS GARDENER, a respectable Single Man, who has served a regular apprenticeship to his business. The Advertiser has a thorough knowledge of the Conservatory, Stove, Early Forcing, Greenhouse, Cultivation of Plants, the Flower and Kitchen Garden, and can be highly recommended by his late master. Direct to C. M., Messrs. HENDERSON'S, Pineapple-place, Edgware-road, London.

AS FARM-BAILIFF.—A Man and his Wife, without incumbrance; the man understands Farming and Stock, and his wife the Dairy and Poultry; they are willing to make themselves useful, and can have good characters from their employers. Direct to M. W., at Mrs. HANCOCK'S, Bedford-road, Clapham, Surrey.

TO LAND-STEWARDS.

AS ASSISTANT.—A Young Gentleman having just finished his education, and desirous of obtaining a thorough knowledge of Farming, would be glad to go for a short time to some Nobleman's or Gentleman's Land-steward.—For particulars, direct to A. W., care of Mr. Henderson, News Agent, Belfast. Scotland would be preferred.

TO LANDED PROPRIETORS.

AN active and experienced Man, who thoroughly understands the management of Woods, Plantations, and Timber, with Measurement, the Repairs of Farm-buildings, &c., offers his services to any Gentleman requiring a person of the above description. He can be well recommended by his last employer for honesty and punctuality in accounts.—Direct to S. S., Post-Office, Corsham, Wilts.

EXHIBITION OF TULIPS.

H. GROOM, Clapham-Rise (late of Walworth), by Appointment Florist to her Majesty, respectfully informs the Nobility, Gentry, and Amateurs, that his superb Collection of TULIPS is now in full bloom, and will continue in perfection until the 21st of May, and can be viewed every day from 9 o'clock until 6, Sundays excepted. Admission, 1*s*.

EXHIBITION OF AMERICAN PLANTS.

H. and J. WATERER beg to acquaint their numerous Patrons, that as they are not able to have their Show in the King's Road this season, the display at the Knap Hill and Bagshot Nurseries is very splendid. The Azaleas are now in high perfection, and may be seen any day except Sunday. Admittance gratis. The Knap Hill Nursery is 2½ miles from the Woking Station, South-Western Railway, from whence conveyances may always be obtained by application to Stephen Moore.—May 12, 1844.

CAMELLIA LOWII, at 5*l*. 5*s*.; GUTHRIANA, at 3*l*. 3*s*.; ALEXINA, at 3*l*. 3*s*., are now ready for delivery. Hugh, Low, and Co.—Clapton Nursey, London, May 9, 1844.

Great Yarmouth Nursery, May 9, 1844.

SUPERIOR NEW SWEDISH TURNIPS.

WARNER AND WARNER, Seedsmen, 28, Cornhill, London, beg to introduce to their Friends the following New Swedish Turnips, which for their general good qualities stand unrivalled; growing to a large size, being small in the top, of a dark yellow flesh, and may be grown as close to each other as a Stone or Stubble Turnip.

WARNER'S RUSSIAN SWEDE . . 2*s*. 6*d*. per lb.
WARNER'S EMPEROR SWEDE . 2*s*. 6*d*. per lb.

Also Warner's Purple-top Yellow Hybrid, 2*s*. 6*d*. per lb., with all the varieties of Norfolk and Tankards, of the most genuine and selected stocks, from 9*d*. to 1*s*. per lb

A GRAND HORTICULTURAL EXHIBITION,

Under the Patronage of His Royal Highness the Duke of Cambridge, K.G., and the Right Rev. the Lord Bishop of Rochester, in aid of the Funds of the GARDENERS' BENEVOLENT INSTITUTION, will be held in the Grounds of the Bishop of Rochester, adjoining the White Hart Hotel, Bromley, Kent, on Tuesday, 11th June next.

LIST OF PRIZES TO BE AWARDED, IF CONSIDERED WORTHY BY THE JUDGES:—

George Charlwood, Esq., of Covent Garden, has kindly offered as a Prize to the Best General Collection of Plants (to be awarded by the Judges) a copy of the late Mr. Loudon's celebrated Botanical Work, the "Arboretum Britannicum," value Ten Guineas.

The above Plants carefully packed and forwarded to any part of the United Kingdom. A post office Order or reference for payment in Town. Persons erecting Greenhouses or Conservatories can be well supplied with the choicest and best of Plants for furnishing, including the many handsome Climbers recently introduced.

N. B.—Plants securely packed for exportation.—Abbey Nursery, Stoke Newington, London.

PANSY, "LADY ALICE PEEL."—In every respect one of the best Show-Flowers of the present year; raised by Youell & Co. in 1843. Blooms were submitted for the opinion of the Editor of the *Gardeners' Chronicle*, a description of which will be found under "Notices to Correspondents," in *Gardeners' Chronicle* of April 27, page 248.

Strong plants are now ready for sending out, post-free, at 3*s.* 6*d.* per plant.—Great Yarmouth Nursery, May 9, 1844.

WILLIAM E. RENDLE can supply the following at the Manufacturers' prices, having been appointed Agent for the sale of them:—

WHITNEY'S TRANSPARENT COMPOSITION, in bottles; quarts, 4*s* 6*d.*; pints, 2*s.* 6*d.*

HUMPHREYS'S COMPOUND, 1*s.* 9*d.* per bottle.

CAMPBELL'S CORN-PRODUCING LIQUIDS.

HENRY HUNT'S PATENT GARDEN-POTS and STANDS, in fancy or common ware.

POTTER'S GUANO.

STEPHENSON'S CONICAL BOILERS.

WILLIAM E. RENDLE'S BOOK-CATALOGUE of GERANIUMS, DAHLIAS, FUCHSIAS, CAMELLIAS, NEW PLANTS, &c., has been just published, and can be had on application.—Union Road Nursery, Plymouth, May 6, 1844.

WARNER AND WARNER, SEEDSMEN, 28, Cornhill, London, beg to inform their Friends they can supply all the new varieties of Fuchsia, Petunia, Verbena, Calceolaria, Geranium, Dahlia, &c. &c. now out, either in Collections or by the single plant.

Plants of the New Black Nemophylla, 9*d.* each. Potter's Liquid Guano, in quart bottles, 1*s.* 9*d.* each. Super-phosphate of Lime, in 7 lb. packets, at 1*s.* each. Whitney's Chemical Transparent Waterproof Composition, with directions for use; in pints, 2*s.* 6*d.* each, quarts, 4*s.* 6*d.* each.

For their Advertisements of new and choice Flower and Vegetable Seeds, see their lists in Harrison's "Cabinet" for April, and the preceding Numbers of the *Gardeners' Chronicle*.

Petunia Punctata is now ready for sending out, 7*s.* 6*d.* each.

SPLENDID LARGE, DEEP-BLUE ANAGALLIS and SUPERB CINERARIAS.—Plants of that large, splendid deep-blue, full and complete round-petalled ANAGALLIS BREWERII, being of a strong and vigorous habit, are well adapted for bedding out; 12*s.* per dozen.

SUPERB CINERARIA SEED, saved from the most esteemed named kinds, and other new and beautiful Seedlings, comprising every shade of dark and light-blue, at 2*s.* 6*d.* per packet. Strong flowering plants of the above, 12*s.* per dozen. Applications, including Post-office orders, will be immediately executed.—Direct to MICHAEL BREWER, Sen., Cambridge Nursery.

MAY'S "QUEEN OF MAY" CINERARIA.—The above new and beautiful Cineraria is now ready to be sent out by post, or otherwise, at 5*s.* 6*d.* each, including case, prepaid. It is confidently recommended as being one of the most splendid novelties that has been offered in Cinerarias; the colour being a beautiful light sky-blue; the flowers large and of good form; the plants compact, shrubby, and dwarf in growth—may be had of the principal Nurserymen in the kingdom.

W. M. begs to state that his descriptive List of new, superb Calceolarias may be had on application to WILLIAM MAY, Hope Nursery, Bedale, Yorkshire.

W. M. also begs to intimate that he cannot supply any more Eucharidium grandiflorum.

PETUNIA PUNCTATA.—Flowers of this Beautiful Plant were last week submitted to the Editors of the *Gardeners' Chronicle* and *Gardeners' Gazette*, and noticed as follows:—

DR. LINDLEY.—"*W. M.*—The bloom received of this variety agrees with the favourable opinion expressed of it in the autumn of last year."

MR. GLENNY.—"We have received two flowers of this beautiful variety, and we must admit that it is everything good that has been said of it. The flower is very large; a very beautiful purple, with blotches of white towards the centre and in the throat, and it makes some of the others look very poor."

Good Plants may still be had, 7*s.* 6*d.* each, post free, or in pots, as desired. The usual allowance when three or more are taken at once.

N.B.—A Large Specimen may now be seen in bloom at William Miller's, Providence Nursery, Ramsgate.—May 9.

GLOXINIA ROSEA ALBA; Figured in the present Number of the "Florists' Journal."

EXTRACT.—"Our present illustration, G. rosea alba, is an hybrid obtained from seed of *candida*, impregnated with the pollen of *rubra*. Its beautiful intermediate colour at once proclaims its origin; and we have no doubt it will speedily become a favourite."—*Florists' Journal*, May 1, 1844, by the Editor.

The flower is of a lovely and delicate rose colour, with a pure white throat; habit of G. rubra, and a prolific bloomer.

Strong Plants now ready for sending out, at 7*s.* 6*d.* each; discount to the trade, if three plants are taken. Apply to Wm. E. RENDLE, Union Road Nursery, Plymouth.—May 6, 1844.

WM. JOHN CORMACK, AGRICULTURAL SEEDSMAN by Appointment to His Royal Highness PRINCE ALBERT, New Cross, Surrey, and Bedford Conservatory, Covent Garden, begs to call the attention of the Nobility, Gentry, and Agriculturists in general to his combinations of GRASS SEEDS for Permanent Pasture, the Alternate Husbandry, Parks, Lawns, &c. (as recommended and practised by his partner, the late Mr. GEORGE SINCLAIR, Author of the "Hortus Gramineus Woburnensis.") Upwards of 25,000 acres have been converted to permanent pasture by this establishment with the greatest success. Parties requiring Seeds are respectfully requested to state the nature of the soils. Mangold Wurzel, Carrot, and Turnip-seed of excellent sorts, saved from transplanted bulbs. Garden and Agricultural Seeds of the best quality and most approved kinds.

N.B.—Cormack's British Queen and Prince Albert Peas, at 3*s.* 6*d.* per quart.

SHADES FOR GREENHOUSES.

J. WEEKS & Co., ARCHITECTS, Hothouse Builders, &c., Gloucester-place, Chelsea, beg to inform Horticulturists that they have made great improvements in their excellent and simple plan of Shading, whereby the largest or smallest can be instantly covered or uncovered with a sheet of canvas. To be seen in use at most of the London Nurseries, and at the Horticultural Manufactory, Gloucester-pla., Chelsea, near Sloane-sq.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

THE following Articles, manufactured in Slate for Horticultural purposes, may be seen in use at Worton Cottage, upon application to the gardener (Sundays excepted).

Tank Covers	Bottoms for Frames
Cisterns	Boxes for Balconies and Verandahs
Shelves	Orange Tubs, Flower Boxes, &c.
Garden Edging	

EDWARD BECK will be happy to answer any inquiries, either personally or by post.

DEED of a superior quality for Cottages Orné, Swiss and Rustic Cottages, Lodges, Dairies, Meat-Safes, Aviaries, Farm Buildings, and other Horticultural and Agricultural Purposes, article has obtained on application to Mr. LARKE, Ramsey, Hunt-

*** All

R. WHITE & Co. beg now to offer Plants of the following, viz., Achimenes longiflora, strong Plants for specimens on their own bottoms, at 2*s.* each; Do. do., good flowering Plants at 9*s.* per dozen. Achimenes grandiflora, strong specimen roots, 3*s.* 6*d.* each; Do., smaller, 2*s.* A. pedunculata, do., 1*s.* each; A. coccinea, do., specimen, 9*s.* per doz. A. rosea, do. do., 9*s.* per dozen. ANAGALLIS BREWERII, 1*s.* each, or 9*s.* per dozen. CHRYSANTHEMUMS, 40 superb varieties, one plant of each, 21*s.* DAHLIAS, including all the finest old varieties, and the following new ones, viz., Standard of Perfection, Orange Superb, Lady Antrobus, Emma Noke, Madame Chevain, Essex Triumph, Oakley's Surprise, Antagonist, Blue Bonnet, Queen of the Isles, &c. &c., at very moderate rates, or where the selection is left to us, at 10*s.* 6*d.* per dozen, or 50*s.* per 100, which may include the last-named five new kinds, and will be made up with other really good sorts.

FUCHSIAS—London Rival, Globosa Grandiflora, Espartero, Stanwelliana, Prince of Wales, Monarch, Bridegroom, Integrifolia, Kentish Hero, and all the other new kinds, at moderate prices, or a Collection of 20 superb kinds, including some of the new ones, and any of the following, viz., Venus victrix, Exoniensis, Lancii, Greenwich Rival, Magnifica, Gigantica grandiflora, St. Clare, Bruciana, Eximia, Woodsii, Conspicua, Arborea, Devonia, Splendens, Youellii, Formosa elegans, &c., for 21*s.*, or 10 for 10*s.* 6*d.*

GERANIUMS in superb collections, 40 good varieties, 63*s.*; 20 do. do., 42*s.*

PETUNIAS, good sorts, per dozen, 4*s.* The following new varieties:—Punctata, Beauty Supreme, Celestial, Formosa, Ne plus Ultra, Splendida, Speciosissima, Multiflora punicea, Gem, Superb, 21*s.* the Collection, or separately at moderate rates.

VERBENAS.—Finest old varieties, per doz., 4*s.* The following are seedlings, viz.:—White's Wonder, Perfection, Modesty, Variabilis, Cooperii, Surprise, Simperii, Stewart's Queen of the Whites, Azurea grandiflora, Carnea superba, Pearson's Teucroides atrosanguinea, do. Princess Alice, Speciosissima, Beauty Supreme, Teucroides cœlestina, Miller's Blue Queen, Zeuxis, Smith's Excelsa, Array, Delicata, and Striata—the Collection, 31*s.* 6*d.*

Scarlet Geraniums, Heliotropes, Calceolarias, &c. &c., for bedding out; and every description of plant at moderate prices.

Orders from unknown correspondents must be accompanied by remittance; and orders amounting to 5*l.* will be delivered free.—Bone Manure—Dust, 20*s.*, Mixed, 19*s.* per qr.; Guano, 11*s.* per cwt., or 10*l.* per ton, warranted genuine. Agents, by appointment, for the sale of Whitney's Composition.

Poole Nursery, Dorsetshire.

JOHN RIVERS, Sawbridgeworth, Herts, begs to inform Agriculturists in general that the MANGOLD WURZEL and SWEDISH TURNIP enumerated beneath are new and of his own growth, and can be recommended with confidence. The Russian Swede, with yellow skin and yellow flesh, was imported by him in 1836, it has been since carefully selected, and is recommended for productiveness and superior hardiness, and for its not being so liable to mildew as the Liverpool and other dark-coloured varieties.

Long yellow Mangold Wurzel, growing much out of the ground, fangless, with fine top	1*s.* per lb.
White-fleshed, purple-skinned Globe, for thin soils,	1*s.* per lb.
Long Purple, superior stock	9*d.* per lb.
Russian Yellow Swedish Turnip	2*s.* per lb.

Carriage paid to London.

Lawn Grasses, mixed with dwarf Clovers, warranted to insure a fine sward (weight 20 lbs. per bushel), price 14*s.* per bushel; Pasture Grasses mixed for any description of soil, varying in price from 8*s.* to 12*s.* per bushel; three bushels per acre recommended upon a clean tillage, to be sown at Midsummer, with a portion of Lucerne, Perennial Clover, and Sainfoin, upon soils that are not too retentive of moisture.

If a description of the soil intended to be laid down is given, J. R. trusts, by attentive observation of the various Pasture-Grasses, both separately and in pasture, upon various soils, to give satisfaction to those favouring him with their commands.

SKIRVING'S IMPROVED SWEDE TURNIP.

W. SKIRVING, SEEDSMAN, Queen-square, Liverpool, begs to acquaint his Agricultural Friends and the Public, that the price for the present season of the Genuine Seed of his improved Swede Turnip is 1*s.* 6*d.* per lb.; the sort warranted the same as that for which he received the Premium of the Royal Agricultural Society of England. All other sorts of Turnip-seeds of the common kinds at the usual prices; also the most approved varieties of Mangold Wurzel, large White Belgian and Altringham Carrot.

For permanent Pasture, W. SKIRVING begs to offer his Selection of the most useful Perennial Grass-seeds. The sorts selected from personal observation of the growth and habits of the different Grasses grown in his experimental Grounds at Walton. On this system he has supplied within a few years, Seeds for many thousand acres, which have given every satisfaction. Orders stating quantity and quality of land to be laid down, will be correctly executed, with a suitable mixture.

For alternate Cropping, W. S. can recommend Seed of pure Italian Rye-grass, grown and carefully saved on his own farm.

THIS DAY IS PUBLISHED, PRICE SIXPENCE, STAMPED TO GO FREE BY POST,

The FOURTH NUMBER of

The Railway Chronicle.

JOURNAL OF ENGINEERING IMPROVEMENTS, MECHANICAL INVENTIONS, PUBLIC WORKS, &c.

THERE HAS BEEN CREATED within the last ten years a PRODUCTIVE PROPERTY IN RAILWAYS amounting to more than SIXTY MILLIONS sterling, with a REVENUE of nearly SIX MILLIONS PER ANNUM. This addition to the wealth and resources of England has been produced by the Investment of the funds of nearly Fifty Thousand Individuals, who form the Railway Constituency of Great Britain. It affords employment to a great body of our Workmen, tends to the development of our industrial Capabilities, and is a boon to the whole travelling Population.

It is strongly felt that Railway property, involving interests so extensive, should not be exposed to the injurious effects which the want of sound information and the circulation of erroneous statements for party purposes so constantly produce; and it has appeared, to those most capable of judging, that the mutual interests of the Proprietary, the Managers, and the Railway Executive, and the Public interests with which they are identified, have as yet found *no* organ in which they can be fairly discussed and satisfactorily adjusted. The Railway Chronicle has been projected to supply this deficiency, by THE ESTABLISHMENT OF AN AUTHENTIC AND IMPARTIAL MEDIUM OF COMMUNICATION BETWEEN ALL THE MEMBERS OF THE GREAT RAILWAY COMMUNITY; having especially in view the free communication of useful information, the promotion of the common interests and the general circulation of sound intelligence in all that relates to Railway property.

The Conductors of the Railway Chronicle are men of practical experience, who possess peculiar facilities for obtaining the earliest information, and who will use their anxious endeavours to advance, in every way, the great interests of Railway property, avoiding all indulgence of personal feeling, the expression of party prejudice, or the advancement of exclusive interests;—they desire, in short, to furnish an unbiassed Chronicle of facts, and a fair arena for the discussion of important opinions and principles.

The Railway Chronicle *will contain the earliest and most authentic information on the following subjects:—*

THE CONDITION AND PROSPECTS OF RAILWAYS NOW IN USE.
POSITION, PROGRESS, AND VALUE OF FOREIGN RAILWAYS.
PROGRESS OF RAILWAYS IN EXECUTION.
PROJECTED NEW RAILWAYS.
THE TRAFFIC AND REVENUE OF RAILWAYS.
THE ECONOMY OF WORKING AND EXPENDITURE.
THE VALUE OF SHARES.
PAYMENT OF CALLS, DIVIDENDS, AND DEBENTURES.
THE PROCEEDINGS AT RAILWAY MEETINGS, WITH THE DOCUMENTS LAID BEFORE SUCH MEETINGS.
WEEKLY REPORTS ON THE MONEY AND SHARE MARKETS.
THE PROCEEDINGS OF THE BOARD OF TRADE AND OTHER PUBLIC OR MUNICIPAL BODIES, SO FAR AS THEY AFFECT THE INTERESTS OF RAILWAY PROPERTY.
PARLIAMENTARY RAILWAY PROCEEDINGS.
RAILWAY LEGAL INFORMATION.
CONTRACTS FOR EXECUTION OF WORK.
STATE OF THE IRON TRADE.
ENGINEERING WORKS OF MERIT ON RAILWAYS AT HOME AND ABROAD.
ENGINEERING IMPROVEMENTS ON RAILWAYS AT HOME AND ABROAD.
MECHANICAL INVENTIONS RELATING TO RAILWAYS AT HOME AND ABROAD, ILLUSTRATED, WHEN REQUISITE, BY WOOD-CUTS.
LOCOMOTIVE IMPROVEMENTS AND INVENTIONS AT HOME AND ABROAD.
REPORTS OF THE SCIENTIFIC SOCIETIES, WHENEVER ANY SUBJECTS AFFECTING RAILWAYS ARE DISCUSSED.
RAILWAY LITERATURE.
RAILWAY PATENTS.

To eludicate which, Illustrative Maps and Engravings will be given, when necessary.

Arrangements have been made for the purpose of supplying in the Railway Chronicle the earliest information concerning the FRENCH RAILWAYS (*the figures being in English money*), in which so much British capital is now invested, and the other Railways on the Continent which are in progress or in prospect. Intelligence will leave Paris every week in time for insertion in the Railway Chronicle, which will thus contain the transactions in the Paris Railway Stocks, and receipts of the various lines up to the latest hour, and furnish the earliest notice of whatever may affect the British holder.

Weekly Reports from the London, Liverpool, Manchester, and Northern Share Markets will afford the Capitalist the means of judging of the condition of Railway investments.

Another peculiar feature of the Railway Chronicle is to consist in a series of papers on each of the Great British Railways—in which the Past History, Present Condition, and Future Prospects of every Railway will be concisely developed. It is hardly to be presumed, that the great number of persons who have of late years begun to interest themselves in Railway Property, can have had the leisure and opportunity necessary to understand the peculiar circumstances and character of each individual Railway, so as to estimate properly the relative value and prospective profit of these investments. This information will be given in the successive Numbers of the Railway Chronicle. For those who are now for the first time becoming subscribers to a Railway Paper, this feature is important, as it will enable them rapidly to obtain an acquaintance with the whole of the existing lines.

TO CAPITALISTS, BANKERS, SOLICITORS, STOCK-BROKERS, INSURANCE COMPANIES, and all who hold Money for investment, the Railway Chronicle will furnish such sound unprejudiced information as shall enable them at once to make a judicious choice for the investment of funds at their disposal.

TO ENGINEERS, the Railway Chronicle will afford information on all points of Practical Engineering that may tend to the advancement of the profession, and to the perfection of that Railway communication which their talents have placed in its present admirable condition, and which it remains for their skill to render more available to the Public, and therefore more beneficial to the Shareholder. Through this channel of intercommunication every intelligent person will have an opportunity of contributing to the common stock of knowledge, and consequently to the general welfare.

TO CONTRACTORS, MANUFACTURERS, INVENTORS, and PRACTICAL ENGINEERS and MECHANICS, the Railway Chronicle will afford the means of bringing before the Influential Part of the Railway Proprietary, such Inventions, Discoveries, Practical Works, Mechanical Improvements and Articles of Manufacture, as they may desire to introduce into Railway employment; and it will afford the means of ascertaining where their practical assistance can be required either on lines projected or in execution. Thus the columns of the Railway Chronicle will open a market for the labour of the Contractor, the inventions of the Mechanist, and the commodities of the Manufacturing Engineer.

The Railway Chronicle

Will be published EVERY SATURDAY, in time for the Morning Mails.

☞ Orders received by all Newsmen.

Office for Advertisements and Communications, 14, *Wellington-street North, Strand, London.*

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, inexecuting the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orcidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

RENDLE'S TANK SYSTEM OF HEATING.

STEPHENSON AND CO., 61, Gracechurch-street, London, Inventors of the IMPROVED CONICAL and DOUBLE CYLINDRICAL BOILERS, having been much engaged in heating buildings upon the above system with Tanks of various materials, solicit the attention of scientific Horticulturists to an Iron Tank now fitting up on their premises, which offers most decided advantages over every other article hitherto employed for the same purpose. These tanks, which are ornamental in appearance, can be made from 10 to 100 feet long and of any width and depth, and can be connected or disconnected by any working Gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of employing this much approved method of heating without the assistance of Engineers. The Tanks can be applied to Boilers and Pipes already fixed, and from the present low price of Iron will be found cheaper than of any other material. MR. RENDLE, of Plymouth, has kindly undertaken to receive orders and furnish information to any persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

BURBIDGE AND HEALY'S NEW BOILER and FURNACE for HORTICULTURAL PURPOSES. Registered under 6 & 7 Vict., Cap. 65. 130, Fleet-street, London.—BURBIDGE and HEALY respectfully inform the Horticultural Public that they have constantly on hand an extensive assortment of their new Boiler and Furnace Doors. In very numerous cases where they have been fixed, they have the highest testimonials of their complete success: for the further assurance of those who may require this apparatus, BURBIDGE and HEALY refer them to the Horticultural Society's Gardens, Chiswick; also to Mr. GLENDINNING, Garden Architect, &c. &c., Chiswick Nursery, in the same neighbourhood, where the apparatus may be seen in successful operation, in connection with their new Tanks. The following are the present prices:—

Plain Boiler.		Patent Door and Frames.	Fire-bars & Dead Plate.	Flue Door.	Damper.	Will heat of Pipe.	Forcing Pit, Length by feet.
in.	£ s.	s.	s. d.	s. d.	s. d.		
10	1 5	20	7 6	6 6	2 6	30 feet.	12 to 20
Ribbed Boiler.							
10	2 2	20	10 6	7 6	2 6	50 to 70 ft. 4 in.	Under 25 to 40
12	2 15	20	12 6	7 6	3 6	80 to 125 feet.	40 to 65
14	3 10	35	17 5	8 6	4 6	150 to 250 feet.	65 to 100
18	5 5	42	25 0	8 6	5 6	300 to 400 feet.	Warm a grapery 35ft. long, and a pit 50ft.
24	9 15	50	35 0	8 6	7 6	600 to 800 feet.	

If 3-inch pipe be used, one-third more. If 2-inch pipe, as much more.

The above quantities are rough estimates, which may be varied by enlarging or contracting the fire, or by regulating the fire door. It is possible to heat a much larger quantity of pipe with the boiler, but it would be done at great loss of fuel. The above proportions can be generally relied on as a near approximation to what is correct.

WIRE-WORK, HOT-WATER APPARATUS, GREENHOUSES, &c.

ST. THOMAS BAKER, MANOR-HOUSE, MANOR-PLACE, KING'S-ROAD, CHELSEA, Manufacturer of INVISIBLE WIRE FENCE, to resist Grazing Stock, and rendered Rabbit-proof. WIRE-WORK in Trainers, Arches for Walks, Screening, Flower-stands, Pheasantries, &c. HORTICULTURAL BUILDINGS, Green and Hothouses, Conservatories, &c. The same heated by HOT-WATER APPARATUS, on improved and economical principles.

Parties waited on in Town or Country, and Drawings and Estimates free. Work for the Trade as usual.

Ward's Cases, or Domestic Greenhouses.

GUANO (GENUINE PERUVIAN & BOLIVIAN) ON SALE, BY THE ONLY LEGAL IMPORTERS, ANTONY GIBBS AND SONS, LONDON; WM. J. MYERS AND CO., LIVERPOOL; And by their Agents, COTESWORTH, POWELL, AND PRYOR, LONDON; GIBBS, BRIGHT, & CO., LIVERPOOL and BRISTOL. 47, Lime-street, April 25, 1844.

TURNIP SEASON.

GUANO (Foreign and Potter's), RAPE-DUST, BONE-DUST, CLARKE'S COMPOST, and all other MANURES for the TURNIP CROP, to be had on the best terms, of MARK FOTHERGILL, 40, Upper Thames-street.

TO GARDENERS AND AGRICULTURISTS.

SUPER-PHOSPHATE of LIME is capable of producing a more rapid vegetation in Plants than any substance known. It may be had at Mr. LAWES' Factory, Deptford Creek, price 7s. per cwt. Phosphate of Potash, 15s. per cwt.
" Soda 12s. "
" Magnesia 9s. "
" Ammonia 1s. per lb.

*** Super-phosphate of Lime in a concentrated form may also be procured of Messrs. WARNER, 28, Cornhill, and other Seedsmen, in 7 lb. packets, price 1s.

MANURES.

BOAST AND Co.'s PATENT INORGANIC MANURES.—These strong and productive manures have already proved their superiority over all others yet adopted. It is now thoroughly understood and acknowledged by intelligent agriculturists that each plant requires a distinct manure, and it is upon this perfectly scientific principle that these manures are prepared, being formed so as to supply all the substances taken from the soil by each particular crop. They are immeasurably more efficacious, far more economical than all others, and possess the great advantage of being easily applied to the land.

Prospectuses, with full particulars, may be obtained; or will be forwarded by post on application at the Manufactory, Bow, Middlesex.

*** By the use of these Manures, any land may be rendered fertile. Wheat, &c. may be grown on the same land every year with immense advantage to the farmer, and without injury to the soil; whilst all the other crops are greatly increased.

GUANO, superior to the foreign, at a reduced price.

Manures prepared expressly for Gardeners and Florists.

THE URATE of the LONDON MANURE COMPANY, 5l. per Ton. It is with the greatest satisfaction, after three years' experience, the Company are enabled to recommend the above as one of the best manures for Barley, Oats, Spring Wheat, and more especially Turnips. By promoting a rapid growth of the latter it secures a full plant, at the same time producing a great weight per acre, and extending its beneficial effects to the succeeding crops. The Urate may be sown broadcast, or which is preferable, by the drill, at the rate of one ton to three acres, and it is desirable it should not be placed more than two inches below the surface. As a top-dressing for Wheat the Urate has been used with great advantage. Gardeners and Florists will find it very useful for Dahlias and other roots. Full particulars and Testimonials will be forwarded on application. Genuine Peruvian Guano; Phosphate and Sulphate of Ammonia; Gypsum and every other artificial Manure.

EDWARD PURSER, Secretary, 40, New Bridge Street.

FOR TURNIPS.

THE Urate of the London Manure Company, 4 guineas per ton. The London Manure Company have great pleasure in acquainting their friends that they have this day reduced the Urate from 5l. to 4 guineas per ton, at the same time pledging themselves that the quality shall be fully maintained. The Urate will be found most valuable for Turnips, by promoting a rapid growth; it secures a full plant, at the same time producing a great weight per acre, and extending its beneficial effects to the succeeding crops. It may be sown broadcast, or, which is preferable, by the drill, at the rate of one ton to 3 acres; and it is desirable it should not be placed more than 2 inches below the surface. Gardeners and Florists will find it very useful for Dahlias, and other roots. Full particulars and testimonials will be forwarded on application. Genuine Peruvian Guano; Phosphate and Sulphate Ammonia; Gypsum, and every other artificial manure.—EDWARD PURSER, Secretary, 40, New-bridge-street.

MOST IMPORTANT TO FARMERS AND GRAZIERS.

GIBBONS' DISINFECTING OINTMENT, a most effectual and perfect cure for Epidemic and Foot-rot in Sheep; also for Epidemic and Foul in Cows' Feet, and for the Grease and Thrush in Horses; prepared only by HENRY GIBBONS, Agricultural Chemist, Wolverhampton.

This Ointment effectually destroys the American grub on Fruit-trees. Sold by all respectable Druggists in Town and Country, in packets at 2s. 6d. each. Mr. William Bailey, Manufacturing Chemist, North Street, Wolverhampton, is appointed Sole Wholesale and Shipping Agent.

LIQUID MANURE.

ENGLAND INDEPENDENT OF THE WORLD FOR CORN.

THE attention of the Agricultural Interest, at this momentous crisis, is requested to the great importance of LIQUID MANURE, and the ease with which it may be appropriated, by the use of FOWLER'S PUMPS, made expressly for the purpose, either portable or fixed; Garden, Ship, and Barge Pumps; also, those for Distillers, Brewers, Soap-boilers, and Tanners, for hot and cold liquor. Pumps kept for Hire, for Excavations and Wells, Buildings heated by Hot-water, for Horticulture, and every variety of manufacturing purposes. The Trade supplied on advantageous terms, by BENJAMIN FOWLER, Engineer, &c., 63, Dorset-street, Fleet-street, London.

YORKSHIRE LAND-DRAINING ASSOCIATION. Capital, 500,000l., in Stock of 25l. Deposit 5 per Cent.—The Provisional Committee have determined to limit the time for receiving Applications for Stock in this Association to THURSDAY, the 30th instant, on which day the List will be closed, preparatory to the allotment being made. Prospectuses may be obtained from the Solicitors, Messrs. Blanchard, Richardson, and Gutch, York; or from the Secretary, J. H. CHARNOCK, Wakefield.—May 7, 1844.

DR. HALLETT'S LIQUID FERTILISER.—The beauty of Flowers, with their power of perfecting their Seeds, and the flavour and size of Fruits and Vegetables, must ever depend upon the food supplied to the plants producing them, and these a very extensive series of trials on various soils has shown, may be secured by the use of Dr. HALLETT'S CONCENTRATED LIQUID FERTILISER, which contains all the essential ingredients of the best foreign Guano, with others equally so, but not to be found by Sea Fowl, in the Atlantic Ocean. Sold at Mr. G. HALLETT'S Factory, Broad Wall, Blackfriars; Messrs. WINSTANLEY'S, Chemists, 7, Poultry; Messrs. WARNER'S, 28, Cornhill; Messrs. HURST and M'MULLEN'S, 6, Leadenhall-street; and every respectable Chemist's and Seedsman's, with directions, in stone quarts, at 1s. 6d. each, and in bottles, six times the size, at 7s. 6d. The quart requires 32 gallons of water to reduce it for use, for watering soils and growing bulbs in.

IMPORTANT TO AGRICULTURISTS AND OTHERS.

ANALYSES OF SOILS, MANURES, &c. are conducted by MR. MITCHELL, Analytical Chemist (late of the Royal Polytechnic Institution), No. 5, A., Hawley Road, Kentish Town.

N.B. Gentlemen instructed in Agricultural Chemistry. The course will comprehend the Elements of Analysis.

HAYMAKING SEASON.—Agriculturists, and others who may require the assistance of WEDLAKE'S PATENT DOUBLE-ACTION HAYMAKING MACHINE, are requested to send their orders early to the London Depôt, No. 118, Fenchurch-street, opposite Mark-lane, where one of the Machines may be inspected.

PULVERISED PURE CHARCOAL for Mixing with COMPOSTS. The above can be had in bags, containing four bushels, at 5s. per bag, including bag, and carriage, paid to London. — Apply to JOHN RIVERS, Sawbridgeworth, Herts.

GLASS SUPERSEDED FOR HORTICULTURAL PURPOSES BY

WHITNEY'S CHEMICAL, TRANSPARENT, WATERPROOF COMPOSITION, for rendering Muslin, Calico, or Linen, for the Frames of Greenhouses, Pine, Melon, or Cucumber Stoves, &c., impervious to Rain or Moisture, admitting light equal to Glass, the *burning* rays of the *sun alone* being obstructed. Houses or pits covered with Calico, &c., prepared with this Composition, embrace important advantages over Glass. The light being equally diffused in every part of the house, plants placed on the floor have as much light as those close to the covering, consequently they are not drawn up as under Glass, while they continue much longer in *bloom*, and preserve their *delicate tints unfaded* till the *blossom falls*.

Whitney's Substitute for Glass.—I have had screens of calico rendered transparent with Mr. Whitney's invaluable varnish, and used them last winter, with a success far exceeding my most sanguine expectations, though my anticipations had been considerably excited. Indeed I consider Mr. Whitney's discovery as an invaluable boon to the horticulturist, one that will bear competition with any invention connected with the art and mystery of Horticulture in modern times. My screens were about 9 feet long each, and were inclined to the wall separated about 12 inches below, and as my object was to ascertain the value of the screens, in reference to *radiation*, they were *left open at each end*. Suffice it to say, the Fuchsia, Pomegranate, Passion-flower, Japan Honeysuckle, and others still more delicate and susceptible, were effectually preserved, and that without the slightest check to their growth, or any injury whatever. I am of opinion that in this *new aspect*, it possesses a protecting influence *infinitely superior to glass*, because the effects of radiation, a most powerful source of cold, are *not intercepted by glass*, which so materially counteracts the artificial temperature within; I cannot, therefore, but conclude, that for the protection, not merely of the early blossom, but the maturation of the fruits as in the case of the Peach, Nectarine, Apricot, and Grape, these transparent screens, thus prepared, are invaluable, and their triumphant success certain. Add to this, for Cucumber and Melon frames, their superiority over glass is undoubted for preventing flagging of the foliage (sometimes being scorched) by day, and the chilling effects of radiation by night. Screens prepared with Whitney's Transparent Varnish should be also used as shades in the intensity of a summer's sun, and for protection against radiation in winter, for the stove, greenhouse and conservatory. Even in the *economy of fuel* the value of such screens is demonstrable, as less will be required to maintain an equable warmth, its escape by radiation being thus effectually checked.—J. M., 16*th April*, 1844.

Prepared by GEORGE WHITNEY, Chemist, Shrewsbury; and sold in Bottles, 2s. 6d. and 4s. 6d., with ample directions for use; and, as a protection to the public, the signature of the inventor is on each bottle. Sold by the principal Seedsmen in London and throughout the kingdom. Merchants, Seedsmen, and Florists supplied by Mr. Bailey, North-street, Wolverhampton.

KEENE'S PATENT MARBLE CEMENT.—This CEMENT is particularly adapted for the Walls and Floors of Conservatories and Greenhouses, being calculated, from its extreme hardness, to resist the wear incident to ordinary Plastering. For Floors it has a threefold advantage over Stone-paving. 1st, in its lightness; one inch in thickness of KEENE'S CEMENT sufficing where 2 to 3 inch flagging would be employed. Next, in its appearance, combining, as it does, the hardness of stone with a uniform colour and even surface free from joints; and lastly, in economy, being one-third the price of Portland paving.

The most conclusive evidence can be given of the utility of KEENE'S CEMENT for these purposes by the Patentees and Manufacturers.—JOHN BAZLEY WHITE and Sons, Millbank-street, Westminster.

WRIGHT'S STACK PRESERVER.—Hundreds of Stacks of fine Hay were saved from spontaneous combustion or discoloration in the neighbourhood of the inventor, by the use of the above invaluable instrument. The article may be seen, and bills obtained, containing testimonials to its value from experienced Farmers who have for many years proved its efficacy, at J. WRIGHT'S, Manufacturer, Ongar, Essex; J. and G. DEANE, Ironmongers, London-bridge; and of any Ironmonger in the country. Price, in box, with lock and joints, 2l. 5s.

CLEAR WHITE GLASS MILK-PANS.

APSLEY PELLATT, FALCON GLASS WORKS, Holland-street, Blackfriars-road, having made further experiments, is able to reduce the price of the Milk-Pans—as described in the *Gardeners' Chronicle*, of clear white flint glass, which is far superior to the foreign green glass—to 5s. 6d. each, or 3l. per dozen.

DRAINAGE OF LAND.—WORKMAN'S LEVEL. Invented by Mr. BAILEY DENTON. This Level is constructed on a new principle, without a spirit tube, and cannot be put out of adjustment. It enables workmen to preserve a uniform fall, and, without the complexity of a spirit-level, has all its accuracy. Price 30s. Address, WM. ROBERTS, Land Surveyor, 8, Edward-street, Hampstead Road, who tests each instrument before delivery.

SOMETHING QUITE NEW in PAPIER MACHE. MECHI, 4, Leadenhall-street, London, has just completed some extraordinary specimens of Tea-trays, Work-tables, Dressing-cases, Ink-stands, Writing-desks, Envelope-cases, and Work-boxes, in Papier Maché, richly inlaid with pearl landscapes, and ornamented in a most attractive manner. A few elegant Tables, Cabinets, and Jewel-cases, of the same material; and a first-rate assortment of Papier Tea-trays, Pole-screens, Card-racks, Tea-caddies, Card-cases, Ladies' Companions, Portfolios, Cake and Note-baskets, Vases, and every description of Tortoiseshell and Ivory-work.—A visit to MECHI'S Establishment will gratify, by exhibiting the most brilliant display of art in fancy manufactures. Catalogues gratis. The regular assortment of Plated Dessert-knives, Sheffield Plate, Table Cutlery, Strops, Razors, Scissors, Penknives, &c.

FOREIGN WINES, Greatly Reduced in Price, for CASH, in quantities of One Dozen and upwards, and which, if not approved of, will be exchanged, or the money returned.

Sherry (pale or brown) at	21s.	25s.	30s.	35s. and 40s. per doz.
Port from the wood		23s.	26s.	30s. and 34s. ditto.
Ditto, crusted		26s.	30s.	36s. and 40s. ditto.
Madeira			27s.	40s. and 48s. ditto.
Claret		30s.	40s.	50s. and 60s. ditto.
Champagne (in pints, 2s. extra)			40s.	54s. and 70s. ditto.

Bucellas 27s., Vidonia 24s., Lisbon (dry or sweet) 24s., Marsala 21s., Cape 15s. per dozen; hampers 9d., bottles 1s. 6d. per dozen, if not returned. Payment to be made on or before delivery in town, and orders from the country must be accompanied by a remittance. Samples can be tasted at the office.—CORNWALL and Co., 14, Walbrook, City.

100 CUCUMBER AND MELON BOXES AND LIGHTS for Sale. One, Two, and Three-light Boxes and Lights of all sizes ready for immediate use—best materials: packed and sent to all parts of the Kingdom by JAMES WATTS, Sash Manufacturer and Hothouse Builder, Claremont-place, Old Kent-road. Garden Lights glazed and painted complete, from 1s. per foot.

HORTICULTURAL SOCIETY OF LONDON.—LIST OF PRIZES

OFFERED AT THE EXHIBITIONS IN THE GARDENS, IN 1844.

MEDALS AND REWARDS.

The Society distributes the following Medals and Rewards; viz.:

	value—£	s.	d.
C. The Certificate	0	10	0
SB. Silver Banksian Medal	1	0	0
SK. Silver Knightian Do.	1	5	0
LS. Large Silver Do.	1	15	0
SG. Large Silver Gilt Do.	4	0	0
GB. Gold Banksian Do.	7	0	0
GK. Gold Knightian Do.	10	0	0
LG. Large Gold Do.	20	0	0

Exhibitors to whom any of these shall be awarded can exchange them one for another, or may receive their value in money, or in plate. In case an Exhibitor shall receive a First Prize in any one Letter, he shall not be entitled to receive any other Medal in the same Letter, except in *CC*, *DD*, and *EE*.

CLASS I.—FLOWERS; for which Nurserymen and Private Growers exhibit independently of each other.

A. Pelargoniums, in collections of 12 new and first-rate varieties, cultivated with superior skill, in pots of 24 to a cast. GB—SG—LS—SK.

B. Pelargoniums, in collections of 12 varieties, in pots of 12 to a cast. SG—LS—SK.

N.B. Persons exhibiting in *B* cannot also exhibit in *C*.

C. Pelargoniums, in collections of 6 varieties, in pots of 8 to a cast. LS—SB.

D. Rhododendrons, in pots; not fewer than 6 plants, in 6 varieties. LS—SK—SB.

E. Roses, in pots; Amateurs to show in collections of 12, Nurserymen in collections of 25, distinct varieties. GB—SG—LS.

N.B. It is the wish of the Society in a future season, to require Roses to be shown exclusively in pots; and not to allow cut specimens to be exhibited at all.

F. Moss Roses in loose bunches, so as to exhibit, as far as possible, the habit of the variety; in 12 varieties. SK—SB—C.

G. Other Roses, exhibited as in the last letter, and in 50 varieties. LS—SK—B—C.

N.B. No one who exhibits in this letter can also compete for the following.

H. Other Roses, exhibited as in the letter *F*, and in 25 varieties. SK—SB—C.

N.B. Higher medals than those here offered for Roses cannot be given by the Judges. And if Roses are brought for exhibition without attention to the regulations here explained, they will not be allowed to be placed on the tables.

I. Cape Heaths, in collections of 20 distinct varieties. GB—SG—LS.

N.B. It is expected that the same plant shall not be exhibited on more than one occasion.

K. Cape Heaths, in collections of 6 distinct varieties. SG—LS—SK.

N.B. No person who shows in *I* will be allowed to exhibit also in *K*.

L. Calceolarias, in sixes; in pots of 12 to the cast. LS—SK—SB.

M. Carnations, in pans of 24 distinct varieties. LS—SK—SB.

N. Picotees, in pans of 24 distinct varieties. LS—SK—SB.

O. Pinks, in pans of 24 distinct varieties. SK—SB.

CLASS II.—FLOWERS; for which all persons are admitted to equal competition.

P. Stove or Greenhouse Plants, in collections of 30 plants. GK—GB—SG—LS.

N.B. Heaths, Calceolarias, Fuchsias, Greenhouse Azaleas, Rhododendrons, Orchidaceæ, Cacti, and Pelargoniums, to be excluded from *P*, *Q*, and *R*.

Q. Stove or Greenhouse plants, in collections of 15 plants. GB—SG—LS.

N.B. Persons exhibiting in *P* not to compete in *Q* also.

R. Stove or Greenhouse plants, in collections of 6 distinct species. SG—LS—SK.

N.B. Persons exhibiting in *P* or *Q* will not be allowed to compete in *R* also.

S. Greenhouse Azaleas, in 12 distinct varieties. GB—SG—LS.

T. Greenhouse Azaleas, in 6 distinct varieties. SG—LS.

N.B. No one can show in both classes of Azaleas.

U. Stove or Greenhouse climbers, in collections of 6 species. SG—SK.

V. Exotic Orchidaceæ, in collections of not fewer than 20 species. LG—GK—GB.

N.B. Exhibitors cannot show in more than one of the classes, *V*, *W*, and *X*.

W. Exotic Orchidaceæ, in collections of not fewer than 6 species. GK—GB—SG

X. Exotic Orchidaceæ in single specimens. SG—LS—SK.

Y. Plants in glass cases, grown on Mr. Ward's plan. SG—LS—SK.

N.B. It is highly desirable that these cases be made with a movable door, so as to prevent the condensation of the water on the inner face of the glass during the time of exhibition.

Z. Distinct varieties of Tall Cacti in flower. GB—SG—LS.

N.B. The GB and SG Medals are not to be given if fewer than six varieties are exhibited.

AA. Fuchsias in collections of 12 distinct varieties. LS—SK.

BB. Cinerarias, in pots, in collections of 12 distinct varieties. SK—SB.

CC. Single specimens of new or extremely rare ornamental plants. SG—LS—SK—SB—C.

N.B. These Medals will be awarded by the Society's Officers, and not by the usual Judges. Exhibitors will particularly observe that none but new or rare plants can be exhibited under this letter. *Nothing will be regarded as new which has been exhibited in the Gardens in a previous season.*

DD. Miscellaneous subjects. SK—SB—C.

N.B. Cockscombs, Heartsease, Hydrangeas, and cut flowers, are altogether excluded from exhibition. Exhibitors under this head will not be thereby *entitled* to a pass ticket.

EE. Seedling Florists' flowers. SK—SB—C.

N.B. Every seedling must be shown singly, and must be marked with the name it is to bear. The same seedling cannot gain a prize more than once in the season. Pelargoniums are to be shown in pots, and not in a cut state. No person will be allowed to exhibit more than five seedlings at each meeting. Exhibitors under this head will not be thereby *entitled* to a pass ticket.

IN ADDITION to any medals assigned to the classes *I*, *P*, *Q*, and *W*, the SK and SB medals are offered for the two collections in those classes which shall be best named by the Exhibitor.

N.B. The Society's officers, who will make this award, will be guided in their judgment by a consideration not only of the correctness of the names, but of the accuracy of the spelling, and the neatness of the writing.

CLASS III.—FRUIT, for which Market Gardeners, Fruiterers, or persons in the habit of regularly supplying the market, and private growers, exhibit independently of each other.

N.B. All Fruit must be FULLY ripe and WELL-COLOURED; if the contrary it will be disqualified.

FF. Miscellaneous collections of Fruit, consisting of at least three different kinds, Peaches and Nectarines being considered as only one kind. GK—GB—LS.

N.B. Cucumbers, Tomatoes, Gourds, and similar Kitchen Garden produce, are excluded from this letter.

GG. Grapes. SG—LS—SK—SB.

HH. Pine-apples. SG—LS—SK—SB.

II. Peaches or Nectarines, in dishes of six specimens. SK—SB.

KK. Other kinds of Fruit. SK—SB—C.

JUDGES.—The Judges have the power of *increasing* or *diminishing* the number and value of the silver medals offered by the Society for particular objects, and also of *conferring* Silver Medals or Certificates in cases not contemplated in these regulations, if they think it necessary to do so.

The Judges are also required to bear in mind that the Society's Medals are offered less for new and curious objects, than for fine specimens of Horticultural skill, the design of the Council in instituting these meetings being not so much to encourage the collector as to reward the skilful Gardener; they are also not to make any award in cases where the objects exhibited do not appear worthy of a Medal: otherwise a bad single exhibition might obtain a prize, merely because there is no better exhibition of the same class to oppose it.

Copies of the above list may be obtained at 21, Regent-street, upon application to the Secretary.

SLOUGH NURSERY, NEAR WINDSOR,
CHOICE SELECTION OF NEW DAHLIAS, 1844.

THOMAS BROWN directs attention to his beautiful SEEDLINGS, particularly that unrivalled light flower, "LADY ST. MAUR," the superiority of which over every other of its class is too well known to need further comment. Strong and healthy plants will be ready for delivery early in May.

AURANTIA (Spary's)—Orange buff; fine form and petal. A very desirable show flower; obtained numerous prizes; 3 ft. 10s 6d

ALEXANDER (Brown's)—Maroon and crimson mottled; full and constant, centre well up, and a very useful show flower; 5 ft. 7 6

DELIGHT (Brown's)—Cream, veined and tipped with purple; petal of fine substance and high centre; very distinct to any in cultivation; 4 ft. 7 6

DESIRABLE (Brown's)—Shaded buff, quite new in colour; a good show flower; 5 ft. 7 6

LADY ST. MAUR (Brown's)—White, delicately tipped with violet purple; very deep and full, high centre, forming a beautiful outline; the petals are round, and smooth at the edge; habit of Perpetual Grand: it is decidedly the finest light flower ever offered. It attracted great admiration at Windsor, and was universally acknowledged to be the finest flower in the Exhibition: 4 to 5 ft. 10 6

NUTWITH (Brown's)—Bright crimson; a fine open-cupped petal, and a good show flower; 4 ft. 7 6

RAPHAEL (Brown's)—Dark maroon, beautifully shaded with light crimson; superior petal, of excellent form: a very novel and striking variety, and will be an acquisition to any stand; 4 ft. 10 6

REMBRANDT (Brown's)—Dark purple, very round and double, rising well in the centre, and a constant show flower. It was very successfully exhibited; 3 to 4 ft. . 10 6

EMMA NOKE (Dowding's)—Blush white, good general form and centre: a good useful show flower; 4 ft. . 10 6

ESSEX BRIDE (Turville's)—Delicate peach lilac, of excellent petal and form; 5 ft. . . . (*no discount*) 10 6

LADY ANTROBUS (Spary's)—White and lilac, mottled; good form, constant, and very useful show flower; 3 ft. 10 6

NONPAREIL (Proctor's)—Ruby scarlet, of first-rate properties; extra show flower; 4 ft. . (*no discount*) 10 6

STANDARD OF PERFECTION (Keynes')—Crimson; of very superior form; 4 ft. . . . . (*no discount*) 10 6

SIR J. STEWART RICHARDSON (Union)—Brown ruby, great depth, and excellent show flower; 4 ft. (*no discount*) 10 6

T. B. has also Selections of fine Carnations, Picotees, and all other Florists' Flowers; Plants, Fruit-trees, Shrubs, and general Nursery Stock.

A general Catalogue of Dahlias, with a List of Superb New Pansies, to be had on application.

WOODLANDS NURSERY, MARESFIELD, NEAR UCKFIELD, SUSSEX.

WILLIAM WOOD and SON respectfully invite the attention of their Friends, and Amateurs, to their Extensive Stock of New Plants, adapted for bedding, CAMELLIAS, GREENHOUSE and HERBACEOUS PLANTS, SHRUBS, and CLIMBERS, together with a Splendid Collection of the Newest and Best ROSES of the season, Catalogues of which may be had GRATIS on application.

W. W. & S. have the pleasure of offering the following at moderate prices, the selection of varieties being left entirely to themselves:—

FUCHSIAS, per dozen—Extra fine varieties, 6s. and 9s.; Extra new and fine do., 12s.; 50 fine and distinct do., for 40s.

CINERARIAS, per dozen—Fine distinct varieties, 6s. and 9s.; Extra fine and new do., 12s. and 18s.

VERBENAS, per dozen—Good and distinct varieties, 5s.; Extra fine do., 9s. and 12s.; Extra superb and new do., 18s.

PETUNIAS, per dozen—Extra fine varieties, 6s. and 9s.

The above are now ready for immediate transit, and may be had either in strong plants, packed in baskets, or they will be supplied in smaller plants, and sent by post, at the option of the purchaser.

Agents, by appointment, for the sale of WHITNEY'S CHEMICAL TRANSPARENT WATERPROOF COMPOSITION. Sold in Bottles—Pints, 2s. 6d.; Quarts, 4s. 6d. each, with printed directions for use.

SUPERB SEEDLING DAHLIAS NOW READY FOR SENDING OUT.

GAINES'S "PRINCESS ALICE,"—Pure white, very full centre, the petals finely capped; was considered by all who saw it growing the best White Dahlia; gained several prizes; a good show-flower, 4 ft., 10s. 6d.

GAINES'S TWICKENHAM RIVAL.—Fine yellow, occasionally tipped with red; a superb round thick petal, fine circular form; the best yellow yet offered to the public; gained several prizes; a good show-flower, 4 ft., 10s. 6d.

GAINES'S COUNTESS OF ZETLAND.—Blush, tipped with lilac; fine round thick petals; a good show-flower, 4 ft, 10s. 6d.

GAINES'S ENTERPRISE.—Crimson purple, a superb show-flower, 4 ft., 10s. 9d.

A List of Dahlias, Pelargoniums, Pansies, Calceolarias, Fuchsias, Verbenas, Auriculas, Cinerarias, Chrysanthemums, &c., containing many New Seedlings of first-rate qualities, may be had by application at the Nursery, Surrey-lane, Battersea.

CHEAP GERANIUMS, FUCHSIAS, CALCEOLARIAS, CHRYSANTHEMUMS, PANSIES, DAHLIAS, &c.

The *Best Market* you can send to for all the *Best Varieties* of the above popular tribes of plants is at "APPLEBY'S NURSERY," Holdgate-lane, York.

THOS. APPLEBY is now prepared to send out (not post-free, as they are generally advertised) *Strong Plants*, in the finest health, at the prices quoted below:—

Geranium-Thurtell's Pluto, at 15s. to 21s. each, and the following at 7s. 6d. each: Foster's Favourite, and Sir R. Peel Lyne's Sunrise, and Duke of Cornwall; Garth's Constellation, and Symmetry.

At 5s. each:—Garth's Wonder, Lyne's Princess Royal, Bassett's Glory of the West, Wilson's Comte d'Orsay, Foster's Nestor, Low's Queen of Sarum.

At 2s. 6d. each:—Wilson's Enchantress and Superba, Foster's Evelyne, Gipsey, Fair Maid of Devon, Grand Monarch, Madeline, Rising Sun, Queen of Fairies, Wonder of the West, Queen of Beauty.

At 1s. 6d. each:—Wilson's Anne, Foster's Beauty, Circassian, Cyrus, Comte de Paris, Evadne, Hebe, Flash, Hannah, Jessie (Foster's), Jubilee, Jupiter, Lady Cotton Sheppard, Mr. Garth, Nymph, Prince of Waterloo, Ruby, Selina, Witch, &c. Every approved older variety at very moderate prices.

FUCHSIAS.—The very best of those sent out *new last summer* at 1s. to 2s. each, or from 10s. to 15s. per dozen, and all too large to go by post. St. Clare (true!), and all the older varieties, at 6s. per dozen.

CALCEOLARIAS.—A choice collection of *really good* kinds (including Lady Constable, and many of equal merit), at 1s. to 2s. 6d. each, or from 9s. to 20s. per dozen; older kinds, for bedding, at 6s. per dozen.

CHRYSANTHEMUMS.—The very best kinds in cultivation may be selected at 1s. each, or 9s. per dozen. Or a *very choice* Collection of 54 Varieties will be supplied for 30s.

PANSIES.—T. A. has selected (with care) all the *most successful* Prize-flowers of this popular tribe, and consequently his Collection is very choice. They will be supplied (with but few exceptions), at 1s. each, or from 6s. to 10s. per dozen.

DAHLIAS.—T. A.'s Collection of those contains every variety worth growing, and strong Plants are now being sent out at 5s. to 20s. per dozen.

MISCELLANEOUS PLANTS.

A *descriptive Catalogue* of T. A.'s *general Collection* of Plants may be had gratis on application, and all Orders with which he may be favoured will be executed with the *utmost accuracy* and despatch. Extra Plants will be added to compensate for long carriage, and when an order amounts to 5l. and upwards, a discount will be given. N.B.—A few strong Plants of that *splendid new Hardy Annual*, at 5s. per dozen. A remittance or reference is respectfully requested from strangers.

BURBIDGE AND HEALY'S COOKING APPARATUS, combining Sylvester's Patents.—This Cooking Apparatus is believed to possess greater general advantages than any yet submitted to the Public, both as regards strength of material and workmanship; in fact, the laws of heat are so applied as to produce the greatest effect with the least consumption of fuel, without destruction to the Apparatus; and B. and H. can safely recommend it from experience, as unquestionably superior to anything of the kind hitherto made. A Prospectus can be forwarded, upon application, detailing particulars and prices, to 130, Fleet-street.

METCALFE'S NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most effectual and extraordinary manner, and is famous for the hairs not coming loose—1s. An improved Clothes Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh Brushes, of improved graduated and powerful friction. Velvet Brushes, which act in the most surprising and successful manner. The Genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE'S Sole Establishment, 130B, Oxford-street, one door from Holles-street.

Caution—Beware of the words "From Metcalfe's," adopted by some houses.

EXTRACT FROM OLD MOORE'S ALMANACK for MAY, 1844.—"CARE OF HEALTH.—The human frame often suffers greatly during this season, the hurtful influence of which is assisted by the premature adoption of the dress of summer. Those on whom the blight of consumption has fallen, frequently sink under it about this period, though the disease had commenced its ravages many weeks or months anterior to its fatal close. All unnecessary exposure on the part of such delicate persons to the morning and evening chills, should be carefully avoided. Also the full and plethoric will be benefited by the use of cooling medicines as PARR'S LIFE PILLS, and very temperate diet; as a tendency of blood to the head is not uncommon among such, giving rise to apoplexy and other fatal diseases of the brain. Young and stout persons even require some cooling purgative, as PARR'S LIFE PILLS, which will lessen the heat of the skin, and perfectly cleanse the system."—PARR'S LIFE PILLS are sold by all respectable Medicine Vendors. See the words PARR'S LIFE PILLS, in White Letters on a Red Ground, on the Government Stamp.—Sold in boxes at 1s. 1½d., 2s. 9d., and family packets 11s. each.—T. ROBERTS and Co, 9, Crane-court, Fleet-street.

DRYING BOTANICAL SPECIMENS.—The great inconvenience experienced by Botanists from the want of suitable PAPER FOR DRYING PLANTS, has induced W. and T. BATTAIL to direct their attention to the Manufacture of an article expressly for the purpose. They now have the pleasure of offering a Paper which they hope will be found to possess all the requisite qualities, and to be peculiarly adapted for the purpose. The numerous flattering Testimonials W. and T. B. have received from their friends enabling them to recommend it with confidence, they respectfully solicit the patronage of the Botanical public whose interests they are endeavouring to serve.

To be had of the Manufacturers, price, per ream, 20*s.*; half-ream, 10*s.* 6*d.*; delivered free in London—size of sheet, 20 inches by 12 when folded. Specimens of the Paper will be forwarded on application, and all orders promptly executed.—Paper Mills, Halstead, Essex, April 30.

LYNDON'S PATENT GARDEN SPADES.—These excellent Spades, warranted to bear a knife edge, and wear as long as three Spades made in the usual way, are sold by JOHN SHEWEN, Ironmonger, Sevenoaks, to whom orders may be addressed, and will receive prompt attention.

NEW DOUBLE WHITE BRUGMANSIA, B. KNIGHTII. THOMAS CRIPPS, Nurseryman, Tunbridge Wells, respectfully intimates to his Friends he has now ready for sending out Plants of the above Double and delightfully fragrant dwarf-flowering Brugmansia, at 21*s.* each, in 48 sized pots, or small, in thumb pots, 15*s.*, with the usual discount to the Trade.

The Gardeners' Chronicle.

TUESDAY, May 21	Linnæan Anniversary	.	1 P.M.

COUNTRY SHOWS.—THURSDAY, May 16.—Tottenham and Edmonton.

WHEN, during the last war, the united efforts of French excisemen and English sailors succeeded in depriving our continental neighbours of Sugar and Coffee, the attention of ingenious men was directed to the possibility of substituting articles of European growth for such produce. Hence arose the preparation of Beet-sugar and the cultivation of CHICORY: the former is a well-known branch of modern French industry, excluded from this country; the latter, not being objected to by the Excise, is coming into cultivation with us, and promises to be an article of considerable importance. We therefore gladly avail ourselves of the kindness of a friend to publish, in another column, some practical information respecting the details of its management. The many inquiries that have been made of us lately assure us that the subject will prove interesting to our readers.

Chicory, or, as the French call it, *Chicorée*, is the Cichorium Intybus, a way-side plant, with beautiful blue flowers, resembling those of the Dandelion, except in colour. It has a stout tap-root, which, like that of the Wild Carrot, seems to improve rapidly in the hands of skilful gardeners. In the winter the French force its roots to produce blanched leaves in Mushroom-houses, cellars, and other dark places, when it forms a salad called *Barbe da Capucin*, much too bitter for English tastes; they have even a variety which forms as good a heart of leaves as Batavian Endive. It is also, with the French, a common field-crop for the sale of the leaves, which are described as being excellent for cows, when laid down with half Red Clover.

The Chicory that is cultivated as a substitute for Coffee is a variety of this plant, with long fleshy roots, like White Carrots; the French call it *Chicorée à café*. These large fleshy roots are what the cultivator desires to obtain; and a part of his business is to take care that all the plants which indicate a disposition to form woody roots are carefully eradicated. When fit for use, the roots are washed and cut into dice, which are dried, roasted, and mixed with Coffee—to which, in the opinion of many persons, they communicate a very agreeable flavour. This, at least, is certain, that they do no harm; on the contrary, their bitterness will probably render them wholesome.

In an early publication we shall state the duty on Chicory, and the Excise regulations, when the change, which we understand they are likely to undergo, is determined upon.

IF there were no other reasons for multiplying experiments, they would be of the utmost value as a means of giving gardeners the habit of observing more things than they are accustomed to look after. If it were possible to infuse a taste for investigating Nature into the minds of those who have, of all men, the best opportunities of interrogating her, it would be at once a gain to science and an unceasing source of gratification to themselves. The habit of experimenting is one of the most likely means to effect this object, provided the experiments are conducted with scrupulous accuracy, because they necessarily fix attention upon minute details and train the mind to observation.

Every man probably thinks himself an observer, and yet it is surprising how few really understand what they see. Compare the meagre pages of nine-tenths of modern travellers with those of Humboldt, and the difference between those who know how to use their eyes and those who do not is at once made evident. The truth is, that knowledge is necessary before correct observations can be made, and that knowledge must be gained by slow and patient study—not of books alone, but of things, explained by books. Carefully-conducted experiments render an acquaintance with both indispensable, and are sure to entice people to use their reasoning and observing powers.

There is no limit to the field of experiment; on the contrary, its horizon recedes as we advance; and hence, one of its peculiar charms. It is alike open to the occupant of a cottage, with a rod or two of ground, and to the holder of many acres. The chief expense it necessarily incurs is that of time and attention. If success brings its gratification, failure produces no disappointment, for something useful is learned in either case; some fact being obtained which may be afterwards applied in other experiments.

As a specimen of a good experiment of a simple kind, and which it is desirable to work out more fully, we will take the following singular results, obtained by a friend near St. Albans.

His object was to ascertain whether or not the enormous expense of carting manure could not be diminished. All those who live near London know that, except within a few miles of the metropolis, stable litter is not worth carriage, and that a distance of 20 miles is as effectual a barrier to its use as 100 miles would be. But that would not be the case if its bulk could be materially reduced. Our correspondent, therefore, tried the effect of burning it; and, if his experiment can be trusted, the results are of considerable importance, because it shows that stable litter burnt to ashes is nearly as effectual as the common bulky material.

The trial was made, as all trials should be, *on an exhausted soil*, consisting of a heavy loam. Turnips were sown on the 21st of last June in drills, 27 inches apart; and the space occupied by each experiment was exactly the same; viz., about the thirtieth of an acre.

	No. of Turnips	Gross Weight.
No. 1.—No manure . . .	230	88lb.
No. 2.—Horse dung, 4 cwt.; lime, half a bushel; the lime was slacked, and mixed with the dung 6 weeks before it was put into the soil; this was for the purpose of driving off the Ammonia .	308	462
No. 3.—Horse dung, 4 cwt.; sulphuric acid, 2 lb.; applied 6 weeks before it was put into the soil; this was for the purpose of fixing the Ammonia . .	323	444
No. 4.—Horse dung, 4 cwt.; thrown into a heap about 6 weeks before application	261	392
No. 5.—Horse dung, 6 cwt.; same as last	306	429
No. 6.—Horse dung, 8 cwt.; same as last	321	518
No. 7.—Horse dung, 5 cwt.; burnt to ashes, with free access of air . .	285	429
No. 8.—Dung, 5 cwt.; burnt with a very limited supply of air, until the vegetable matter was converted into charcoal	282	455
No. 9.—Dung, 5 cwt.; sulphuric acid, 5 lb.; the acid was mixed with the dung, and it was then carbonised like the last	267	417
No. 10.—No manure	180	70

Now, if these results can be relied on, we shall come to the conclusion, 1st, That 5 cwt. of stable litter when burnt is as good for Turnips as 6 cwt. of raw manure; and 2, that after all that has been said about the importance of ammonia in manure, the crops are as good where that principle is driven off as where it is retained by fixing. We do not in this case say that we trust the results that were obtained; but as we know that they are perfectly genuine, we would recommend a repetition of the experiment to others, especially to gardeners, who can easily renew it on the crops under their care.

Another useful experiment is suggested by the observation of a correspondent at p. 267, that "moulding up Potatoes retards the formation of the tubers." Is that true? We think not. But, if it be true, then a great deal of labour is annually expended unprofitably. The theory of earthing up Potatoes is this: Potatoes are stunted and swollen branches proceeding from the sides of the main stems, which alone rise into the air, clothe themselves with leaves, and so convey their food to the underground progeny. This is sufficiently proved by such instances as that represented below, where, owing to accidental causes, all the growth was effected in the dark, and the formation of the tubers took place in every direction among the branches. Now the quantity of lateral branches will be in proportion to the quantity of earth through which the main stem passes; tubers are lateral branches, and therefore the quantity of tubers will be regulated by the same cause. Moulding up is a contrivance to increase the quantity of earth through which the main stems have to pass, and should therefore, according to theory, be a beneficial operation. Nevertheless, the correspondent above alluded to denies its utility, and, in fact, pronounces it to be disadvantageous. Experiment must be the judge between him and others.

We do not find in books anything very positive upon this point. Mr. Towers,* indeed, mentions a case in which, after carefully layering the haulm, and covering it with soil as the shoots advanced in their growth, he obtained no tubers from the layers, although from the main stem he collected 7½ lbs; but then his layers grew with excessive rankness—a circumstance most unfavourable to the produce of the Potato, that is, to the formation of those stunted branches which become tubers. Had he stopped or checked his layers, the result might have been different.

And this leads us to suggest another experiment with the Potato, which is the pinching off the end of the stems for a quarter of their length, when they have made about half their growth. This would indeed destroy a portion of the leaves, whose action swells the tubers and causes their starchy contents to form; but then it would also temporarily arrest the flow of sap, and might compel it to direct itself towards the lateral buds of the underground stems, forcing them into the state of Potatoes. The question is, whether the plants would suffer more by the loss of their leaves than they would gain by the stoppage of the sap. It may be that many small and useless tubers would be the consequence of the operation. It may be that the other tubers would become larger. It may be that no effect would be produced. This, then, is also a fair subject for experiment.

THE SPOT ON THE LEAVES OF THE PELARGONIUM is one of those diseases which nobody seems to understand. Last year our columns contained some discussion upon the subject, but nothing satisfactory was elicited. Cold, bad soil, the attacks of insects, are all suggested; the former appearing to gardeners, though not to us, the more probable. Mr. Ayres stated that he stopped it by pricking the infected part with the point of a penknife (p. 428), and Dr. Ingle mentioned his having recovered his plants by watering them with a dilute solution of nitro-muriatic acid (p. 541). This evidently leaned to the correctness of our own view that it is the soil which produces the mischief. We should be much obliged to our correspondents for the result of their observations since that time; and we are sure that hundreds of Pelargonium growers would be equally grateful.

In the meanwhile, for their guidance, we beg to give the following case, which has occurred to our correspondent "Winton:"—"This season I have generally adopted the one-shift system into No. 16 pots, in a mixture of leaf-mould, loam, and peat, with a somewhat liberal proportion of charcoal. About six weeks since I applied, according to your advice, a wine-glass of superphosphate of lime as a top-dressing. Nothing could exceed the beautiful appearance of the plants, until about ten days ago, when I first perceived a few spotted leaves, since which the disease has been rapidly advancing throughout my collection. I may say I have scarcely one plant, out of about one

* Domestic Gardeners' Manual, p. 207.

hundred and twenty, free from infection. I looked over them this morning, and removed more than seven hundred infected leaves. I should have left many without a leaf if I had determined to remove all that had a speck on them. I have syringed rather freely, and closed my house early these last seven or eight weeks, acting upon last year's experience, and nothing could exceed my success then.

WHEN (at p. 182. 1844). we noticed MR. HAMILTON'S WORK ON THE PINE-APPLE, we expressed a wish to have some evidence as to the quality of the fruit obtained by his system of cultivation. Our reason for making the inquiry was, that unfavourable reports on the subject had reached us. If we had acted on those reports, or upon the information communicated anonymously by persons from Manchester, we should have done Mr. Hamilton great injustice; but, fortunately, our experience of the world has taught us to be very cautious how we credit assertions made to the disadvantage of any man, and also how to estimate detraction when it comes before us.

We have now to say, for the information of Pine-growers, that no doubt can be entertained respecting the good quality of the Thornfield Pines. Mr. John Parkinson, of Manchester, states that they are well known to be delicious; that the Montserrats are excellent at all seasons; but that the Envilles and Providences are inferior when ripened in winter (and where are they not?). Mr. Jas. Worth, gardener to the Rev. E. T. Leigh, of Cheadle, speaks to the same effect, and expresses his unqualified approbation of all that he has seen of Mr. Hamilton's management. And finally, we can assert, upon the evidence of one who has seen the Thornfield Pines weighed, that there is no exaggeration in the reports concerning them on that head. We may add, that the guests at Mr. Philips's table have, as we know, repeatedly remarked that they never tasted richer or more juicy fruit.

We hope that Mr. Hamilton's calumniators are satisfied.

CHICORY.

THE increasing practice of mixing Chicory with coffee, and the high duty imposed on its importation, have attracted attention to its growth in this country: and it may be interesting to your readers to be acquainted with the mode and cost of cultivation. With this view I send you the result of inquiries made in the neighbourhood of York, on the correctness of which you may rely. I hope that this communication may induce gentlemen, residing in other parts of the kingdom, to send you further information on the subject.—*J. W. S.*

Q. What sort of soil appears best suited for its growth? *A.* The soil best adapted for the growth of Chicory appears to me to be rich, deep, and loamy; but it will grow upon any favourable for Turnips or Potatoes, or intermediate between cold stiff clay; or a poor thin sandy land; some favourite fields are close upon gravel; others are more of a black peaty moor land.

Q. What preparation as to fallowing or manure is best? *A.* No fallowing is absolutely required; but it is better that it should be winter-ploughed, and prepared as for Turnips; it must be as clean as possible, and if of a friable light character, not over much wrought or "loosened" in spring. The quantity of manure will depend on the condition of the land; say about 4 loads of good short dung (ashes, night-soil, &c.), laid on broad-cast, as an average to the acre when ready for rowing up, which will prevent the ridges being twice turned, as in Turnip sowing.

Q. What is the period of sowing? *A.* This will depend upon the season, and the condition of the land; the latter end of April or beginning of May are preferable.

Q. If drilled, at what distance between the rows? *A.* The double drill is in use here. The rows should be 16 to 18 inches in width, the drills 3½ inches apart. Very great care must be taken that the drills are kept clean, and not suffered to choke, or much ground may be lost, as it is difficult to tell how far they may have "missed delivery." They, and the roller attached to follow, may be worked by a quiet old pony.

Q. Does it require hoeing, and how frequently? *A.* About three weeks or a month after sowing, it will be requisite to hand-pull and weed. No hoe is ever permitted. If necessary, you may employ the pony and a light scruffler between the rows. Particular care must be paid to the cleaning and weeding. Women or young persons are generally engaged in this purpose, at 1*s.* per day. The "how frequently" will depend upon circumstances. If the land is "clean," 16 or 18 women and children may go over it twice in a season; an acre may occupy them properly about two days.

Q. At what distances ought the plants to stand in the rows? *A.* The drills must be 3½ inches wide, and the plants should be singled 2 or 3 inches apart from each other. Dibbling, where seed has failed, does not appear to answer. Those plants which "run to head" must be watched and carefully drawn when they show flower, or at the final taking up they will prove woody and worthless, like a Radish run to seed. They can be carried home and prepared for sale, in the same manner as if drawn in November.

Q. When is it ready for getting up? *A.* This depends on the season. In November, if considered ripe. Experience alone can enable you to fix the precise time. Those who have much will commence sooner than those who have less to take up.

Q. How is it harvested? *A.* The mode of harvesting here is to let the taking up to a man and his family, or a gang of men, at about 2*l.* per acre (which is considered "very bad pay," or "minimum" allowance). The spades are like dock-drawers, 18 inches long, by 2½ or 3 broad; each plant must be "lifted" with the spade, and drawn by the hand. The followers pick up the plants, and carefully twist off the tops, or leaves, throwing the roots on heaps. Here I might as well observe, that cattle of all sorts are exceedingly fond of these leaves; and it is the practice, after getting the roots away as quickly as possible, to turn a large quantity of sheep into the field, to devour the relics; or to cart them away to the pastures, whilst they are still pretty fresh. From the field the roots are taken to the most convenient washing-place; a running stream, easy of access, with a good gravelly bottom, is invaluable for this purpose. Last year a spot was cleared where a bridge crossed a stream, having a waste piece on each side, so that a cart having deposited the dirty load above, could take a clean ready-washed one below bridge; of course, a dam and wire-work was erected to prevent the Chicory floating away. When washed, it is conveyed to the manufactory, and there cut by a machine into pieces or lengths, of ¼ or ⅛ an inch; these again are riddled to separate the smaller from the larger (the thin from the thick ends) which take more drying. They are then placed on a kiln, in bags, about 16 at a time, until ready for roasting—managed in a similar way to coffee; then ground or crushed with shelling-stones, and made up for sale. When cut, it must not be allowed to remain in heaps for more than a day. Two cutters are worked by one horse; each has one knife only, and two women to feed it.

Q. What is the average crop per acre? *A.* From 3 to 5 tons.

Q. What is the estimated expense per acre? *A.* Rent, 8*l.* to 10*l.*; seed, 2 lbs. per acre, at 5*s.*; hoeing, 1*l.* 16*s.* to 2*l.*; getting up, 2*l.* The rent named is for a field ready prepared for that crop only, manure excluded.

Q. Is it cultivated by contract at so much an acre, or a ton, or by labourers at daily wages? *A.* The former answers will explain this. The preparation of the land is done by daily labourers, and the drawing of runners and the weeding; the taking up by contract; the land is let for the purpose in different ways.

Q. What is the price when cut and dried? *A.* This cannot be answered satisfactorily: it is seldom disposed of in that peculiar state. Small growers send it to the great growers ready washed, at about 5*l.* per ton. The grocers retail it in catty packages at 8*d.* per lb.

Q. Is it supposed to be profitable? *A.* If rumour is correct, and to judge from increased quantity of land cultivated, it must be a very profitable business; but many have wit enough to grow Chicory who cannot succeed in preparing it for sale.

Q. Does the crop impoverish the land? *A.* It appears certain it does not. Wheat grows very luxuriantly after even two successive crops of Chicory. It will succeed crop after crop. A field is now preparing for the fifth crop; the fourth, last year, being superior to any of the preceding ones.

FAMILIAR BOTANY.

MORPHOLOGY.—No. XIII.

The gaudy masquerader, thus equipped,
Out sallies on adventures.

Quo teneam vultus mutantem Protea nodo?

IT would be difficult to find two things more unlike each other than the leaf of a Pæony and its petals. The one tough, green, many-lobed, and durable; the other delicate, rosy, round, and fleeting. If I can succeed in proving that they are both the same organ in different states, the case of the Morphologists, so far as those parts are concerned, is established.

The lowest leaf on the specimen before me has 15 divisions, each about 3 inches long. The next leaf above it has 9 divisions of the same size, and the stalk is much shorter. A third, as you ascend the stem, has only 5 such divisions, and the stalk is shorter still. The last leaf consists of but one such division, with a very short and flattened stalk; this is placed directly under the flower, and is the BRACT. Next follows a transition leaf, with its green part reduced to a narrow strap, and its stalk greatly widened and rounded into a thin green red-edged scale; this forms a SEPAL or division of the calyx. Immediately within this is another sepal, exactly like the last, except that it is broader, rounder, larger, thinner, yet more red-edged, and has no strap. Thereupon immediately follows a third sepal, precisely like the last, but larger; a fourth succeeds still thinner, larger, and having a considerable quantity of red upon its edges; lastly comes the fifth sepal, stained with green at the back, and thinned away at the sides into the texture of the petal, of which it has the red colour; here is a transition to the petals. The PETALS themselves differ from the last sepal in nothing, except having no green at all, and being still larger and more thin. Nothing can be more complete than these natural gradations. The leaves gradually change through a bract into sepals, without the smallest break in the chain of transition; the sepal then is a modified leaf, and, consequently, the calyx is composed of leaves. On the other hand, the sepals gradually change into petals, also without a break in the links of evidence; the petals, therefore, and, of course, the corolla, consist of modified sepals. Now, as the petals are modified sepals, and the sepals are modified leaves, the petals also are modified leaves.—Q. E. D. I do not conceive what objection can be taken to this kind of reasoning, which holds good with a large number of plants. And as what is true of a given organ in one plant, is also true of the same organ in all other plants, it follows that the calyx and corolla are always composed of modified leaves.

Men wonder how it should be possible for leaves to assume the gay colours of the flower. They forget that this happens every year in the autumn, with

Those bright leaves whose decay,
Red, yellow, or ethereally pale,
Rivals the pride of Summer.

In such instances there is no change in the form or other attributes of the leaf; it is the colour alone that alters.

One of the properties of the leaf is to produce branches from its axil. This is so constantly happening with the sepals as to require no proof. It also occurs in the petals, as for example in the common Pimpernel, for an example of which I am indebted to Mr. Boughton Kingdon. Fig. 1. In this instance two of the petals produced young shoots from their axil; and thus, without direct evidence, there would be a grave suspicion of the petals being nothing but modified leaves.

Fig. 1.

These facts enable us to account for the appearances very often presented by the flowers of plants. The common Hop occasionally bears leaves among its flowers. Fig. 2.

Fig. 2.

Upon examination we find that this is caused by the bracts, which are usually thin and greenish-white, reverting to the form of leaf, of which they are, under ordinary circumstances, a modification. Fig. 3.

Fig. 3.

In like manner the Rose will often have a ring of leaves instead of sepals. A Sheffield correspondent ("L.") has

sent me a Rose de Meaux, in which the petals are surrounded by five pinnated leaves exactly like those of the stem. In that instance the sepals had returned from their ordinary condition to that of leaves, of which they are always a transformation.

Fig. 4.

And again, in the Polyanthus, what is more common than to see a flower with its brown corolla surrounded by a ring of common leaves? Fig. 4. A specimen is now before me from Mr. Whiting, of the Deepdene, in which both calyx and corolla have undergone this transformation.

We should like to know how such an appearance is to be accounted for, except upon the supposition that the sepals, or leaves of the calyx, and common leaves, are the same thing in different states.

But it is useless to pursue this argument further.—*R.E.*

AN AMATEUR'S MELONRY.

The following description of a Melon-pit which has been for some time in successful operation may be acceptable to the readers of the *Gardeners' Chronicle*. Few persons, not professionally acquainted with the subject, know with what ease, and by how small means, a plentiful supply of Melons may be obtained, even rather early in the year. At the tables of little people this fruit is not much in request till the supply of Strawberries begins to decline; but before that time they may be well furnished with Melons, and so continue till long after the late Vinery sends in its own abundant crop. From time to time we have had details of the best methods of heating by hot water and by steam; and doubtless these are the best and perhaps the most economical where Melons are to be forced out of season and in large quantities; but where these means are precluded on the score of expense, or because well qualified persons are not kept to manage them, a perfect method of making the heat of fermenting materials available is still a desideratum. In the invention of the pit here to be described the writer's intention was to form a Melon-bed assimilating as much as possible to the natural habitat of the plant; to insure a steady supply of warmth, a body of earth not very quickly exhausted of moisture, and an atmosphere free from noxious effluvia. These objects have been attained by very simple means,—so simple and obvious as to make it matter of wonder that they have not been long in operation. The nearest approach to them has been the plan practised by Mr. Mills, with which the writer was not acquainted till his own had been some years at work. But Mr. Mills's pit is open to the objection of allowing the dung to come near to, if not in contact with, the bottom of his bed, and implicates the necessity of care in the administration of the heating materials; whereas the one in question requires no such care; the ranker the fermentation, and the coarser the materials, the better. All inequalities in the heating process are made even by the thickness of the mass of earth, and the preservation of heated air beneath the false bottom on which it rests.

Beside the pit now to be described, the writer's means are, the stable-dung of three horses,—two, or even one, eked out with leaves, Grass, or other vegetable rubbish, would serve; a labouring gardener, only employed to bring in and take out linings, and to open and shut, in the absence of the principal, or a servant who occasionally takes charge; and a thermometer, to measure bottom-heat. Nothing is to be done without a thermometer for bottom-heat. The linings require to be turned, and to have some fresh mixed in, two or three times in the season, when the thermometer indicates a declension of bottom-heat. Last summer being a wet one the fermentation went on so constantly that the linings were only turned once, when the second crop was put in. All the quackeries of compost, gradual earthing up, and so forth, may be dispensed with. The plants are taken out of the seed-bed, and put in like any Cabbage, and require no more artificial culture than sufficient pruning and the maintenance of an artificial climate implies. With these means the writer has grown Melons of the Rock and Cantaloupe and large green varieties, of from 3 to 6 lbs. weight, which have been pronounced "excellent." This year he means to try the Rockwood, and when he is better acquainted with them, some of the Persian or Cabul sorts. Were his pit to be re-constructed, he would make it square instead of oblong, for the better concentration of heat, and less exposure of surface to the cooling effect of surrounding media. At first he covered in the linings with Oak-slabs. But this is unnecessary, except for tidiness. It is probable that the addition of a trellis within the bed for the branches to spread on would be an improvement, but it is a refinement he has not yet thought worth adopting. With good stiff loam, a moderate supply of water, and progressive healthy vegetation, neither canker, parasite-fungus, nor insects, are to be dreaded.

The seedling-bed or starting-frame is put down in the usual style of a Cucumber-frame; but it would be better to put it *en suite* with the fruiting frames in the same pit. This is a two-light box, used for advancing Melon and Cucumber plants and tender annuals, and afterwards applied to the growth of two late Melons.

The Pit.—An excavation, 40 feet in length, 10½ in breadth, and 3½ in depth, being made, and lined with 9-inch brick-work, is bottomed with small chalk, rammed hard (any good material for a shoveling surface would do as well.) Within this area three frames are constructed, one of two and two of four lights, in the following manner:—The outline being marked out, four courses of 4-inch brick-work, with cross-courses of the same, are built pigeon-hole fashion; on this is laid a platform of thick slates, for a false bottom, on which the earth rests; six courses of close brick-work then follow, capped by a thick curb of Oak. On this curb the wooden frame-work rests, constructed in the usual way, but only deep enough to allow of sufficient space for the plants to respire, all the earth-bed being contained within the brick-work. The length of the lights, or otherwise the width of the beds, is a little more than five feet. More room would be better; but a narrow bed is convenient for the amateur who wishes to train his plants himself; and this leaves ample space for working the dung linings round the frames.

It is obvious that Melons growing in such beds as these know nothing of the dung that surrounds them, but by the warmth they receive through the brick sides and slate bottom; and 18 or 20 inches of earth secures their roots from sudden changes of temperature, and affords a steady supply of moisture. The same body of earth being dug and treated like an open garden bed, will serve for two or three years without change.

If the Editor thinks this plan of cultivating Melons worthy of imitation, he will, perhaps, say that it is feasible, and so give the sanction of a better name than the writer's.—*P. P.* [No doubt can be entertained about the good sense and practicability of this plan.]

Section of Pit.

Home Correspondence.

Disease in Peach-trees.—I send part of the branch of a young tree, planted only last autumn, as a specimen of the state of my trees, and of the disease by which they are affected. From this, too, you will be enabled to see the nature of the disease in its several stages, at least in three of them; for "the last stage of all, which ends this sad eventful history," is almost like the wind-up of poor human nature, "*sans* everything." The specks, like pustules, which you will perceive on the bough, about one-third of the way up, exhibit the first visible symptoms of disease; in time this speck spreads into blotches, eating its way into the fibre, as may be seen by incising the part; the next form assumed resembles that of a running sore, *i. e.*, an issue of gum from the wound; lastly, death ensues. I need scarcely say that during this progress the leaves become the seat of attack from aphides; they, in their turn, being attended by their ever-constant nurses, the ants. My garden is surrounded by a capital wall, covering about an acre, the aspect good and thoroughly open, on a plain, not absolutely low, though relatively somewhat so, in comparison with the neighbouring hills; these latter are not, however, by any means close to the garden, nor can I perceive one circumstance connected with the situation capable of accounting for the unhealthiness of the Peach and Nectarine-trees. The soil naturally is clay, not very stiff, approaching to clayey loam; the greater part having been burnt, and other means having been taken to lighten it, it works freely and well. On my coming to the place three years ago I found the trees (I speak always of the Peaches and Nectarines) old and straggling, and what would generally be termed worn out, and I have since learned from my predecessor's friends, that for the first three or four years the trees did very well, and bore tolerably; but that afterwards they began to go off, and showed symptoms of decay. My first measures to counteract the evil were to open the borders, and at the depth of about one spit to lay a foundation of compost cement, sloping outwardly, and terminating transversely with a drain. I then planted young trees, the roots near the surface. This was the work of the autumn and winter of 1842. The result last summer was far from satisfactory, still not so bad as appearances indicate at present. Desirous of persevering in what I conceived to be a right course, I removed more trees last autumn, replacing them with young ones from a distance of seven miles: from one of these the specimen I now send was cut. Perceiving, when the old trees were removed, that they had but little root, at the suggestion of my gardener I removed much of the old soil, which was burnt clay, and substituted good virgin loam, free from a particle of clay. Of all my trees, those planted last year in the new mould decidedly exhibit the worst appearance; and having gone to the expense of having my wall newly pointed, I have now for my trouble and cost the melancholy spectacle of a long range of brick-work, studded with young trees, which exhibit every appearance of premature decay. I own I am baffled both for a cause and a cure. The only possible course to pursue which now suggests itself to my mind, is to try the experiment of applying different sorts of mould to several different trees, varying the application in every conceivable way within my power. These experiments, however, must necessarily abide the approach of autumn and winter, and in the mean time I tremble for the fate of my trees. Gloucestershire is my county; the situation of my house a few miles from Cheltenham. —*Omikron.* [We publish this curious case, in the hope that it may excite the attention and elicit the opinions of some of our correspondents. It is clear that the soil is not in fault. The climate will not account for the case. It is worthy of remark, too, that the trees planted *last autumn* are already diseased. The malady cannot, then, have been caught in "Omikron's" garden. Judging from the specimen sent us, we should say that the mischief is all traceable to ill-ripened wood, insufficiently pruned, and suddenly transferred to a hot situation. The shoot sent us is green, and by no means firm. It looks like the upper part of the branch of a tree from the open quarter of some nursery. When the Peach is grown fast, in shady places, its wood wants the hardness and dark red colour that are natural to it, and becomes filled with imperfectly elaborated sap. If a plant in such a state is transferred to a south wall, some change, both chemical and organic, takes place, and the over-abundant sap finds its way through the surface in the form of gum, causing wounds which rapidly mortify. The remedy in that case is to cut the wood back even further than ordinary, so as to have nothing more than what is thoroughly ripe. "Omikron" would do well to consult a paper on the Peach, by Mr. Knight, read to the Horticultural Society, May 6, 1817—and also published in his "Horticultural Papers," p. 227. If he can, by laying his branches in thin, contrive to get his wood well ripened, and in winter-pruning will cut away all that is not so, he will, we think, get rid of his trouble.]

Grafting Fuchsias.—Your readers may exercise their taste in combining very opposite groups of blossoms, if they take the present opportunity of grafting or inarching the strong young growing shoots of the Fuchsia. For this purpose a warm moist atmosphere is necessary. I find the readiest mode is to select two plants, and within three inches of the heads to cut away half the thickness of the shoots, extending about 1¼ inch; the two mutilated heads are firmly bound with soft bast, and the intended scion is then nearly severed just below the junction; within three days the scion may be cut clean through, and no check to its growth will be perceived; the head of the stock is now removed, the scion takes the lead, surrounded by laterals of the other variety. The best stocks are the strong growing kinds, as Fulgens, Cormackii, &c.; this latter, in combination with Conspicua arborea, is very effective.—*M., Deptford.*

The Robin.—In the latter end of the year 1841 a robin flew into the cottage of Mrs. Wilkinson, in the neighbourhood of Overton, near Lancaster; being winter season, it was kindly treated, and did not offer to leave its quarters; it was without hesitation accommodated with bed and board. When spring time came, it resumed its free denizenship of the air, but not ungratefully, for it was always seen about her garden, and even came fluttering around its kind mistress when she went out. Being the male bird, it chose for itself a mate; a nest was built in a hawthorn bush, wherein four little ones were reared; some time after they were fairly on the wing, a gentle tapping was heard one evening at Mrs. Wilkinson's casement window. On being opened, to her surprise, in flew her favourite robin, with his family. They all received a hearty welcome, and remained there until the spring. This conduct has been pursued every year since, to the present year; and no less than eight robins have taken up their winter quarters in Mrs. Wilkinson's kitchen. If the window be not opened, the old robin will perch upon the latch of the door, and, fluttering with his wings, jingle it until he is let in; he perches upon her shoulder or her hand, if she holds it out to him, and will sing his merry song as if in grateful acknowledgment of the hospitality shown to his co-mates and himself. This fact is well known to every one in the neighbourhood.—*S. G. Garstang.*

Charcoal.—The following method of making charcoal, which I have adopted with complete success, may be useful to some of your amateur readers, who, like myself, want the article, and can find nobody in the neighbourhood who understands how to make it. I cut up a quantity of wood into billets of about 18 inches long, and placed three or four wheelbarrowfuls upon a handful of straw and a few dry sticks, and set fire to the straw. As the wood began to ignite I surrounded it with sods from the side of the road, tolerably dry, and common road dirt (throwing on the latter in lumps, so as not completely to exclude the air), until the wood was covered all over. Soon the whole heap was burning together, and as the fire made its appearance through the dirt, or rather as the dirt became burnt, I threw on more dirt. At night I added as much as I thought would be burned by the morning, and thus the heap was kept burning for several days. Upon clearing away the burnt earth I found the wood I had used for lighting the fire completely charred, but not a stick consumed. Thus, I have accomplished two objects by one operation: I have made charcoal as well as a regular professor of that art; and have also prepared a capital compost of burnt earth and sods, which I intend to enrich by dosing it with liquid manure. I have made several heaps since I first made the attempt, and have not failed in a single instance. The wood I used is Black Poplar, as I happened to have a quantity by me, which was cut last winter. I also gave the preference to this material, from having read lately in the *Chronicle*, that the lightest wood made the best charcoal.—*John Lowder.*

Seedling Pelargoniums.—In "The Gardener and

Practical Florist," (?) for the present month, is an article, by a Mr. J. Heriot, On the Management of Seedling Pelargoniums, wherein he says that he had inquired of one of the leading nurserymen in London how long he took to flower his seedlings, and the answer was *two years*. This period Mr. H. imagines to be a little too long; and he has taken some pains to describe a method which, he says, "originated from his own ideas," and by which he is able to flower his seedlings in the short space of fourteen or fifteen months. Perhaps Mr. H. and his friend, the nurseryman, will be not a little surprised when they hear that Seedling Pelargoniums can be flowered in eight months. I was lately in the garden of C. Gyde, Esq., of Painswick, who showed me some seedlings in flower, and a great many were showing strong flower-buds; they were all raised from seed sown on the 22nd of August last; their dwarf stocky habit appeared particularly beautiful; several of their stems, from the surface of the soil to the base of the flower-stalk, measured only from 1½ inch to 4 inches high. Mr. H. recommends Pelargonium seed, saved after the 1st of August, to be kept unsown until the following spring, when, by adopting his mode of treatment, he says they will generally be brought into flower in the course of the second summer, or about fifteen or sixteen months after the seed has been sown; whereas, by Mr. Gyde's method, plants, from seed sown after the middle of August, will be producing their flowers at the time Mr. H. is sowing his seed.—*A. N., Painswick.*

Potting.—There is perhaps no condition to which the roots of plants that are cultivated in pots are liable to be exposed, which is more injurious to them than that in which the interior part of the mass of soil in which they are growing is suffered to become thoroughly dried; and, being a condition which is entirely precluded from direct observation, it is far more frequent than at first might be thought to be the case. Saturation of the soil soon becomes evident, and on that account it is far less likely to exist to any extent, in cases where even the most ordinary attention is bestowed; and, therefore, although in itself equally injurious, it is far less to be dreaded than the state of desiccation: indeed, in almost all cases, the drainage, and the mechanical texture of the soil, are so specially attended to, in the case of plants which are at all esteemed, that the saturation of the soil in which they are grown is of very rare occurrence. It is not, however, so with the condition of drought in the interior of the soil; it is on soil which lies buried and unseen, until its effects render it apparent; and this may be, perhaps, when too late to prevent its injurious consequences. Now, it is the insidious nature of this peculiar state of the soil which renders it so highly dangerous: evaporation, the mechanical action of the drainage, and the vital action of the plant, exerting a united and powerful influence, may, and do, silently deprive the soil of its moisture; and the application of water, repeated and renewed though it be, may appear to restore this element to the soil, but in reality may fall very short of doing so. Peat earth enters very largely into the compost in which most valuable plants are grown, and every gardener knows that peat earth is peculiarly subject to dryness, on account of its being favourable to the process of evaporation, and that when in this state, it is with difficulty wetted. The continual evaporation going on from the soil, the continual abstraction of moisture by the roots, and its free downward passage among the drainage, all acting at the same time, and acting most powerfully when the natural condition of the atmosphere by no means retards or prevents evaporation from the plants themselves, very soon reduces the soil to a dry and parched state. The elevation of the ball of earth too, in re-potting plants, (a process in itself to a certain extent desirable, and perhaps even necessary,) and the lowering of the soil close by the rim of the pots, both tend to conduct the water which is applied, most liberally to the sides, or exterior portions of the soil; and, under ordinary circumstances, the interior is but slightly moistened, if not, in many instances, left in its dry and parched condition. It must be evident that if these causes render the soil dry in the first instance, and continue afterwards in operation, the same result may be expected; and thus the centre of the mass of soil is rendered perpetually dry—that is, if not positively, at least comparatively, void of moisture. The injury which is done to the majority of plants, by this desiccated condition of the soil, is by no means inconsiderable; it is, in fact, a clog and impediment in the exercise of their vital functions. The most rational method of cultivating plants is to supply them uninterruptedly with *all* the elements of their nutrition and development: no one part should be unduly predominant—no one part should be altogether absent, but all should be present in their due proportions. These proportions, however, vary: the conditions of infancy are not the conditions of maturity, but each are a modified state of the same elements, peculiarly adapted for that particular period of development. Thus it is, that whilst moisture may be regarded as the element which especially influences the growth and extension of plants, so heat may be taken to have a similar influence on their fructification; but, nevertheless, heat as well as moisture is necessary to produce a perfect state of growth, and moisture as well as heat is required to produce a perfect state of fructification: it is not the elements or conditions of growth that vary, but their proportion each to the other. It has been said that the desiccation of the soil acts as an impediment to the vital functions, and this it does by serving to contract those portions of the roots which are surrounded by unvarying drought. It is true that plants are supposed to take up their fluid food only by the extremities of the roots, and therefore in this point of view they are not the less bountifully supplied, than would be the case if the whole bulk of the soil surrounding them was of a medium degree of moisture; but from a substance such as the roots of plants, formed principally of cellular matter, and surrounded only by a covering which is the same cellular substance in a somewhat more compressed state, we cannot but believe that a dry surrounding medium will abstract moisture which would otherwise be conveyed through the channel of the roots and serve to nourish the plant. It cannot be that in the transmission of fluids the vegetable root is like a metal pipe, totally uninfluenced by the circumstances which may surround it. What, then, is the condition of a plant thus circumstanced? Its main roots, the channels of its nourishment, are enveloped by a medium which is never, or but rarely moistened; its spongioles, the parts by which it takes up its food, are frequently submitted to alternations of aridity and saturation; for these spongioles exist most abundantly in the exterior part of the soil, and this it is which becomes so often dried, and alone is moistened when water is applied; what is taken up by the spongioles cannot readily and uninterruptedly pass onwards in the structure of the plant, because the dry soil causes the contraction of the principal roots, and lessens their capacity for transmitting fluids. By-and-bye an increased degree of evaporation, both from the soil and the plant itself, is induced by exterior circumstances; the supply is exhausted, the plant suffers, its leaves curl or change colour, no refreshing draught is administered, the vegetable being dies. But dangerous as this condition is in its consequences and effects, and frequent as it is in its occurrence, it does not appear to be one which admits of no palliation, nor one for which a remedy may not be applied. With respect to the spongioles, a perfect system of cultivation must be one which never submits them either to saturation or desiccation—which presents them with a gradual and progressive increase or decrease of moisture whenever these are requisite—which never submits them to sudden or constantly recurring changes—which, in short, presents them with food in a fluid state, so regulated that they cannot either become surfeited or lack a continual supply. But still the internal moisture of the soil is unprovided for. I have elsewhere stated* that "a few pieces of charcoal placed perpendicularly in the soil, and kept continually moist by some little capillary contrivance, would perhaps be the very best method of transmitting moisture, and distributing it throughout the soil;" and by the application of this to the pot culture of plants, I have no doubt the evil spoken of might be altogether avoided. I should propose it to be effected thus:—Whenever a plant (most particularly a valuable specimen-plant) is repotted, either in its infancy or maturity, I would introduce a few sticks of charcoal perpendicularly into the pot; these should be long enough to extend from the bottom of the pot to the top of the soil; about three might be placed at regular intervals, and they should be as close to the roots, and as near to the centre of the pots as possible. Thus, if a plant is shifted but once, it will be provided with some channels for moisture, extending throughout the soil; and if it be frequently repotted the number of these channels may be increased. When these are once introduced into the soil they are permanent; for, being of a material which is not subject to rapid decay, they will serve at least the lifetime of a plant, and by occasionally making use of a simple siphon—a mere worsted thread—in contact with moisture, a slow, moderate, and constant supply of moisture may be conveyed at pleasure to and through the centre of the soil, and the whole mass may thus be kept regularly and equably moistened.—*T. Moore.*

Toad versus Swan.—"There is no accounting for tastes," probably Mr. Forsythe will say; but as one fond of animals as well as a garden, I must say a few words in favour of the poor toads. Mr. F. will find that the nuisance he complains of, of "the garden and walks being croaked and crawled over with thousand of toads and frogs," would only last two or three days at most, and I doubt not that at this time his beautiful walks are occupied by much fairer forms this fine weather. The poor toads have each betaken themselves to some favourite and sheltered spot, or to the water to deposit their spawn. Now I will undertake to say, that this numerous family of toads are the best friends Mr. F. has in the garden. Let him kill one toad about midnight, and count over the worms, woodlice, ants, and beetles in his stomach; multiply their amount by the number of days between April and October; and that again by the supposed number of the toads; and I imagine Mr. F. will be satisfied that his garden will look all the greener, and flourish all the better, for the absence of what the toads have devoured. The spawn in ponds certainly is unsightly if neglected; but a boy with a rake on a hot day, will clear out a large extent of water in a few hours. The toad is really a most unobtrusive fellow, except upon the very day Mr. F. met with them, when once a year they do sally forth. If the spawn is left, the young ones again do so for about three days, or possibly a week. But excepting these times, the toad never seeks man, but lies under some stone or leafy plant, waiting till the dewy eve comes, when out he sallies, and destroys an immense number of the gardener's greatest enemies. I knew a lady who had all the toads and frogs upon her premises destroyed because she once trod upon one. It is certainly disagreeable to do so, but still more so for the toad to be trodden upon. And how many worms does he destroy, which otherwise we might tread upon also! The toad is also really a very pretty creature in his way, and we lose much gratification from being so prejudiced against them and their neighbours the snakes, when we turn away with disgust, as most do from them. I always encourage in every way the toad, frog, snake, and slow-worm, in my garden, and know few things more beautiful in nature than the bright golden eye of the first, the agile leap of the second as you disturb him in the garden, or the graceful glide of the snake; and even the slow-worm, coiled at the root of an herbaceous plant, enjoying the sun, is to me a great addition to a flower garden. My children handle all, and admire them equally with myself. If Mr. F. will place a frame of plants, and inclose a toad, and put another without, he will, I hope, like my friends better.—*W. D. F.*

Exhibitions in the Garden of the Horticultural Society.—As I intend showing Grapes at the May Show at Chiswick on Saturday, the 18th inst., probably you will say as much. I intend it as a challenge to all England. My basket will be 8 or 10 lbs. of Black Hamburgh Grapes, which will not be beaten.—*John Wilmot, Isleworth, May 9.*

Miscellaneous.—*J. W.*, a known correspondent, states that he agrees with the opinion of "*" regarding the Polyanthus as a bee-flower. He says that bees seldom or never work upon it. "J. W." further observes, that as bee-hives are now in full bustle, Apiarians will do well to follow the advice given by Mr. Savage, at p. 261 of the present year.

* Theory and Practice, applied to the Cultivation of the Cucumber. 1844. London. Groombridge.

Societies.

HORTICULTURAL SOCIETY OF LONDON.

SIR C. LEMON, Bart., M.P., in the chair. The Earl of Leicester, P. Greenall, Esq., M.P., and J. Shepherd, Esq., were elected Fellows.—From Messrs. Loddiges, of Hackney, were Dendrobium Heyneanum, in good condition; Masdevallia infracta; a fine plant of Camarotis purpurea, in excellent health; together with the beautiful Cattleya Skinneri and a remarkable specimen of Dendrobium densiflorum, having many bunches of beautiful Orange-blossoms. A Knightian medal was awarded for these.—Mr. Plant, gr. to J. H. Schroder, Esq., sent a fine Aerides crispum, producing a fine spike of purple-and-white flowers. A Banksian medal was awarded for it.—From Mr. Robertson, gr. to Mrs. Lawrence, was a collection of plants, containing a dwarf bushy specimen of Chorozema Dicksonii; a beautiful large Hovea Celsi, with very bright-coloured blossoms; Dendrobium aggregatum, in good condition; Tetranema Mexicanum, a pretty greenhouse herbaceous plant; and a good Russelia multiflora, which is one of the gayer of tender greenhouse plants. In the same collection were also a large Pimelea hypericifolia; Lalage hoveæfolia; Epacris lavigata, covered with white blossoms; Adenandra amœna; Daviesia saligna; and a variety of Hardenbergia monophylla. A Knightian medal was awarded for the four first-named plants.—From S. Rucker, Esq., was a variety (?) of Anguloa Clowesii, having large yellow flowers richly spotted in the interior with brown. This is a rare species of that hitherto almost unknown genus. A Banksian medal was awarded for it.—Mr. Carson, gr. to W. Farmer, Esq., sent a variety of Epidendrum macrochilum roseum, having a fine raceme of pale violet blossoms. A certificate was awarded for it.—From Mr. Glendinning, of Turnham Green, was a small plant of Pentas carnea, which is a scarce greenhouse plant, from South Brazil, having pale green leaves and delicate lilac blossoms; also an Indigofera, apparently incana, a plant with trailing stems, covered with gray foliage, which contrasts well with the deep purple flowers. — Mr. W. P. Ayres, gr. to J. Cook, Esq., also sent Pentas carnea, for which a certificate was awarded.—From J. Allnutt, Esq., was a good plant of Chorozema varium.—Mr. Pawley, of Bromley, sent a Seedling Azalea, named carminata, having large rather dull red blossoms.—From Messrs. Veitch & Son, of Exeter, was an Oxalis that was sent from Chili by their collector, Mr. Lobb. It is new to gardens, and will, no doubt, be an acquisition, as it is stated to be hardy, having survived all last winter, planted out on rockwork. A certificate was awarded for it.—Mr. Mountjoy, of Ealing, sent a Seedling Calceolaria, considered to be an improvement on Lady Constable, two Seedling Pansies (named Princess Alice and Prince of Wales), and a collection of Pansy blooms.—From Mr. Errington, gr. to Sir P. Egerton, Bart., was a series of flowers of Seedling Cacti, in which one, named Regalis, resembling Conway's Giant, was a very large fine flower; another named longissima, on account of the length of the tube, was a flower of considerable size and beauty; and several others gave great promise; a certificate was awarded for these.—Mr. Chapman, of Clapham, sent a basket of Dutch Sweetwater Grapes, some bunches of which weighed three-quarters of a pound; a certificate was awarded for them.— From R. W. Barchard, Esq., was a Strawberry-plant, exhibiting a curious instance of monstrosity in the fruit, most of them being fingered; some had three fingers, others had four, and in one case as many as five fingers were produced. By this singular malformation the fruit was of a very unusual shape.—Mr. Fish, gr. to H. H. Oddie, Esq., sent a Cantaloupe Melon, stated to be a seedling of his own, together with a green-flesh variety. These were good early fruit, particularly the former: they were said to have been grown in a three-light box, on a bed formed of billet and rubbish wood, about two feet deep, with six inches of long litter spread regularly over them. Above this were placed 18 inches of leaves and dung. The soil was the top spit from a common, and was strong loam. It was put in as rough as possible, and trod quite firm. The plants were watered twice with the drainings of the dunghill, and once with guano mixed with water, at the rate of one ounce to a gallon of water. No manure whatever was used in the soil; a certificate was awarded for these.—From Mr. Cuthill, of Camberwell were three fine

specimens of his Black Spine Cucumber, and another variety, raised by him, that was stated to be a good forcer. It was a handsome fruit, measuring about 18 inches long. —From the Garden of the Society were Oncidium divaricatum, a variety of Epidendrum macrochilum, Chorozema varium, two Cinerarias, Gloxinia speciosa, and a white Azalea; together with Clematis Sieboldi, Comarostaphylis arbutoides, and Arctostaphylos nitida. The two last are pretty half-hardy Mexican shrubs, having some resemblance to an Arbutus.

ENTOMOLOGICAL SOCIETY.

Monday, May 6.—George Newport, Esq., in the chair.—A paper was read from Captain Hutton, of the Native Indian Infantry, on a large and beautiful species of Moth, with a description of the peculiar mode of its escape from its cocoon, which was unlike that of any other known species, and was effected by transverse slits.—A continuation of Mr. Saunders' paper on the Chrysomelidæ of New Holland was read.—Mr. Evans presented a notice of the eggs and young larvæ of Sialis lutaria, or May-fly, which was accompanied by drawings.—A paper was read from Mr. Frederic Smith, on the habits of a species of Osmia (Wild Bee), which selected the shells of snails as a situation for forming their nests and depositing their eggs.—Mr. Saunders exhibited a specimen of gum from South America, which contained encased within it the larva of a species of Cerambyx.—Mr. Ingpen exhibited a specimen of Poecillus cupreus, which was taken in the act of devouring a common Pea. This beetle belongs to the family of Carabidæ, which were all, at one time, supposed to be carnivorous; but this, and some other species, forms a transition to the vegetable feeders among the Coleoptera.—Mr. J. F. Stephens exhibited a Moth, which was caught at Norwood, and was new to Great Britain, belonging to the genus Yponomeuta.

MICROSCOPICAL SOCIETY.

April 17.—J. F. Bowerbank, Esq., in the chair. Mr. G. L. Fitzmorris, Dr. Trueman, and Dr. Salt were elected members. Mr. J. Quekett read a paper on Ciliary Motion; he first gave an account of the discovery of cilia, which was made by a Dutch physician in 1684, and of the subsequent observations which had been made upon these organs. He also alluded to the various opinions that had been formed as to the nature of the force by which the movements of the cilia were effected. He then described the nature of the movement of a single cilium in the common muscle: all observers had agreed that this was a rotatory, or up and down movement, so that when a row of cilia were in action, as in the branchiæ of the muscle, they gave it a waved appearance. But, in addition to this movement, the author had observed a secondary movement, which was a partial twist of the cilium on its own axis, and which might be compared to that motion of the oar of a row-boat, which is called "feathering the oar." This motion is very evident when the cilia are moving slowly. It had not before been observed, and was undoubtedly of importance in those animalcules which moved through water by means of their cilia. Dr. Lankester pointed out the probability of the dependence of ciliary motion on the same force as produced muscular contractility, and referred to the observations of Professor Sharpey and Professor E. Forbes on this subject. Although Mr. Bowman and Dr. Todd had, in their late work on Physiology, endeavoured to object to this theory, he thought it at present much the most rational theory of ciliary motion. He had seen single separated cilia move, and he believed that in some instances they were mistaken for animalcules. He thought the moving cells which are found on the mucous membranes of animals ought not to be called animalcules. They were cells thrown off from a living organism, but entirely incapable of self-subsistence or self-generation. The chairman referred to the minute animalcules found between the teeth, and thought perhaps they ought not to be considered as independent animals. There was no doubt, however, that the moving bodies found in the thecæ of some Mosses were animalcules.—Dr. Lankester denied that either these or Spermatozoa were true animalcules.—Mr. J. Quekett described the nature of the Spermatozoa in the cuttle-fish, in which there was a large Spermatozoon, with several little ones inside.

LINNEAN SOCIETY.

Apr. 16.—E. Forster, Esq., in the chair. A letter was read from Mr. Edwin Lees, accompanied with specimens of rare British Rubi. Amongst these was a variety of Rubus idæus, with a ternate foliage, of which Mr. Lees had seen many specimens, and which he proposed to call R. i. fragariæsimilis.—A collection of 140 species of plants, including several rare forms of Myrtaceæ, collected by Mr. Drummond at Swan River, was presented by Mr. Hugh Low.—Mr. J. Allcard was elected a Fellow.—A continuation of Mr. Newport's paper on the Myriapoda Chilopoda was read. The theoretical structure of the head and the organs of nutrition in these animals was minutely examined, and the identity of the complicated organs of these parts with the simpler ones of the segments of the body was pointed out. The organs which constitute the best means of distinguishing the genera and species of the Myriapoda were next examined, as the ocelli, the form of the legs, the spines on the legs, &c. The dental plates had not hitherto been employed as a means of specific distinction; but in the Scolopendræ, the denticulations found on these organs were of great importance. The character of the dorsal plates was of most importance in the Sarmentiidæ, the segments of the body in Geophilidæ, the ocelli in Lithobius, and the number of the joints of the antennæ in Cryptops.

Tuesday, May 7.—Edward Forster, Esq., in the Chair. Professor Agassiz, of Neufchatel, and Dr. M. J. Schleiden, of Jena, were elected Foreign Fellows. Dr. Hugh Falconer, and Mr. G. B. Sowerby, Jun., were elected Fellows. Dr. Francis Boott, M. D. Professor Edward Forbes, and the Rev. Wm. Hinckes, were elected Auditors of Accounts at the ensuing anniversary.—A paper was announced from J. Curtis, Esq., being descriptions of Insects brought from the Straits of Magellan by Captain King.—A paper was read from Mr. Joseph Woods, on the species of Carex found in Middle Europe. The author commenced with some general remarks on the necessity of a natural classification, and pointed out its application to the various groups which had been proposed of the extensive genus Carex. Where single characters had been the basis of subdivision, the groups thus formed became unnatural. The subdivisions of Koch were undoubtedly the best that had hitherto been offered, and the author pursued the same plan. The author then entered into a minute account of the structure of the various parts of the genus Carex, pointing out their characterising value; this included a consideration of the Nut, the utriculus, the glume, the spikes, the bracts, the culm, the leaves, and the root. The remaining part of the paper was deferred till the next meeting. The Chairman reminded the meeting that the anniversary of the Society would take place on the 24th inst.

BOTANICAL SOCIETY OF LONDON.

Apr. 12.—J. Reynolds, Esq., treasurer, in the chair. Various donations were announced, including a very large collection of East Indian plants, presented by the Royal Horticultural Society of Cornwall. Mr. D. Moore, of the Dublin Botanic Garden, presented numerous specimens of Carex paradoxa (Willd.), collected in Ireland. Mr. W. L. Notcutt presented many duplicates of Statice rariflora (Dreger), collected in Hants. Various other specimens were presented for the Society's herbarium, in illustration of the varieties recorded in "The London Catalogue of British Plants."—Read, "A Synoptical View of the British Fruticose Rubi, arranged in groups, with explanatory remarks" (Part 2), by E. Lees, Esq. This Paper was accompanied by drawings and specimens.

BOTANICAL SOCIETY OF EDINBURGH.

Thursday, the 11*th April.*—Professor Graham, President, in the chair. Donations to the library and herbarium were announced from Dr. Gottsche, Altona, Mr. W. C. Trevelyan, Mr. C. C. Babington, Mr. Parker, Mr. Ogilvie, Mr. Jackson, and Mr. Ewans. The following papers were read.—

1. On four genera of Desmidieæ, by Mr. Ralfs. In these papers, which were illustrated by beautiful sketches, 14 species are described, 9 of which belong to Euastrum —2, each, to Tetramorus and Micrasterias—and 1 to Berkleya. Mr. Ralfs remarked that—"The species of Euastrum are not well defined; plants of this genus vary greatly in form, and it is not unlikely that young fronds have been described as distinct. Whenever it is practicable the frond should be examined in four different directions, namely, in the front or usual position, at the side, at the end, and by a transverse or junction view, after the segments have been separated;" and again, in describing E. gemmatum, he says—"Whilst engaged in examining this species I was first struck with the advantage to be derived from the figure of the transverse view in the discrimination of nearly allied species. I have since obtained Meneghini's Synopsis of this family, and find that he has extensively availed himself of it in forming his specific characters of this genus."

2. Note on a Monstrosity of the Pistul of Primula vulgaris; by Mr. C. C. Babington. This curious monstrosity was sent to the author by Mr. J. H. Walton, of St. Bees College. Flowers of the usual form and structure were found on the same root, with two flowers possessing the anomalous organ, which Mr. Babington describes as follows—"Within the base of the corolla is situated a small fleshy cup, from the centre of which springs a cylindrical stem, capped with another shallow fleshy cup, having a wavy margin. An exposed conical placenta, covered with peltate ovules, is seated in the centre of the latter cup. Thus the true ovary is converted into a cup-shaped body, and the capitate stigma has become an open fleshy ovary."

3. On the Fructification of Cutleria, and continuation of the Marine Algæ of the vicinity of Aberdeen. By Dr. Dickie. In this communication, (in which the remainder of the olive-coloured Algæ, hitherto observed on the Aberdeenshire coast, are enumerated) the author discusses at considerable length the characters which have been assigned to various species by different writers on Algæ, and states his own views respecting them. He also notices the comparative paucity of the marine flora of Aberdeenshire, ascribing the absence of the more delicate species, partly to the unsheltered nature of the coast, and partly to the influence of temperature, and says, "Scarcely one half of the Melanospermous Algæ, enumerated in Harvey's Manual as occurring in Britain, are found here —the proportions being as 34 to 80."

4. On some British species of Œnanthe; By John Ball, B.A. In this paper three species of Œnanthe are described as natives of Britain; viz., Œ. pimpinelloides, Linn.; Œ. Silaifolia, Bieb. (peucedanifolia, Sm.); and Œ. Lachenalii, Bab. The first is stated to be very rare, the author having only seen one specimen wanting fruit, which was gathered near Forthampton, in Gloucestershire, by Mr. E. Lees. He is, however, fully of opinion that it is the true pimpinelloides of Linnæus and the continental botanists, and proposes that the plant should resume its place as a species in the English Flora; the last is stated to be the commonest of the group,—he having received it from several parts of England, from the coast of Galloway, and from near Dunbar in Scotland. The paper concludes with the following remarks on the value of the characters of these species:—"The position and size of the tubers of the root are, I suspect, of doubtful constancy. The general disposition and proportions of the leaves are probably much to be depended on here, and throughout the order. The hollowness or solidity of the stem depends, I believe, almost wholly on the place of growth, and is of no moment. The petals vary somewhat in size, but scarcely in form, those of the outer sterile florets being always compared with each other. The form of the fruit seems not so constant as might be expected. The presence or absence of the incrassated summit of the pedicel I have never seen to vary."

COUNTRY SHOWS.

We shall, next week, state our intentions as to reporting these meetings. In the meanwhile we may as well announce our decision not to publish those details of Shows which merely state the winner's name, without the names of the plants he exhibited. This will account for some omissions in the following.

Bath Royal Horticultural Society.—This was the first Exhibition of the Society for this season. The numbers who attended the gardens during the afternoon were not less than 2000. The following prizes were awarded:—Class I.: Nurserymen.—*Stove Plants*, 1, Mr. Drummond, for Euphorbia splendens, E. fulgens, two Gesneras, and two Amaryllises. *Best* 12, 1, Mr. Carpenter, for Azalea indica alba, A. Woodii, Acacia armata, Epacris pungens, Camellia Donkelærii, C. Bealii, Cytisus racemosus, Erica multiflora, Kennedya Marryattæ, two Cinerarias, and Chorozema varium nanum. *Cinerarias*, 1, Mr. Carpenter, for Medora, Eclipse, Carmina, Unique, Lavingtonensis, and Black-eyed Susan; 2, Mr. Drummond, for Enchantress, Prince Albert, Unique, Eclipse, and two seedlings. *Camellias*, 1, Mr. Carpenter, for pulcherrima, alba, and lepida. Extra Prizes.—*Roses in Pots*, 1, Mr. Carpenter, for Devoniensis, Yellow Noisette, Yellow China, Napoleon, Prince Albert, Lee's Crimson Perpetual, Pink Moss, Spong's William Jesse, Blush Provence, Flora, and Madam Laffay. *Greenhouse Plants*—1, Mr. Carpenter, for Azalea indica alba, A. Smithii coccinea, Acacia armata, Chorozema varium nanum, Erica tricolor, Camellia Donkelærii, a Cineraria, and Kennedya cærulea. Class II. Amateurs—*Orchidaceæ*, 1, J. Jarrett, Esq., for Maxillaria aromatica, Cattleya elatior, Epidendrum selligerum. *Single specimen*, Mr. Jarrett, for Maxillaria Harrisoniæ. *Stove Plants*, 1, J. Jarrett, Esq., for Plumbago rosea, Philibertia gracilis, Ceropegia stapeliæformis; 2, Mr. Jarrett, for Ceropegia elegans, Gloxinia speciosa, Scutellaria splendens. *Greenhouse Plants*, J. M. Yeeles, Esq., for Azalea indica alba, Tropæolum grandiflorum, Chorozema spectabilis, Leschenaultia formosa. 3 *varieties*, 1, J. Jarrett, Esq., for Kennedya inophylla, Pimelea spectabilis, Eriostemon buxifolius. *Pelargoniums*, 1, Dr. Kay, for May's Hermit, May's Bacchus, Erectum, and Wizard. *Ericas*, 1, J. M. Yeeles, Esq., for E. suaveolens, E. epistoma, and E. echiiflora. *Single specimen*, 1, J. M. Yeeles, Esq., for E. Templeana. *Hardy Plants*, 1, J. Jarrett, Esq., for Rhododendron roseum, Kalmia latifolia, and Pæonia officinalis. *Pelargoniums*, 1, Mr. G. Shaw, for Nymph, Jehu, King, Cyrus, Clarissa, Bridegroom, Sultan, Sylph, Jewess, Acme of Perfection, Coronation, Britannia, Comte de Paris, Queen of the Fairies, Gipsy, and Lilia. *Cacti*, 1, Mr. G. Shaw, for C. speciosissimus, C. Ackermannii major, C. speciosus, C. Ackermannii minor, C. Millerii, and C. speciosus coccineus. *Amaryllises*, 1, Mr. G. Shaw, for A. vittata, Johnsonii, Ackermannii, Braziliensis, and a Seedling. *Roses*, 1, Miss Bayly, for Devoniensis, Madame Laffay, Yellow Noisette, Yellow China, Queen of Bourbons, Princess Augusta, White Moss, Red Moss, Belle Henriette, Odorata, and Beaugere; 2, J. M. Yeeles, Esq., for Prince Albert, Madame Laffay, Devoniensis, Charles Duval, Banksiæ, and Boule de Nanteuil. *Cinerarias*, 1, Miss Bayly, for Lavingtoniensis, Eclipse, and 2 Seedlings. *Ornamental Plants*, 1, Mr. G. Shaw, for Azalea indica alba, A. Smithii, A. pulcherrima, A. Phœnicea, Yellow China Rose, Fuchsia Curtisii, F. Moneypennii, Amaryllis Braziliensis, A. Johnsonii, Erica ampullacea, Calceolaria splendida, C. tricolor, some Cactus, Hovea Celsi, Vinca rosea, V. alba, Lantana mutabilis, Gloxinia speciosa, G. Youngii, Pelargoniums, Gipsy, Jehu, Victory, Bridegroom, Grand Duke, Zenobia, Jesse, Cineraria unique, Lavingtoniensis, and Carmina. Extra Prizes.—*Greenhouse Plants*, 1, J. M. Yeeles, Esq., for Azalea Smithii coccinea, A. indica alba, Corræa speciosa major, Cytisus canariensis. *Pelargoniums*, 1, J. M. Yeeles, Esq., for Coronation, Nymph, Victory. Florists' Flowers and Cut Flowers.—Class II.—Amateurs.—*Polyanthuses*, 1, Miss Bayly, for Buck's George the IV., Pearson's Alexander, Princess Royal, Nicholson's King. *Pansies*, 1, Miss Bayly, for Prince of Wales, Eclipse, Curion, Bathonia, Sylph, Earl of Clarendon, Duke of Beaufort, Dorothy, and a Seedling; 2, Mr. G. D. Fisher, for Limpley Stoke, Princess Royal, Earl of Clarendon, Jehu, Regulator, Bellissima, Duke of Richmond, Phœbe, Silverlock's Prince Albert, Sulphurea elegans, &c. Extra Prizes.—*Auriculas*, R. Godfrey, Esq., for Wood's Lord Lascelles, Hughes's Pillar of Beauty, and Warrow's Union. *Pansies*, J. M. Yeeles, Esq., for Delight, Virgil, Curion, Prince of Wales, Unrivalled Yellow, Dorothy, Duke of Beaufort, Mary Anne, Trevarne, Laura, Beauty of the Village, and Queen of Beauties.

North British Professional Gardeners' Society.—This was the first meeting for this season. All the articles that were brought forward for competition have rarely, if ever, been surpassed at any former meeting. The following prizes were awarded:—*Auriculas:* Laurie's Hertfordshire Hero, Moon's Violet, Waterhouse's Conqueror of Europe, Leigh's Talavera, Taylor's Glory, and Lord of Hulmshire; Mr. J. Young, gr. to T. Oliver, Esq. *Best three Selfs:* Smith's Incomparable, Gordon's Stateholder, and Martin's Mayfield; Mr. J. Young. *Polyanthuses*: George IV., Collier's Prince Royal, and Steed's Telegraph; Mr. Alex. Forester, gr. to Capt. Falconer. *Camellias*: Imbricata, Donkelærii and speciosa: Mr. Robert Watson, gr. to D. Anderson, Esq. *Cinerarias*:—Macnabiana, a seedling, and ovata, Mr. J. Addison, gr. to the Earl of Wemyss. *Epacrises*: Grandiflora, and two seedlings, Mr. D. Fowlis. *Pears*: Chaumontel and Beurré Rance, Mr. J. Goodall. *Dessert Apples*: Ribston Pippin, Nonpareil, Loan's Pearmain, Mr. J. Goodall. *Baking Apples*: Yorkshire Green, Fal's Ribston, Mr. J. Goodall. *Asparagus*: Mr. J. Goodall. The following plants were sent for exhibition:—A new Cineraria called Warristoniana, from Messrs. Carstairs, Kelly, and Co.

Reviews.

The Art of Building and Managing Hothouses, &c. (Art de Construire et de Gouverner les Serres). By M. Neumann. Paris, 1844. Long quarto.

M. Neumann is chief gardener in the *Jardin des Plantes* at Paris, and has the management of the houses there. He is a clever man, and acquainted with English establishments. In this work he describes the manner in which hothouses, greenhouses, forcing-houses, conservatories, and all the varieties of glass structures, are built and managed in France; and he illustrates his subject with 21 plates of plans, elevations, sections, &c.,

among which are views of the Conservatory at Chatsworth.

It did not strike us, when we knew Paris five-and-twenty years ago, that we had much to learn from our clever neighbours in this department of gardening; nor does the perusal of M. Neumann's work alter that opinion, or the reports made to us by our correspondents. *Good* gardening under glass is essentially English; and so, we suspect, it is likely to remain. The Dutch, indeed, beat us hollow in forcing Lettuces and winter vegetables; nor is it much to our credit that they do so; and the private collections of the Continent contain more species than those of England; but, as a general fact, nobody can doubt that the Horticulture of artificial climate is better understood in this country than elsewhere. In this sense M. Neumann's work is of more importance to his own countrymen than to us. It is, however, interesting to examine the views respecting cultivation, of so well informed a man as the author; and, therefore, we shall make a few extracts from his work.

What M. Neumann says about repotting, affords a clue to the whole of his views of what hothouse cultivation is to do. He considers the process necessary in most cases every year, not for the purpose of renewing the soil, but to keep the plants within bounds; and accordingly he directs the roots and branches to be annually reduced. By this means plants will doubtless be kept small, and a crowd of specimens may be preserved in a hothouse; but it is the practice of mere botanic gardeners, and is at variance with good gardening. He directs the process of re-potting to take place after winter, at the very moment when plants are beginning to push; and particularly insists upon the necessity of preserving a due balance between the roots and the head. The strongest plants, he observes, are liable to die if the roots, reduced to half their former quantity, are left to support an undiminished head. The plants which bear root-pruning worst he finds to be Clusias, Chrysophyllums, Lauraceous plants, Cloves, and Nutmegs.

In speaking of watering plants, we find no allusion to the use of evaporating-pans; but great importance is very properly attached to using the water in a warm state. We also find the following fact, which may be new to some:—"It has frequently happened that gardeners, having washed in a tank of water their pruning-knife and hands, after having been dressing certain poisonous plants, the fish in the tanks have immediately died, and the water has speedily become putrid. This has been more especially observed with the Hippomane biglandulosa, the Manchineel, the Tanghin, Sapium laurocerasus, and Comocladia dentata. These plants are as dangerous to man as to fish. Gardeners frequently, after merely rubbing the leaves of Comocladia between the fingers, have had their whole body swelled the next day, and been struck with temporary blindness. The juice of such plants is excessively dangerous; the slightest scratch with a pruning-knife smeared with it may be as fatal as the wound of a poisoned arrow. One of the old gardeners at Malmaison lost an eye by the Sapium."

The water of storms and thundershowers is preferred to all others—an additional reason for catching what falls on the roofs of garden buildings; next comes snow-water; then the water of rivers and running streams; the worst is well-water.

M. Neumann is of opinion that pots should never be plunged, but should trust for the necessary warmth to the air that surrounds them, instead of receiving it from the soil heated by artificial means. He insists strongly (p. 18) upon the advantage of this practice, for reasons which to our mind are singularly inconclusive. But our narrow space compels us to defer the consideration of that most important question.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

BROMHEADIA PALUSTRIS Marsh Bromheadia. (*Stove Epiphyte.*) Orchidaceæ. Gynandria Monandria.—"When Mr. Finlayson was in the Malay Archipelago, he found a curious Orchidaceous plant at Sincapore, with the habit of Epidendrum elongatum; and from specimens of it, almost destroyed by insects, which I examined some years since in Dr. Wallich's herbarium, I referred it with great doubt to Grammatophyllum, under the name of G.? Finlaysonianum, (Gen. and Sp. Orch. t. 173.) This plant has flowered at Penllergare, in South Wales, with J. D. Llewelyn, Esq., who received it from Cuming, with the memorandum that it had been 'dug out of a bog in Sumatra.' Having now had the advantage of examining a perfect specimen in flower, I find that although nearly allied to Grammatophyllum, it is in fact very distinct. I therefore avail myself of the opportunity of adding to the list of genera the name of Sir Edward Ffrench Bromhead, Bart., F.R.S., whose investigations of the natural affinities of plants are well known to systematical Botanists." In appearance the plant has the aspect of Epidendrum elongatum, as has been already stated; and like it has the whole of the upper part of the stem provided with closely pressed distant sheaths, instead of leaves, on which the spike of flowers is arranged. The latter is very rigid, between two and three inches long, regularly zigzag, with a short hard tooth-like bract at each bend, so that the spike without the flowers resembles a coarsely-toothed narrow double-edged saw. The flowers are about an inch long, white, and rather drooping, spreading quite open. The labellum, in which alone any colour resides, is straw-coloured on the middle lobe, and violet at the tips of the lateral lobes; along the middle, as far as the separation of the lobes, it is convex and covered with purple down; while the disk of the middle lobe is broken up into yellow granulations.—*Botanical Register.*

ERIA FLORIBUNDA. Many-flowered Eria. (*Stove Epiphyte.*) Orchidaceæ. Gynandria Monandria.—Although the flowers of this plant cannot boast of large size and rich colours, they are by no means destitute of beauty. Arranged as they are in long drooping racemes, glassy in texture, and delicately touched with crimson, they are among the prettiest of the smaller kinds. It is a native of Sincapore, whence it has been received by Messrs. Loddiges. Along with E. polycera, bipunctata, profusa, and some others, it forms a small group of species, which are very different in habit from such plants as E. pannea, armeniaca, &c. It is a stove plant, and succeeds best when potted in turfy peat, mixed with a few potsherds. During the summer a liberal supply of water should be given, and the house be kept as moist as possible. In sunny weather the plant will be much benefited if slightly shaded, for although it enjoys a high temperature, yet its leaves will become pale and contracte if too much exposed to the rays of the sun. In winter very little water is required, especially if the house can be filled with steam once a day, which is always preferable to syringing.—*Botanical Register.*

GARDEN MEMORANDA.

Pendarves near Truro.—There is now in flower here a most beautiful plant of Clianthus puniceus, occupying a wall 35 ft. long, and 12 ft. high. It is one sheet of crimson, and forms as magnificent an object as can well be imagined. This specimen was out in the winter of 1837-8, when it was much damaged by frost, and by mice, who made a feast upon the branches.

Mr. Groom's, Clapham Rise.—The magnificent collection of Tulips at this establishment is now in great perfection; the protected bed, containing about 2000 bulbs, makes a splendid show, and seldom have they been seen in finer condition. In point of colour they are very superior, and there is less flushing or running in this respect than we have been accustomed to see in so large a bed. Among the Roses—Rosa blanca, we noticed in unusually fine condition; Aglaia, a lovely flower; and Cerise a belle forme, good throughout the bed. This is the case also with a superior strain of Triumph Royale, Lady Crewe, a very delicate flower, with several other Roses of Mr. Groom's breaking, such as the Duchess of Sutherland, Lady Douro, the Countess of Blessington, &c. In Bybloemens, Victoria Regina appears to be the most perfect, the cup is so beautiful in form, and the marking so precise and uniform. The Duchess of Buccleugh, Ambassadeur de Hollande, Lawrence's Friend, Bijou d'Amateurs, Perle Blanche, and Michael Angelo, we noticed as being very superior in this class. Platoff, the Duke of Norfolk, and Duke of Devonshire, are three fine bizarres, and Everard, a high-coloured and bright flower, forms a very desirable variety. Pompe Funèbre is grand; Polyphemus is very fine throughout, and Nourri Effendi, with its bright ground and intensely dark marking, is particularly striking; a single visit is not sufficient for this bed: the flowers require stricter examination than can be given at one time. The Pelargoniums are looking well, and the Japan Lilies are in vigorous health and condition.

Mr. Dickson's, Acre Lane.—This bed, though small, contains very choice varieties. They are well grown, and bloomed in very fine condition; the cups are larger than usual, but the ground-colour is fine and clear, and the markings very clean and decided. One of the first flowers that attracted our attention was a fine bloom of Pandora, with its perfect cup and rich flower; this is still a very scarce variety. It is most amusing to visit collections of this elegant flower; independent of the pleasure derived from viewing such beautiful objects, every bed contains beauties of its own, and varieties that are poorly bloomed at one place, in another are seen in perfection. Among the choice Roses, Catalani, Claudiana, Andromache, and Mason's Matilda and Rose Charlotte, a superior strain of Triumph Royale, were particularly fine. Holmes' King, byb., is always first-rate in this bed, full of colour: this is a most desirable flower, being constant and perfectly distinct. Violet Quarto is also a very superior variety. The Bizarres are very choice: that noble variety, the Duke of Devonshire, broke by Mr. Dickson, is a grand specimen, large and fine. Glencoe Charbonier Noir and Platoff are attractive varieties. These are a few of the choice sorts particularly worthy attention. The bed is altogether unusually fine; and its condition reflects great credit upon its owner.

Miscellaneous.

The Cuckoo.—To no bird is the gift of prophecy more commonly attributed than to the Cuckoo, whose loud measured voice resounds in the woods just clad with fresh verdure. The old German saying, "Wann der *gauch guket*," denotes the beginning of the spring,* just as, according to Hesiod, the song of the Cuckoo announces the time of the spring rains. Two old poems describe the contention of Spring and Winter about the Cuckoo, and the lament of the herdsmen for him; the Spring praises, slow Winter—*tarda hiems*—reproaches the bird; the herdsmen represent him as taken away or drowned: the line is remarkable:—

Tempus adest veris, cuculus modo rumpe soporem.†

He announces by his song the loveliest season of the year, but it is not stated in these poems that he predicts to man. The Anglo-Saxon Codex Exoniensis, 146, 27, lately published by Mr. Thorpe, ascribes likewise to this bird the announcing of the year:—

geacas gear budon; cuculi annum nuntiavere.

The popular belief still exists that whoever hears the cry of the Cuckoo for the first time in the spring, may ask him how many more years he has to live. In Switzerland the children cry, "*Gugger*, wie lang lebi no?" In Lower Saxony,

"Kukuk vam häven
Wo lange sall ik leven?"

and then they listen and count; as many times as the bird cries after it is questioned, so many years has he who asks the question to live. In other places the saying is as follows:—

Kukuk, beckenknecht,	Cuckoo, baker-boy,
Sag mir recht,	Tell me true,
Wie viel jahr ich leben soll?	How many years shall I live?

The bird is said to be a bewitched baker or miller-boy, and thus has pale or meal-coloured feathers. In a dear season he robbed poor folks of their dough, and when God blessed the dough in the oven, drew it out, plucked some off, and every time cried out as he did so, "Gukuk!" (Look, look!) God therefore punished him, and turned him into a thievish bird, who continually repeats this cry. This legend, which is of great antiquity, and resembles that of the Woodpecker, may at an earlier period have been otherwise told; and connected with it may have been the notion that the cry of the Cuckoo, if heard after St. John's Day, betokens scarcity. In Sweden he prophecies to unmarried lasses how many years they shall remain single.

Gök, Gök, sitt på quist, &c.
Cuckoo, Cuckoo, that sits on a bough, &c.

If he cries oftener than ten times they say that he sits upon a silly bough, and give no heed to his prophecies. Much depends upon the direction in which the Cuckoo is first heard; if from the north (that is the unlucky side) you will have mourning during the year: from the east or west his cry portends good fortune. In Gœthe's "Fruhlingsorakel" the prophetic bird announces to a pair of lovers their approaching marriage and the number of children. It is remarkable enough that our poets of the 13th century do not mention the cuckoo as prophesying: the thing was doubtless commonly known, for we find in Renner, 11,340,

Daz weiz der gouch, der im für wâr
Hât gegutzet hundert jâr.

And we have a story related by the abbot Theobald of a certain novice who, assuring himself of living 22 years longer, from having heard the Cuckoo repeat its cry just so many times, concluded that it was needless for him to pass so long a period in mortification, and resolved to return and lead a jolly life for 20 years, thinking the remaining two quite enough for penitence. From the regularity of the time of his appearance, the Cuckoo is probably the bird designated *zîtvogel* in an old proverb, in accordance with the passage of Pliny, "Cantus alitis *temporarii* quem cuculum vocant." It is said that he never cries before the 3d of April, and never after the festival of St. John. But he cannot cry before he has devoured a bird's egg. If you have money in your purse when he first cries, all will go well during the year; and if you were fasting, you will be hungry the whole year. When the Cuckoo has eaten his fill of Cherries three times he ceases to sing. It portends misfortune to the Servian haiduken when the kukavitza appears early and comes out of the blackwood, but good luck when his cry comes from the greenwood. The froth in the meadows caused by the Cicada spumaria is called Cuckoo spittle; *Germ.* Kukkukspeichel; *Swiss*, Guggerspeu; *Dan.* Giögespyt; otherwise Hexenspeichel, Witches-spit; *Norw.* Troldkiäringspye; thus connecting the bird with supernatural beings. The names of some plants confirm its mythic character: Oxalis acetosella; *Old German*, Gouches-ampfera; *Swiss*, Guggersauer; *Anglo-Saxon*, Geaces-sure; *Dan.* Giogemad, Giogesyre. It was believed that the bird liked to eat these: *Modern German*, Kukkuksbrot; *Fr.* Pain de Coucou, Panis cuculi. Cuckoo-flower, Lychnis Flos-cuculi, *Germ.* Kukkuksblume. The Slavonians do not attribute anything bad or devilish to this bird, which they always represent as a female. Zezhulice, sitting on an Oak, bewails the transitoriness of spring. The Servian kukavitza was a maiden who long bewailed her brother's death, until she was changed into the bird, "Sinja kukavitza" (the gray): so also in Russian songs it is a bird of mourning and melancholy; and Russian traditions speak of her as a young maiden changed by an enchantress.—*The Annals and Magazine of Natural History.*

Chemistry of Cultivation. By Professor Liebig. [Continued from p. 247.]—The quantity of aliments of plants contained in the atmosphere is limited; but it should be quite sufficient for covering the whole surface of the earth with a rich vegetation. Let us consider, that under the tropics, and in the countries of the earth where the most general conditions of fertility—moisture, an appropriate soil, light and an elevated temperature—are united, that in these places vegetation is scarcely limited by space, that when the soil is inefficient, the plant, dying, itself with its bark and branches become a part of the soil. It is clear that the plants of these countries cannot be deficient in atmospheric aliment; neither are our cultivated plants deficient. It is the continual motion of the atmosphere that furnishes to all plants an equal quantity of the aeriform aliments necessary to their development. The air at the tropics does not contain more than the air at the torrid zones; and yet, what a difference is shown in the power of the production of equal surfaces of land in these different countries! All plants of the tropical regions, the wax and oils, palms and the sugar cane, contain, compared with our cultivated plants, only a small quantity of the principles of the blood, properly so called, necessary for the nourishment of the animal. The tubercles of the Chili Potato, which resembles a high shrub, gathered from a whole acre of land, would scarcely suffice for one day for the sustenance of an Irish family (Darwin). The plants which serve for nourishment, and which form the object of culture, are only intermedia for the production of these principles of the blood. In the absence of the elements which the soils should furnish for their production, wood, sugar, and starch, may, perhaps, be formed in the plant, but it is not the same with the principles of the blood. If we wish to produce more of them on a given

* Looking forward to the return of fine weather in spring, the Norfolk people say, "When the Cuckoo has picked up the dirt."—R. T.

† Both poems are ascribed to Bede in Dornavii Amphitheatrum.

surface, than the plant in the free, natural, normal state, on this surface, can derive from the atmosphere, or receive from the soil, an artificial atmosphere must be created; the principles which are deficient must be added to the soil. The nourishment which should be furnished to different plants, in a given time, in order to allow of free and uninterrupted development, is very unequal. On arid sand, on a pure calcareous soil, and on naked rocks, but few kinds of vegetables grow; these are only vivacious vegetables; only very small quantities of mineral substances are required for their slow growth, which the soil, sterile for other kinds of plants, may still furnish to them in sufficient quantity: annual plants, especially those of summer, grow and attain their complete development in a proportionally short time; they do not thrive on a soil which is poor in the mineral substances necessary to their development. In order to arrive at a maximum of size, in the short period assigned to their life, the nourishment contained in the atmosphere is not sufficient. In order to attain the objects of culture, it is necessary to create for them, in the very soil, an artificial atmosphere of carbonic acid and ammonia. This excess of nourishment, which is wanting to the leaves, must be furnished to the organs contained in the soil, which correspond to them. But ammonia and carbonic acid are not sufficient for producing a principle of the plant, an alimentary substance for the animal. The formation of albumen is not possible without the alkalies, nor can vegetable fibrin and casein be produced without phosphoric acid and earthy salts. We know that the phosphoric acid of the phosphate of lime, which is separated in great quantity under the excrementitial form in the barks of ligneous plants, is indispensable to our cereal and leguminous plants for the formation of their seeds. What a difference between summer plants and evergreens, fatty plants, Mosses, trees with acicular leaves, and the Ferns! Summer and winter these latter plants assimilate every moment of the day carbon, by means of their leaves, by the absorption of carbonic acid, which the sterile soil cannot furnish to them. Their coriaceous or fleshy leaves retain the water absorbed with great force, and lose by evaporation very little of it compared with other plants. How small, indeed, is the quantity of mineral substances which they remove from the ground in the whole course of the year, during the almost uninterrupted duration of their growth, if we compare it with the quantity which a crop of Wheat, of equal weight, for example, takes from the soil in three months! From the foregoing it results that the advantages of appropriations are based on the fact that cultivated plants remove from the soil unequal quantities of certain aliments. In a fertile soil the plants should find all the inorganic principles indispensable to their development, in sufficient quantity, and in a state which allows of their being absorbed by the plant. A field prepared by art contains a certain amount of these principles, as well as of the vegetable substances in putrefaction and ammoniacal salts. We make succeed to a plant containing potassa (Turnips and Potatoes), a plant containing silica, and to the latter a plant containing lime. All these plants require alkalies and phosphates: a plant containing potassa requires the greatest quantity of the former, and the smallest quantity of the latter. The plant containing silica requires, with the soluble silicic acid which the plant containing potassa leaves, a considerable quantity of phosphates. The plant containing lime, which follows, (Peas, Clover, &c.,) may so exhaust the soil of this important principle, that there does not remain more of it than is sufficient for permitting the formation of the seed of a crop of Oats or Rye. The number of the crops obtained depends on the quantity of alkaline silicates and phosphates, or of the calcareous and magnesian salts which are found in them. The provision of these salts may suffice for two crops of a plant containing potassa, or lime, for three or more crops of a plant containing silica, and even for five or seven crops; but, after this time, all the mineral substances which we have taken from the soil, under the form of fruit, stems, leaves, and straw, must have been removed: the equilibrium must be re-established, in order that the land may recover its primitive fertility. This is effected by *manure*. It may be admitted that—in the roots and the stubble of cereal plants, in the fallen leaves of ligneous plants—the soil recovers as much carbon as it received at the commencement of vegetation, under the form of carbonic acid, produced by the destruction of humus. The stalks and leaves of Potatoes, and the roots of Clover, remain in the ground. These remains putrefy, and are destroyed during the winter, and the young plant and the seed find in them a natural source of carbonic acid. The soil is not exhausted of humus by these plants. Finally, it may be concluded from theoretical reasons, that the soil receives from plants, during their life, quite as much, or even more, of matters rich in carbon than it furnishes to them; that an act of excretion, which is operated at the surface of the fibres of the roots, enriches it with substances which putrefaction, during the winter, again converts into humus. The existence of an act of secretion and excretion has been maintained by some physiologists, and denied by others, so that at present the opinions on this point are divided. No one doubts, however, that the oxygen which separates from the leaves and green parts, is an excrement. The vital activity of the plant assimilates in its organs the carbon of the carbonic acid, the hydrogen of the water, whilst the unassimilated oxygen is separated. We have in flowers volatile oils, combinations rich in carbon and hydrogen, which have, likewise, ceased to belong to other vital acts. We see exude from the bark, resins, balsams, and gum; from the leaves, and from their hair sugar and mucilaginous matters. On the surface of the barks, roots, and all parts of plants which are not green, oxygen is not separated. We observed then, on the contrary, the separation of substances rich in carbon which, produced in the vital act of the plant, have undergone no alteration. If we compare, for example, the bark of Fir, of Pines, of the Beech, of Oak, of Hazel-tree, and wood, we find essential differences in their properties and composition. Whilst wood, properly so called, leaves only ½ to 2 per cent. of ash, the bark of the Oak, the Fir, the Willow, and the Beech, gives 6·10, and even 15 per cent.; the ash of the wood and that of the bark have a very different composition. The inorganic principles of the bark are evidently substances which the living organism has rejected. A similar origin should be admitted for the organic principles of the bark. That of cork contains nearly half its weight of fatty substances or analogous matters, which we find, but in smaller proportion, in the barks of the Fir and Pine. The solid principle of these barks, insoluble in alcohol or ether, is perfectly different from the substance of wood. The barks of Fir and Oak almost completely dissolve in a solution of potassa, forming a liquor of a deep brown colour, from which the acids precipitate a matter which has the greatest resemblance to the substance called ulmic acid. Wood is not attacked by a solution of potassa. These barks are true excrementitial substances, since they arise from the living plant, and no longer take any part in its vital functions. They may be removed from the plant without putting its existence in danger. It is known that most of the plantains are annually deprived of their bark. Taking, therefore, this fact in its true signification, it is evident that there are formed in this ligneous plant, by aid of certain combinations produced in its vital act, substances which, not having to undergo any further change, are eliminated. We have every reason to believe that this elimination takes place all over the surface: we observe it not only on the trunk, but also on the smaller branches: and we should conclude that this act of excretion is operated also in the roots. We see that rain-water, in which a branch of willow vegetates, is gradually coloured of a deep brown. We observe the same phenomenon with bulbous plants (Hyacinths), which are grown in pure water. It cannot, therefore, be denied that there is an elimination of excrementitial substances in plants, although it may not take place to the same extent in all. The enriching of the soil with organic substances by the culture of perennial plants, such as Sainfoin and Clover, which are distinguished by the abundant ramifications of their roots, as well as by the great development of their leaves, is considered as a positive fact by most agricultural writers, and which is perhaps explained in the preceding. We cannot operate the formation of ammonia on cultivated lands, but indeed an artificial production of humus. It is the latter which should be considered as one of the objects of appropriations, and as a second cause of their advantages. It is by sowing a field with Clover, Rye, Lupins, Buckwheat, &c., and by incorporating in the ground plants ready to flower, by tillage, which we create in consequence of an act of destruction of the new-sown seed and of the young plant which is developed, a maximum of nourishment, an atmosphere of carbonic acid: all the nitrogen which the first plant took from the air—all the alkalies and phosphates which it received from the soil, serve to render more beautiful and more luxuriant the vegetation of the plant which follows.—*From the Chemist.*

CALENDAR OF OPERATIONS

For the ensuing Week.

I.—HOTHOUSE, CONSERVATORIES, &c.

The usual routine of watering and keeping the plants clean and properly trained, is all that is necessary here for some time. Some few plants may want shifting now and then, and all the young stock must be shifted by degrees, as they advance; but no precise time can be pointed out for this work; the whole depends on the state of the plants, and means of the cultivator.

Conservatory.—Keep down the temperature here by all possible means, in order to prolong the flowering of the plants; and as the syringe would soon injure the appearance of plants in flower, the rose watering-pot must take the place of it; flood all spare parts in the house morning and evening. Conservatories with fixed roofs for growing Stove and Half-stove Climbers, in addition to the usual collection, are beginning to come into fashion rapidly, and I am promised some account of how far they shall be approved of before the end of the season.

Greenhouse.—Continue to encourage these plants to make rapid growth during all this month, and keep the atmosphere always moist at night during this stage. As few plants are allowed to flower in this house, where there is a conservatory, the syringe may be used freely in the afternoon of fine days. Training and regulating the growth of all pot-plants, as well as watering and killing insects, must be attended to while the plants are growing.

Forcing-Pits.—This is just the critical time when a little oversight may cause a good deal of murmuring next winter. Look over the lists of forcing-plants in the previous volumes, the very first opportunity you have, and consider how many you may want of those most esteemed by the family, always making allowance of 20 per cent. for failure among those forced in December. All the Roses you intend to force before Christmas, should be worked on the Boursault, or some variety of Noisette; but a number of Bourbon, Tea, and China Roses are better forced on their own roots. This is about the right time to get them from Nurseries. The great growers can always tell the best sorts for particular purposes.—*D. B.*

II.—FLOWER GARDEN AND SHRUBBERIES.

Out-door Department.

A correspondent writes, "Supposing the present parching weather should continue for a month or six weeks longer (as some prognosticate it will), how do you intend to act in relation to bedding out your Verbenas, &c.? Do you not think it would be better, as the ground is a little warm, and all danger of frost past, to plant out at once? as, though the plants will make but little progress towards covering the beds, it is probable that, if they are properly watered and mulched, they will make a little root, and will therefore be ready to rush into luxuriant growth as soon as rain falls." To this I answer, there cannot be any objection to planting out at once providing the following rules are observed: first, have the soil properly moistened, and in a free open state; secondly, keep the plants moist at all times; and, thirdly, afford them a little shade during bright sunshine, until we are surrounded by a more genial atmosphere. My own method of procedure will be as follows:—I shall draw the earth from the middle of the beds, so as to form an embankment round the sides, and then having filled this basin with water, shall proceed to turn the plants out as soon as the ground is in a fit state. After they are planted, I shall mulch the beds with short Grass, and shade the plants with branches of evergreens until they become established, and when we get rain, shall cover the Grass with the soil from the sides. In this manner I hope to counteract the parching effect of east winds, and to get the beds covered in pretty good time. This method of planting will be rather untidy for a time, but this we must put up with.

Rustic Baskets and Vases may now be filled with soil, which should be of a rather retentive nature, and the plants turned out,—placing a few branches round them, as adverted to above. Flowers of a drooping habit are the best suited for baskets, as Fuchsias and the like; and Calceolaria viscossima, with Anagallis cærulea grandiflora, depending round the sides of the basket will not be an unsightly object.

Reserve Garden.—Watch closely for insects on your young plants, which are making sad havoc at the present time; destroy them by either lime or soot, or drive them away by means of spirits of tar. Prepare a piece of rich light ground for Violets, and part and plant them out as soon as we get a shower.

Pits and Frames.—These structures will almost be done with for this spring's planting, but they must not be idle, as it is time to commence propagating for next year. Cuttings of dwarf Phloxes, Alyssum saxatile, Arabis, &c., must now be got in, and those who are very enthusiastic in flower gardening may try their hands at preparing such plants as Leschenaultia formosa, biloba nana, and Baxteri; Genista rhodopnea, Cytisus racemosus, canariensis, &c. for bedding out next season. They will root freely now, and will make strong plants by the autumn. I yet hope to see masses of our finest Chinese Azaleas, such as lateritia, variegata, and Gladstonesi, turned out for the spring decoration of the flower-garden.

Shrubberies.—Attend closely to the watering of newly-planted trees, and keep all neat and clean; but the mowing of Grass-lawns had better be dispensed with until we get rain. The Grass is burning very much in this neighbourhood.—*W. P. A.*

III.—FLORISTS' FLOWERS.

Tulips are now in full splendour; the hot weather is bringing them on with amazing rapidity. Where cultivators have not the convenience of an awning, the flowers ought to be covered with square boards, having a hole in one of the sides for the admission of the stick; after the flower has fully expanded, it will be advisable to tie it round with some worsted to prevent its full expansion again: under a canvass cover this precaution is not so necessary. The amateur will now make memoranda as he looks over his bed, marking their heights, state of bloom, their defects or good properties, bearing in mind that no other good qualities will compensate for foul or dirty cups. We are glad to find that the standard of perfection, or the properties which constitute a first-rate flower, are now much better understood, and we look forward to a proportionate improvement in collections. It is now a good time to cross-breed—mind to choose flowers with well-formed cups, and clear bottoms on both sides; just as the flower opens the anthers must be taken out; and when the flower expands, apply farina with a camel-hair brush to the stigma; never cross a Rose or Byb with a Bizarre, as the progeny would most probably be the greater part "tricolours," which are not so much esteemed as those of pure breed."

Auriculas—Are fading fast, the majority of collections being out of flower; where seed is not required, the heads may be cut off, not too low: put the plants in a shady situation, giving them the requisite attention of water and cleanliness; they are too often neglected after blooming-time. We once knew a very valuable collection ruined, by being placed under the drip of some trees for about six weeks. *Ranunculuses.*—The late dry weather has been very trying for these flowers: mind that the soil is close round the stems. If the beds have plenty of decayed cow-manure in their composition, and on a cool subsoil, they will do without watering. On the contrary, if the situation and other circumstances render watering imperative, let it be done in the evening, and avoid wetting the foliage as much as possible. *Carnations.*—Tie them up as fast as they require it, and as green-fly makes its appearance, dust Scotch snuff slightly over them, or brush them off with a large camel-hair brush; keep the pots free from weeds, which now spring fast. *Pinks.*—Tie up to sticks, and observe last week's directions.—*J. F. W.*

IV.—PINERIES, VINERIES, &c.

Pineries.—If the hot sunshine, accompanied by cold drying wind, which we have experienced for the last few days, continue, shade slightly all the Pines, excepting where Vines are grown in the houses. Sprinkle the paths frequently; this will keep the foliage in a green healthy state, and is better than that they should acquire a brown hue at this early period of the season. Many of the successions will now require re-potting; and to prevent the plants receiving any check, let this be done immediately that it is needed. Cease watering the plants in fruit as soon as there is the least indication of the fruit ripening, as from that time the soil or tan and the atmosphere will supply all the moisture needed.

Vinery.—If the outside borders have been kept covered with warm litter, as recommended from time to time in this Calendar, they will not require water, except in very dry situations. It will be proper, however, to examine them, and if water is found necessary, use liquid manure from the farmyard, or guano-water, in the proportion of 2 oz. of guano to a gallon of water. If the heat is decreasing, let the litter be turned, and fresh added if necessary. Continue to syringe in the afternoon, and shut up early at 90° or 95°, in Vineries where the fruit is swelling; but avoid wetting the Grapes after they begin to ripen. Give air early in the morning during bright sunshine, beginning with a little, and increasing it gradually as the sun approaches the meridian.

Peach-house.—If the Peaches now ripening have the leaves that shade them removed, and if plenty of back and front air is given during the day this fine weather, it will greatly improve both the flavour and the colour of the fruit. In the succession-houses but little fire will be required at night, if the sun-heat is properly economised by shutting up early. Tie in the advancing shoots frequently, and keep the foliage free from insects. Trees that are not vigorous should only be allowed to bear a light crop, while those which are growing too luxuriantly may be checked by leaving on a larger number of fruit, according to the strength of the tree.

Cherry-house.—Give more air, and keep a drier atmosphere, when the fruit is ripening. Give plenty of water to those trees now swelling their fruit, syringe well, and keep the foliage and fruit free from insects.

Fig-house.—So much air may now be given to Figs, that the ripening fruit will acquire a good flavour without keeping a very dry atmosphere during the night. Avoid, however, wetting the fruit after it begins to soften. Watering, as the plants may require it, and checking the increase of insects, must be duly attended to.

Strawberries.—If these are not kept well supplied with water this warm weather they will ripen prematurely, without attaining their full size. Look them over twice a day, watering only those that require it.

Melons.—Do not let the heat in the beds decline, but add fresh linings as required. If the plants require water, give it in the morning, that the vapour arising from the soil may pass off during the day. Avoid wetting the leaves, keep the shoots thin and regular, and if more than three Melons are swelling on a plant, reduce them to that number, taking care that those selected to remain are as near of a size as possible.—*G. F.*

V.—HARDY FRUIT AND KITCHEN-GARDEN.

Wall-trees.—Proceed with disbudding and removing young shoots from Peaches and Apricots. Where the fruit of the

former is too thick, a number may now be cut off; those of the latter will be useful as tarts. In disbudding, use a small sharp knife, as pinching the shoots off is apt to cause the wound to gum and canker. Where wood is wanted, pinch off the tops of strong shoots, as several good bearing shoots may be thus obtained. Where a shoot will be too strong and only one is wanted, cut it back so as to secure one good lateral. Where strong shoots appear where they are not wanted, or the tree is over-luxuriant, allow a number of them to run their full length, taking off the leaves from the under parts of the shoots as they advance. They will thus form channels for the extra sap, and will not shade unnecessarily the wood you intend for bearing. In removing shoots at this season, thin them gradually, so as ultimately to leave no more than can be exposed to the sun and air. Many will now be busy, with their snuff and *nux vomica* dusters, for banishing, if not exterminating, the green fly. It is certainly a good amusement for those who have the patience to like it. Commend me for dispatch, execution, and economy, to the fingers and thumb of an active man, Reid's patent syringe with the one nozzle for expelling the water, or a good garden engine.

Sow small salading Lettuces, and the different sorts of Broccoli for the main crop, not forgetting as the most useful the Early Purple Sprouting. Chappell's Cream and Bowle's Sulphur, &c., are fine sorts, when got true, and Knight's Protecting for earlier supply. I have never been able to procure the white Broccoli that appears in Covent Garden during the winter months; it must be much hardier than Grange's. Sow likewise Cabbage and Cauliflower for succession. *Routine.*—Tie up Lettuces, stop the shoots of the earliest Beans and Peas, prick out sweet herbs, Celery, &c.; harden off Tomatoes and Capsicums, attend to frames, water what you can, and stir the soil where you cannot.—*R. F.*

VI.—ARBORICULTURE.

Old Woods.—The timber of oak trees is acknowledged by most persons to be much better if the trees are peeled in the proper season. Where timber of good quality is particularly requested, it would be advisable to lop off the principal branches, peel the boils standing, and fell them in the following autumn or winter. This method is extensively practised in some districts. As the season for drying and securing the bark is so fine, no precautions on that head appear necessary.

Coppice.—The felling and peeling of coppice poles and other wood should be put forward with as much expedition as possible, as vegetation is rapid during this fine weather. As there is so much clear sunshine this season, it would be highly advisable to plaster over the cut part of the stools with fresh cowdung, as recommended last week.

Young Plantations.—The principal work in these, is to attend to all trees planted last season: water any that require it. Shade choice plants and keep them from waving by wind. Keep down and extirpate weeds, Fern, and other stuff, that would overgrow and injure young plants. Training and summer management of such trees as require it, should be attended to. Shorten previous years' shoots, and when those of this season are advanced in length and strength, use your finger and thumb in pinching off the ends, which increases the number of small branches, and prevents them from becoming too strong for the stem.

Nursery.—Attend assiduously to the seed-beds and transplanted young stuff. Water and shade them. Train young plants in rows similar to what I have just described in young plantations; but when the side branches are very numerous on young plants, thin out the strongest of them. The progress young plants make in nursery rows is astonishing, when they are judiciously trained during spring, summer, and even autumn. The summer and autumn training require only finger and thumb work: no knife should be used.—*W. B.*

State of the Weather near London for the week ending May 9, 1844, as observed at the Horticultural Garden, Chiswick.

Notices to Correspondents.

AQUATICS.—*W. T. Watkin.*—There is no difficulty about growing tender aquatic plants, if you keep the water warm, say from 70° to 75° in summer, and leave them nearly dry in winter. Nelumbium speciosum requires a water-heat of 84°. Cyperus Papyrus, Nelumbiums, Nymphæas, Limnocharis, Hydrocleys, Sagittarias, and Pontederias will furnish you with variety enough.

BOOKS.—*L. D.*—A large library, and long study of Botany, are required to gain a *full* knowledge of the classification of plants, according to the Natural System. Such knowledge as can be compressed into a single volume will be found in Lindley's "Natural System of Botany," a work full of references to other sources of information. You will probably find it to be what you want. Sweet's Catalogue is the best we have.——*A Syrian* had better get "Tenore's Corso delle Botaniche Lezioni" if he wishes for an Italian introduction to Botany.——*C. C.*—It is impossible to say what second-hand books are worth. You should inquire of a bookseller.

CAMELLIAS.—*T. A. N.*—We really cannot say why your Camellia, brought into the house from a frame, should, when it flowered and began to make its wood, upon being frequently sprinkled whilst growing with soft tepid water, have become sickly and yellow, except the old leaves, which remain fresh and green. It is clear that the water had nothing to do with it.

CARNATIONS.—*R. P. H.*—The luxuriance of your Carnations may be attributed to two separate causes. Your seed was sown too early, and your soil is too rich. It is best to sow the seed the latter end of May, so that your plants will not get so very strong before winter. It is not a necessary consequence that your flowers will be all single because they throw up many stems. Seedlings are always more vigorous than those that have been in cultivation for a length of time. —*W.*—*A Subscriber.*—It is not usual for Carnations and Pinks to bloom the first season. When the seed is sown early, flower stems are occasionally thrown up late in the autumn, and are destroyed by frost. The better system now to adopt will be, to plant them out as soon as they have six leaves (choosing a damp day for the operation) in beds, about 6 inches plant from plant. The soil ought to be poor, and, if possible, a north-east aspect, in order to counteract the luxuriance which early sowing has a tendency to promote. In these beds they may remain till next year, when they will bloom.—*W.*

CLIMBING PLANTS.—*W. T. W.*—You cannot have finer climbers than Clematis azurea grandiflora, Dolichos lignosus, Hardenbergia macrophylla and monophylla, Mandevilla suaveolens, Bignonia Pandorea, and Bugainvillea spectabilis; but you will probably not be able to flower the latter.

CONIFERÆ.—*Deodar.*—You may add to your collection of Coniferæ, Pinus taurica, nigricans, Laricio, Pinea, excelsa, and Cembra, Abies Cephalonica, and Morinda, which ought not to be expensive. The new kinds are necessarily very dear, because they are in few hands, and difficult to multiply. Why not apply to some respectable nurseryman for his price list, and take what you do not think too dear? We should be happy to advise you more particularly if we knew how.——*J. K.*—You may easily get a new leader to your Deodar to supply the place of the injured one, by tying up one of the best shoots near it. The Deodar grafts well upon the Larch. It may be done now, or in August. If done now, it will probably begin to grow before autumn; but if done in August, the scions may remain dormant until next spring. The scion and stock should be pared, so as to fit together accurately, and should be bound together firmly, without being crushed, by a piece of worsted thread.‡

FLOWERS.—*Lockhart and Co.*—Your Lupinus formosus is too like L. tomentosus to be worth preserving.

GARDEN-GROUND.—*Tyro.*—You will find some information about converting peat into garden-ground, at pp. 678 and 757 of vol. 1843, to which we must refer you. Three or four inches of clay will make a great difference in the condition of the soil, especially if you can add a good dressing of lime. As for manure, one never has too much of that in a garden. In turning over your soil, take care that the good upper soil is not mixed with the lower stratum of gravel; but be sure that there is not a hard pan below the peat. If there is, you must break that through, so as to secure a free communication for water both upwards and downwards.

GREENHOUSE.—*A Lady Gardener.*—Peaches are so excitable that it is impossible to keep greenhouse plants with them in winter without injuring the former, if fire-heat is used more than is necessary to exclude frost. But you do not want artificial heat beyond this, for Geraniums and such things. The same observations apply, though in a less degree, to a Vinery.——*Cavanensis.*—Your house is hardly wide enough for a conservatory. You will probably find it best suited for a greenhouse, especially if it has a lean-to roof, as we presume.‖

HARD WATER.—*Cambriensis.*—We cannot answer your question as to whether the constant use of carbonate of soda in tea-water will injure the constitution. It is possible, but your medical attendant alone can judge of that. It *may* be advantageous to the constitution.

HEATING.—*P. K.*—On no account use open tanks; you will be parboiled. A slate cover is better than one of tiles. It does not matter how the connection is made between the tanks and boiler, provided it is a sound joint, and the return-pipe goes into the lower part of the boiler, while the flow-pipe passes out from the upper.——*Machaon*—The Olmstead Stove is in principle a modification of Dr. Arnott's stove, but professing to expose a much larger heating surface to the air. —*J. S. Winton.*

HYACINTHS.—*Senex.*—You will find excellent practical directions for their management at p. 107, for 1842. There can be no doubt that it is better to prevent a Hyacinth flowering 2 years successively, if the bulbs are to remain very strong; but, by observing the directions given in the place above alluded to, they will flower well year after year without considerable deterioration. Gentianella prefers very stiff soil.

INSECTS.—*R. T.*—The brown Caterpillars, so destructive to the Cherry blossoms this spring, will change to small moths; the species we hope to determine by rearing them. *R.*——*M. W. K.*—If the ants come from under a wall pour down boiling water, and by repeating it they will soon disappear. If a phial containing some crumbs of bread and brown sugar be afterwards laid down near the spot, the stragglers will congregate in it, and may be easily destroyed. *R.*——*A Sussex Farmer.*—If you will send us specimens of the Hop-flea we will make it the subject of an Essay. Great numbers might be collected by a trap made of canvass, and strained on a frame, like an umbrella reversed, with an open space in the centre, and a slit on one side, to admit of its encircling the whole, or a large portion of the Hop-plant; the inside should be painted with tar, or some adhesive liquid, whenever it is to be used. Where this trap has been placed round the plant the poles should be struck, or the leaves may be brushed with a few birch twigs, when the insects will leap off and stick to the tar. It would be undoubtedly a tedious operation, but very effectual. *R.*——*C. T.*'s little pest belongs to the genus Podura of Linnæus. It is a species often complained of by Floriculturists, but little of its economy is known to naturalists. It delights in damp places, it is believed, and retires by day into the loose earth. *R.*——*K. O.*—We regret not being able to suggest any remedy beyond those we published last year, in describing the different scale insects, and all that we know relating to the Aphis lanigera has lately appeared in this journal, when we described and figured that insect. Surely by repeating the remedies already employed the Aphides must be extirpated. *R.*

MANURES.—*A. E. F.*—Bone-black consists of bone-earth coloured black by charcoal; when mixed with sulphuric acid, superphosphate of lime is obtained, which has a black colour from the charcoal. The value of such a superphosphate will of course depend on the quantity of superphosphate of lime which it contains; the more charcoal the less valuable will it be. Ordinary bone-black contains about 10 per cent. of charcoal.—*E.*——*A Lady.*—Guano is best used in a fluid state. Superphosphate of lime should be dug in; the others may be used in the way most convenient. They will probably be found useful to all plants except Coniferæ; but no fluid manure will act well on clay. Before manuring it, you should improve it by acting on its mechanical texture. First drain it well, then apply plenty of cinder-siftings and old plaster-rubbish, or the refuse mortar, and other calcareous matter, to be obtained where houses are pulled down. When these are well incorporated, and the land is in good tilth, fluid manures will act; till then, you had better employ stable manure, or such coarse materials as will loosen the soil as well as enrich it. If stable-manure is scarce, it would in that case be necessary to make a compost-heap of refuse-vegetables, leaves, cinders, charcoal-refuse, bits of half-rotten sticks, &c., and rendered stronger than natural by incorporating guano with them. Sand is a good substance to add, but the others are better. For immediate effect, the siftings of house-cinders, soaked with *any* strong manuring liquid, may best be used.

NAMES OF PLANTS.—*H. H.*—It will be labour in vain to search for solid distinctions between Prunus spinosa and insititia, which are doubtless the same species, notwithstanding that Botanists separate them. Their fruit offers the only sure difference.——*B. T. S.*—Listera ovata, or Tway-blade. *P. W. S.*—We do not attach importance to slight varieties; there is not a plant in which some deviation or another from its habitual condition may not be found occasionally.——*Tragyes.*—Dolichos purpureus.——*E. T. O.*—Either Epidendrum virgatum, or a new species.——*Etymology.*—We never heard of such a plant as Main de Lion.——*Z.*—Menyanthes trifoliata. It will not grow, except in water, and it likes plenty of it. It is quite common. You have sent no leaves with your Lathyrus.‡——*Chester.*—As we anticipated it is not a Banyan tree that the Chinese have dwarfed; but the Ficus nitida, a very different thing from the Banyan.——*A Devonian.* —Linum trigynum, and an Acacia near A. oxycedrus; but at present unknown to us. We will search for its name.—— *Jacques.*—A variety of Gesnera Douglassii.——*Puddy.*—Allium album.——*Stura.*—Eria floribunda.

ONIONS.—*Cumbriensis.*—The wet season—your ground being naturally loose, and rendered too much so by trenching and the application of stable manure—has probably prevented the formation of bulbs, *thick-necks*, or *scallions* only being the result.‖

PINK-SUPPORT.—*Youell and Co.*—Mr. Hatch's invention in its present form, appears to be admirably adapted for supporting Pinks and keeping them in form. It could no doubt be easily applied to Carnations and Picotees: the wire in this case would require to be firmly fastened to the stick.*

POLIANTHES TUBEROSA.—*A Reader.*—If the soil is damp and warm you need not water these until they begin to grow.‡

ROSES.—*T. A. N.*—You may syringe your Roses in the evening. Do not yet cut away the "sap buds" close to the buds that were inserted last year, but top them a little above the latter, leaving a few leaves to draw up the sap. When the buds become established, and fully able to support themselves, then that part of the stock above the buds may be deprived of leaves and used to tie the new shoots to till they harden.‡

THE STRAWBERRY.—*A.B.C.*—In taking runners for new plants, it is of no consequence whether you take them from plants in bloom, or from others.——*Cavanensis*—It is advisable to cut off the runners from Strawberry rows, composed of such free-growing sorts as Keen's Seedling, Old Pine, Downton, Elton, &c.; but with regard to those of shy growth, and of which the old plants are apt to die off in winter, it is best to follow the plan by which you state you obtained good crops of Myatt's Pine—that of allowing a sufficient number of the first runners to strike root, and remain to produce the crop in the following season.‖——*J. K.*—Water to the roots, not the flowers, is all that Strawberry plants want now in order to make their fruit swell. Manure will not now act on that, but will merely invigorate the plants against another flowering season. No sort of manure seems to come amiss to Strawberries, but they are particularly fond of bone fragments.

VINES.—*An Old Friend.*—If your gardener planted his Vines on the top of his border, the raising it to the level of the sill would have been an advantage rather than a disadvantage; but if he planted them in the usual way, and then heaped earth over the roots and stems till he brought the border up to the level of the sill, that would account for your Vines being uniformly barren, because of the coldness of the soil at a distance from the surface, and the great exclusion of air from the roots. It is possible, however, that we have misunderstood you; and if so, it would be as well to state the case very exactly, mentioning the way in which the drainage of the border was provided for, and how the border was made, when we will either advise you again, or print the statement, in the hope that it may catch the eye of some one acquainted with some other instance of the same sort. Roberts's book on the Vine is excellent of its kind.——*Cavanensis.*—Varieties for growing under the nine rafters of your greenhouse should be such as will bear with close pruning—5 Black Hamburgh, 1 Black Prince, 2 Royal Muscadine, 1 Sweetwater. Your other plants will not be much injured if you dress the Vines so as to extend but as little as possible under the glass. The border for the Vines need not be more than 6 feet wide at present, and 2½ feet deep. 6 feet more should be added to the width of the border as the roots extend. You may plant the Vines turned out of pots in the end of this month.‖

MISCELLANEOUS.—*Orchis.*—Both Orchis mascula, morio, and latifolia vary very much in the colour of their flowers, from white to deep purple.——*Cambriensis.*—If you will watch our Notices you will see that we do exactly what you wish, in a quiet way. The difficulty about giving questions as well as our answers lies in the want of space. "Bevan on the Honey-Bee" will probably answer your purpose best. Some day we will think about a glossary, but fear it will be much too long for a newspaper. Other answers elsewhere.—— *Simplex.*—We are really very *much* obliged to you; such things do not strike us as they strike others. There are, however, many tastes to consult. We shall keep an eye upon the points you mention; one of them is nearly brought to a close.——*J. Smythe.*—It is impossible to answer your question without seeing the excrescences you mention. Violets, like other plants, are subject to various organic deformities and changes.

SEEDLING FLORISTS' FLOWERS.

AURICULA.—*J. C.*—Your Self is a neatly-formed and prettily-shaded flower, and will do for the borders; the yellow paste excludes it from Show varieties.*——*J. H. V.*—Your collection of *Alpines* is extremely good; they are large and showy flowers, very varied in colour.*

CALCEOLARIAS.—*J. B.*—There is nothing in your seedling to distinguish it from a great many raised by other growers.*—— *T. C.*—No. 1 is pretty from its marking; 2, very common; 3, curiously and very prettily marked,—it is also an approach to a good form; they are all defective in the outline of the flower, being deeply indented at the bottom.*——*R. J.*—No. 1 is a pretty Self, and a well-formed flower; but your seedlings do not differ sufficiently from the varieties raised by other growers.*

CEREUS.—*C. J.*—"Flowers of a Cereus originated between speciosissimus and flagelliformis, the former species bearing the seed, and the plant also having its furrowed habits, with the pendulous growth of the male parent." The flowers of this hybrid are of a deep bright crimson, enriched in the inside by a beautiful tinge of blue; if a free bloomer, it will make a desirable variety in this class.*

CINERARIAS.—*J. B.*—Your best seedling, the *Fairy*, is of a rich colour, and a good size. *Village Maid*, *Aurora*, and *Gipsy* are small, and in colour they have all been anticipated by other growers.*

PANSIES.—*B.*—Your seedling is extremely pretty, but deficient both in form and substance.*——*R. B.*—Neither of your Pansies are worth preserving; they are small, common in colour, and poor in substance.*——*V. E.*—A large well-formed flower, of good substance, large purple eye, white ground, deep purple upper petals, with a broad belting of the same surrounding the lower ones; the belting breaks off rather too soon, but it is uniform in the three petals.*—— *H. B.*—None of the seedlings you have sent are good in form; generally they are too long and under-sized.*——*G. U.*—Your bloom was injured by being too much pressed. It appears to be of good form and substance, upper petals and broad belting of the deepest purple, with large eye of the same, nearly filling up the shield.*——*C. H.*—No. 1, white, with a fine dark eye; petals too much puckered at the edges; 2, a large flower, of good substance; three lower petals remarkably fine; the upper are rather large, and not disposed to lie flat; 3, a large, compact, and flat flower; the edges of the petals are too much serrated, and the ground colour wants uniformity; 4, a fine deep purple Self. These flowers are all large, and of good substance.*

ERRATA.—In "Insects," p. 275, line 34, for "larvæ" read "larva."——In "Notices to Correspondents," p. 264, under the head "Plants," by a mistake in the punctuation, a list of Aquatics was called Rock Plants. The full-point, instead of being placed after "plants," should be put before "for," and the sentence should be read, "For rock plants see p. 152, 1844."——In p. 261, line 20, under the head "Figs," by "Observer J—4," for "Lord Audley," read "Lord Eardley."

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.—The GENERAL MEETING will be held at the Society's House, No. 12, Hanover-square, London, on Wednesday the 22d of May, at Ten o'clock precisely (instead of 12 o'clock).

By Order of the Council,
JAMES HUDSON, Secretary.

London, May 3, 1844.

SOUTH HAMS AGRICULTURAL ASSOCIATION.—The Sixth ANNUAL MEETING and CATTLE-SHOW of the above Association will be held in the Barrack-Yard at Modbury, on WEDNESDAY, the 5th day of June, 1844. For List of Premiums, Regulations for Entry, Certificates, and other particulars, application is to be made (free of expense) to Mr. KELLY, the Secretary, at Modbury.—May 2, 1844.

ANY one having a BUDDING'S PATENT MOWING MACHINE to dispose of, second hand, but perfect, may hear of a Purchaser on applying to X, Post-Office, Kirkby Lonsdale.

The Agricultural Gazette.

SATURDAY, MAY 11, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, May 15 Agricultural Society of England.
THURSDAY, May 16 { Agricultural Imp. Soc. of Ireland. Highland and Agricultural Society.
WEDNESDAY, May 22 Agricultural Society of England.
THURSDAY, May 23 Agricultural Imp. Soc. of Ireland.
FARMERS' CLUBS—May 25 { Gloucester. Cardiff.

ERRATUM.—At p. 283 there is an important error in the account of "Experiments with Manures," on the estate of Mr. Aghonby. By some slip of the transcriber, the quantity of superphosphate of lime used per acre is stated to have been 1 *ton* 2 cwt. 20 lbs. The reader is requested to erase the words 1 *ton* The quantity employed was 2 cwt. 20 lbs.

We have great pleasure in directing the attention of our readers to the account in another page of what is believed to be the first public meeting held in England, for the special purpose of promoting AGRICULTURAL EDUCATION.

Last year, the importance of educating the Agricultural classes, and the importance more especially of giving farmers' sons an *Agricultural* education, was pressed upon the attention of the Cirencester Farmers' Club, at one of their monthly meetings, by Mr. R. J. Brown, of that town. A committee was on that occasion named for the purpose of carrying into effect resolutions approving of Mr. Brown's views. The members of this committee have since then been unremitting in the advocacy of their cause, and the public meeting held on the 29th ult. at Cirencester, was called by them in order that they might lay their plans before the Agriculturists of the district, and report the progress they had made in carrying them into execution. The resolutions which they suggested, proposed and seconded as they were by landowners and practical farmers, were carried all but unanimously in a full meeting of the Agriculturists of East Gloucestershi the Earl of Bathurst being in the chair. The heartiness and activity which seem to characterise their proceedings, augur well for the success of their plans. The first resolution is one which, were it entertained and adopted by every Farmers' Club in the kingdom, would, when worked out, be productive of great national good. It was moved by the Earl of Ducie, and seconded by Mr. Kearsey, a tenant-farmer, that it is expedient to provide an institution in which the rising generation of farmers may receive instruction at a moderate expense in those sciences, a knowledge of which is essential to successful cultivation; and that a farm form part of such institution.

This, when established, will be the first Agricultural College in England. It has long been the shame of our country that it possesses no Educational Institution for farmers, such as those which benefit almost every Continental state. There is an Agricultural school at Templemoyle, in Ireland, and there is a Professorship of Agriculture at Edinburgh, the chair of which is occupied by a practical farmer, but these are the only cases of the kind that we know of in Great Britain. If, however, the Cirencester farmers and landlords succeed in establishing, as they propose, their College on the Cotswold Hills, we may hope that their example will induce others to attempt the establishment of similar institutions in other districts. The success of this attempt at Cirencester—the first, it is believed, of the kind in English history—thus possesses national interest; and we do hope that Agriculturists of all classes in the country, whether lords or merely tenants of the land, will prove the reality of this interest by affording substantial assistance in furthering the object of it. Much assistance would be given by the mere expression of feelings on the matter. Let the Agricultural periodicals and newspapers of the day be filled with communications from all who feel interested in the subject of Agricultural Education. It is certainly the most important subject which can engage the attention of Agricultural writers—let it be that on which they most frequently and usefully wield their pens. An interest would thus be excited in the matter throughout the extensive and rapidly widening circle of Agricultural readers, and men would be prepared readily to follow the example so well set at Cirencester. Let a great effort be made to give the character of the British farmer as high a station intellectually as it already holds morally and physically. Were there, as there ought to be, a national sympathy with the promoters of the Agricultural Institution at Cirencester, no difficulty would be found in the way of expressing it usefully. We have no authority to say so, but we have no doubt that letters, whether merely of inquiry as to the nature and prospects of the proposed Institution, or expressive of the writer's anxiety to be of assistance to it, would meet with immediate attention if addressed to Mr. Brown, who, we believe, acts as Secretary to the Committee appointed at the late Public Meeting.

The value of the object at which the Cirencester Farmers' Club is aiming, is unquestionable. The following extract from the Report to which we have alluded, states the advantages which would follow the establishment of Schools of Agriculture:—

"So long as observation and experience were deemed all that was requisite to the successful pursuit of Agriculture, very little education, or knowledge of any sort, was deemed an essential preliminary. The son had only to follow the father about the farm for some three or four years, and to observe the mechanical operations for the preparation of the land for the various crops—the seasons of the year at which they were performed—and the feeding and general management of the live stock. This slight degree of information, together with the means of purchasing a sufficient stock, was then considered sufficient to constitute the farmer.

"But when the attention of men of science was turned in this direction, it became apparent that the then existing practice of Agriculture had no sound foundation to rest on;—that the composition of the various soils was unknown;—that the composition of the manures applied to them was unknown;—that the elements of the crops sought to be produced by the agency of the one and the other were unknown;—that the mode in which those crops assimilated the food provided for them, and therefore the state in which such crops would be placed under the most advantageous circumstances for the reception of such food, was unknown. In truth, that little more was known, than that on certain land, tilled in a given manner, so much grain and feed, in ordinary seasons, had, in fact, been produced, and therefore that under similar circumstances the same results might be anticipated.

"The principles and facts, however, promulgated from time to time by scientific men—the analyses published of various soils, manures, crops, &c.—the obvious advantages which attended the adoption of draining, upon more scientific principles—the introduction of implements of various kinds founded on more just conceptions of the laws of Mechanics, and the more effective application of power—all combined to convince teachable minds that much was yet to be learned by those who were interested in obtaining from the soil the utmost that it was capable of yielding, without deterioration, and at the lowest scale of expense.

"Hence arose an appetite for such knowledge, and a feeling of the necessity for some better medium of communication with one another on these subjects. The formation of Farmers' Clubs and the establishment of the Royal Agricultural Society of England may be traced to these causes.

"The result of the intercourse to which these institutions led, particularly from the occasional attendance of men of superior acquirements, was a general conviction that a great variety of knowledge was essential to the successful pursuit of Agriculture, which the existing race of farmers did not possess, and much of which they could not hope to attain for want of a suitable preparatory education.

"The Members of this Club, deeply impressed with this conviction, felt the importance of securing for the rising generation of farmers the advantage of early instruction in all those branches of knowledge, and that the time had arrived at which various circumstances conspired to indicate the necessity of rendering land as productive as possible, at the least expense of time and capital. This became the subject of discussion at many of their meetings On the necessity of an establishment of a School of Agriculture upon some plan or other, all were agreed. They found that institutions, having this object, existed in most parts of Europe—in France, in Italy, in Switzerland, in almost every province of Prussia, in Sweden, at Wirtemberg, Bavaria, Bohemia, and other parts of the Austrian dominions, and in Ireland.

"The Club eventually came to the resolution that the establishment of Agricultural Colleges, with example farms attached, in which young men having received an ordinary education should be instructed in those branches of knowledge which would best qualify them for the pursuit of Agriculture, would be the most desirable course; and they determined that an effort should be made to found a College in in their own district."

In another part of this day's Paper our readers will find Professor Johnston's Address to the Agricultural Chemistry Association of Scotland. Any of them, who with the individual dissentient at the late Cirencester meeting, may doubt the advantage of teaching farmers the sciences on which the success of their practice depends, should read that Address. The Association, through Professor Johnston, are doing a great deal of good among Scottish farmers. In Ayrshire and many other districts where lectures have been delivered, the excitement that has been produced is taking a right direction; text books of Agricultural Science are being published for use in the parish schools, and the young are being instructed in Agricultural Chemistry.

We hope and believe that the effort now making at Cirencester will succeed, and that the means of acquiring a knowledge of the practice and science of Agriculture will be placed before the young—not merely there, but, under the influence of example set there and in Scotland, in many other districts of our country.

Now that so great a DEMAND EXISTS FOR MANURES imported from other countries or manufactured in this, it is important that the farmer should be supplied with efficient means of insuring himself against that to which he is so liable—LOSS FROM ADULTERATION. We have, therefore, great pleasure in giving all possible prominence to the following communication from Mr. Lawes, in which a valuable suggestion is made on this subject:—

"In the article on Guano, taken from Professor Johnston's 'Lecture,' (page 270), there is a very important error, viz.:—that of considering the whole of the organic matter as ammonia; the quantity stated is from 32 to 65 per cent. The quantity of ammonia in the best guano varies from 10 to 15 per cent.; a great deal only contains 2 or 3. It is not unusual now for samples of guano to be offered for sale, the analysis of which is guaranteed in the following manner:—

Organic Matter and Ammoniacal Salts . .	60 per cent.
Water	10 ,, ,,

This is opening a great door for adulteration, as there is an abundance of organic matter in England worth little or nothing, which might be mixed with guano; and still such an analysis might hold good. I should recommend those who purchase guano to have an analysis from the agent, giving the per centage of real ammonia, quantity of phosphates, &c.; then let them take a small portion of it and inclose it in a sealed bottle; if after harvest they have reason to suppose, from the smallness of effect, that the guano has been adulterated, they could then have the sample in the bottle analysed by a good chemist, and recover damages from the agent who supplied it. The analysis of guano is exceedingly difficult, and can never be undertaken by the Agriculturist; and if all farmers refused to purchase the guano unless the quality was insured to them by a written analysis, they would stand a better chance of procuring a genuine article."

ON BLACK HORSEPONDS.—No. I.

IN these days of agricultural advancement, when our great Societies, by offering every sort of encouragement to improve the breed of our domestic animals, have called universal attention to the advantages of keeping them in the highest state of health, strength, and condition; when our Farmers' Clubs, by instigating extensive and endless experiments on the efficiency of foreign manures, and by drawing the most careful deductions of profit and loss from their application, have satisfied themselves of their value, and having enlisted the merchant into their service, have induced him at great cost to freight his ships with bones and nitrate of soda from South America, or guano from Africa or Peru, it is surprising to notice a common custom in many towns, by which not only the health, and sometimes the life of the most valuable animals, but also a manure as rich in quality and far greater in quantity than any which is imported, is year after year sacrificed carelessly, and without reflection. The slovenly and improvident habit of allowing the liquids from the farm-yard and from the dung-heaps to ooze out into the horsepond, where the cattle are compelled to drink, meets with frequent animadversion; but the extent of the evil is calculated by few. Observations on this subject in the *Agricultural Gazette* have lately called my attention more particularly to it. I have obtained from two of the many black horseponds within my reach samples of the usual beverage of the cattle of the farm, the occupier of which has this year lost three valuable cart-horses. The death of the first he attributed to having drunk too much water after a hard day's work; but the symptoms, as I am informed, were at least as strongly indicative of the quality as of the quantity of the water being the cause of death, and I am strongly inclined to think that no other more probable reason can be assigned in the case of the other two. I have since analysed these waters: in one case, in an imperial gallon there were 168 grains of dry solid contents, and in the other 108 grains of dry ingredients; both waters gave an alkaline re-action and were nauseous and saline to the taste, and emitted a disagreeable odour. The solid matter of an imperial gallon of each consisted of the following organic, earthy, and saline ingredients, stated in grains,—

Organic matters and salts of ammonia .	112	—No. 1.	44	—No. 2.
Soluble saline matter, consisting of sulphates and chlorides of potash and soda	32	„	34	„
Phosphates of lime and magnesia and carbonate of lime	24	„	30	„
	168	„	108	„

These substances, with a trifling exception, must have been obtained from the urine and fæces of the animals of the yard, and are, in fact, identically the same as those found in guano, which is the dung and urine of sea birds; and though they differ in proportions from guano, still the fertilising agents in the two are alike, with this exception, that the former contains its organic or animal matter in a fresher and more actively putrefying condition, and is just as much better as a manure as it is more dangerous to take as food.

Now, only let any farmer, who, every time that he passes the horsepond where his cattle drink has the misfortune to see his face reflected on a dark-brown slimy surface, imagine that it speaks to him thus:—"Why do you talk or think of guano? Here am I, full of the very essence of guano, yet totally neglected by you! In fact, I am actually as if you had expended so many pounds sterling in the purchase of guano, and had thrown it all into water, and stirred it well up so as to compound the richest of liquid manures; yet neglecting me as a manure for your Grain-crops or Grass-land, you allow me to be taken as food by your horses, for which, on the other hand, I am a slow consuming poison; you give me as drink—a black, disgusting, nauseous draught—for cows, from whose milk you make butter and cheese for sale, or for oxen, upon whose healthy flesh and rapid growth your profits depend. Your folly in thus neglecting me is self-evident and would be sufficiently obvious, though I should say nothing of the exhalations from my surface, which poison your family, your labourers, and yourself, which are now known to carry by the lungs into the system the seeds of most of the fevers and agues which human flesh is heir to, and which are also shrewdly suspected by many to be one of the causes of the inaccurately-so-called Epidemic, which has so often decimated the herds of this country, and from which you have probably suffered yourself."

Such an imaginary address on the part of the horsepond may, doubtless, appear overcharged and ridiculous to some; but, unfortunately, it is in many instances lamentably and literally true. If future space in these columns be allowed, I hope to make this apparent to many not yet aware of it, by showing in the first place, by a few simple calculations, the money value of the lost ingredients, measured, as nearly as may be, by the same ingredients contained in guano; and this, I think, will tend to open the eyes of the farmer to the great amount of valuable manure he in this way habitually throws away; and, secondly, by showing the positive mischief done to cattle by allowing such large quantities of deleterious and putrefying matter to find its way into the stomach of the living animal.—*Alfred Gyde, Painswick.*

AGRICULTURAL WEEDS.

ALLOW me to call the attention of farmers to the weeds which may occur in their crops during the present season. It is quite unnecessary to occupy valuable space with showing that the neglect of weeds is sure to be followed by a less plentiful crop, and that as the valuable produce is decreased so is the number of weeds sure to be increased during each successive season. Most weeds perfect their seeds before the crop is ripe, and thus, filling the soil with them, provide a plentiful supply of their progeny for many successive years; for, although the crop may be so changed as not to allow the seeds to vegetate in the two or three next seasons, still, when the rotation brings favourable culture on the land, then the seeds of the farmer's pests, which have lain dormant during the unfavourable interval, spring up in abundance. Thus it is clearly for the farmer's benefit to expend present money in clearing his fields of weeds, as by such an expenditure he will insure a long succession of better crops, and by producing a cleaner sample in the market, command a higher price for his grain. But the object had in view when commencing this communication was to remind the farmer that it often happens that the weeds which are amongst the most troublesome in his crops are brought on to the land with the seed. The seeds of many weeds are mixed with the seeds of Corn, Clover, Lucerne, Flax, and other crops, as sold by the importer (for it is chiefly foreign seeds that are in this dirty state, more care being usually taken with those of English growth), and it is strongly recommended that all such seeds should be removed by means of a sieve, for happily many of them are smaller than the valuable seeds with which they are mixed. Should, however, this not have been done, it is much to be wished that farmers would carefully note down the name of the person and the exact time when the seed was obtained, and also its origin, either English or from what continental country. This is the more desirable in the cases of Clover and Flax, since both of these crops are infested with peculiarly destructive weeds, which there is every reason to believe is derived from dirty foreign seeds. I refer chiefly to the Dodder, which has already been noticed in the *Agricultural Gazette*, but not to that alone. It is probable that the dirty seeds all come from particular foreign parts, and that by ascertaining the origin of the seeds which have produced crops infested with weeds, we may be enabled to supply farmers with such information as will prevent them from purchasing the dirty instead of the clean seeds. I venture to request the co-operation of farmers in this endeavour, and trust that those who may be inclined to assist in obtaining the above information will have the kindness to preserve a small portion of the prevalent weeds in the above crops, and send them to me for examination and botanical determination, together with all the information that they may possess concerning the origin of the seeds from which the crop was raised. A sample of the seeds themselves should also be preserved. It is only by obtaining extended information of this kind that we can expect to derive valuable hints for the guidance of the farmer. The parts of the weeds required are, the flowers, a few leaves, if the plant has any, the Dodder being without them, and, if possible, the seeds. They may be sent to me by post, addressed to St. John's College, Cambridge.—*Charles C. Babington.*

SKETCHES OF EAST LOTHIAN HUSBANDRY.

AGRICULTURE is improved either by the more general diffusion of information already existing, or by addition to the stock of information on the subject, by discovery. The comparative importance of either is determined by circumstances. When the various improvements in the science and practice of husbandry are already made available to the fullest extent, the attention will necessarily be directed to the adoption of further improvements, resulting from discovery. But there are few farms in the kingdom, and still fewer districts, of which this can be said; so that the more general diffusion of information already existing will long continue an important means of improving the Agriculture of the country. The practice of husbandry is, perhaps, nowhere so perfect that it would not be further improved by the introduction, to a greater or less extent, of the system of management elsewhere adopted; and the intelligent farmer, who is anxious to render his practice as perfect as possible, will, so often as opportunity offers, not fail to examine the practice of other districts for that purpose, and compare it with his own. One district may be famous for the rearing of stock, another for fattening them; while the manufacture of butter or cheese, or the cultivation of grain crops, may be the chief characteristics of others. Each, it may be supposed, will present the most favourable examples of superior management in its own peculiar department; and an inspection of each will not fail to instruct the farmer, whose labours are more varied, and whose attention is necessarily directed in a greater or less degree to them all.

But acquiring information in this manner is attended by a very considerable sacrifice of time and money—so great, in fact, that few farmers are inclined to encounter it; and, in consequence, it is not unusual to find many of the most intelligent farmers in the country, whose information, from personal examination, is confined to perhaps from 20 to 30 miles round the farms which they occupy. The same object is no doubt effected, although in an inferior degree, by a perusal of the reports of others in the various publications on the subject, which now happily so much abound. However inferior instruction communicated by means of the press may be to that acquired by personal observation, it is in the majority of cases the only means available; and of the value at present attached to it there cannot be more conclusive evidence than the existence of such publications as the *Agricultural Gazette.*

Premising these general remarks, it may be further observed, that as the practice of Agriculture is so much regulated by local circumstances, it seems manifestly unwise to recommend the system of any particular district, however excellent, for general adoption. Local circumstances alone must determine the value of any peculiarity of practice, although the details of the practice of any well-cultivated district may afford useful hints in some department to almost every reader. It is with these views that I conceived an account of East Lothian husbandry might be perused, not only with pleasure but also with profit by the readers of the *Gazette*. Even under the most dissimilar circumstances, instruction may be derived from contrast as well as from analogy. I am most anxious to confine myself to facts, leaving the reader to draw his own conclusions.

The Lothians have long been celebrated for their superior cultivation. There are no doubt other districts in England and Scotland in which the breeding and management of live stock are better understood; but it is to be recollected that East Lothian in particular is chiefly a Corn-growing district, the rearing and fattening of live stock being generally a secondary consideration with most of the East Lothian farmers. It is here also that the thrashing-machine, now so essential on tillage farms, was first employed; and it is well known that the ploughs, grubbers, and many other agricultural implements, have been here so much improved, that they are taken from this to the most remote parts of this and other countries. It is here, too, that the quality of the cereal grains has been brought to its state of greatest perfection. No shire in Scotland can compete with this in the quality of its grain—none gives a larger return when milled, or brings a higher price in the market.

In presenting the readers of the *Agricultural Gazette* with a series of plain articles, descriptive of East Lothian farming, I wish it to be understood that I am by no means desirous of representing the system there pursued as approaching perfection in every respect. Science has shown, and its greatest admirers must admit, that the tillage husbandry of certain districts in that county, however deserving of the reputation which it has already acquired, and to which its present comparatively advanced character entitles it, is still susceptible of great improvements, and that its best farmers have yet much to learn in almost every department of their profession.

Before entering into minute details of practice, a few statistical particulars, together with a brief description of the soil, climate, &c., of this interesting county may not be unacceptable to the general reader, and will form a necessary preliminary to the more practical subjects which are afterwards to be noticed. The era of agricultural improvement in this shire is said to have commenced at the period of the Union in 1707. Fanners were introduced from Holland by Andrew Meikle, in 1710. John Walker, tenant-farmer at Beanstone, near Haddington, was the first who practised and showed the utility of fallowing; and as early as 1724 summer-fallowing became common on all strong clay-soils throughout the county. The first park or pleasure-ground was one containing 500 acres, inclosed by the Duke of Lauderdale, at Lennox-Love, about the same period; but it was not till towards the beginning of the present century that farms were subdivided by thorn hedges or stone dykes as at present. It appears also that horse-hoe husbandry and Turnip culture were introduced and practised by Wight of Ormiston, in 1736; that the Potato was first introduced in 1740, but that this invaluable esculent was not grown in the open fields till about the year 1760. After the Union the celebrated Cockburn, of Ormiston, by introducing and granting long leases, did much to promote the agricultural interests of the county, and to disseminate the spirit of improvement amongst the tenantry. Since that period East Lothian may be regarded as one great experimental farm for the advancement of husbandry, under the care of a series of spirited individuals, who emulated each other in the introduction and practice of useful agricultural improvements.

This county has the honour of being the birth-place o some of the most distinguished Scotch agricultura authors and mechanics; of whom, however, I shall here mention only the names of two,—Robert Brown and Andrew Meikle,—the former author of a well-known "Treatise on Rural Affairs," and original editor of the "Farmers' Magazine;" and the latter the ingenious inventor of the threshing-machine.

The extent of East Lothian, according to the most accurate admeasurement, is 282 square miles, or 180,480 acres, of which 104,530 acres are arable, the remainder being occupied in permanent pasture, woods, wastes, &c.

The number of farms, of all sizes, in the county is at present computed at 418.

The annual value of real property, as assessed in 1815, was 251,126*l.*, and the annual rental as assessed for the year ending 5th April, 1843, 244,856*l.* 6*s.* 9½*d.*

The population of East Lothian, in 1831, was 36,145, and in 1841 it was 35,781, showing a decrease of about one per cent. The number of agricultural families in 1821 was 3009, and in 1831, 2840, showing a decrease of 169 in these ten years; arising, doubtless, in consequence of the gradual enlargement of the farms, which took place during that period.

General appearance.—East Lothian is divided into highlands and lowlands,—the former inland, and the latter adjacent to the Frith of Forth. The highland district is part of the extensive range of the Lammermoor hills, which separate this county from Berwickshire. From these hills the land slopes in the most pleasing manner towards the sea; Nature has elegantly disposed the surface of this shire into ranges of hills and fertile dales, traversing the county from east to west, and presenting a beautifully varying surface. On account of this, its undulating appearance, East Lothian is said to bear some topographical resemblance to Northampton. The entire aspect of the county bears the stamp of long continued and judicious improvements, and their invariable effects of general opulence and prosperity. When viewed off any considerable eminence, such as the Lammermoor and Garleton hills, or North-Berwick-Law—the latter being an isolated, conical hill, near the town of that name—the scenery all around is truly picturesque, and the beauty of the landscape almost unrivalled. Elegant seats of the nobility and gentry, surrounded and adorned with well-kept policies, plantations, &c.; compact and well-arranged farm-steadings with their elevated steam-chimneys, extensive stack-yards, and other appurtenances, meet the eyes of the observer in every direction.

Soil.—The soil of East Lothian is, like the appearance of its surface, much diversified. Its general character is a strong stiff tenacious clay, naturally very fertile, but most difficult and disagreeable to labour; commonly requiring four or five ploughings, and an endless number of harrowings, rollings, grubbings, &c., even in favourable seasons, before it can be sufficiently pulverised and prepared for a Turnip crop; while in wet adverse seasons, such as the last, it is almost impossible to labour it to any degree of perfection. Skilful and extensive thorough-draining has, however, very materially improved its character in this respect. In its natural state this soil retains water like a sponge, and when once thoroughly saturated with it, requires a long time to become dry and ready for working. When ploughed in a wet state, the soil adheres to the plough like mortar, the work is improperly executed, and the land greatly injured from the poaching or tramping of the horses; while, on the other hand, if ploughed when too dry, the soil turns up in large obdurate cakes, frequently defying the united forces of all the usual tillage implements to reduce them, until it receives a days' rain; after which the clods crumble, and break down with the action of the harrows. Difficult and disagreeable to labour as the strong clayey soil of this country undoubtedly is, yet in favourable seasons it produces very abundant crops of Wheat, Oats, Barley, Beans, Swedish Turnips, and Clover. These

remarks do not, of course, apply to all the arable land in East Lothian, there being some excellent light Turnip soil in several parts of the county, particularly in the neighbourhood of Dunbar, and generally along the coast of the Frith of Forth. The greater part of the shire lies upon beds of red sandstone, whinstone, limestone, and granite. The prevailing colour of the land is brownish-red.

Climate.—The climate of East Lothian, though variable, is naturally mild and salubrious. It has been much improved of late, by the extension of thorough-draining, and by the high state of cultivation to which the county has been brought. Compared with that of England and Ireland, it is much colder, with a longer continuance of frost and snow during winter; but dryer, and less frequently deluged with rain, throughout the other seasons, than the latter country. As an instance of what is here considered early ripening, I may mention that a quantity of new Barley was sold in Haddington market on the 22d of July, 1842. We frequently experience some very chilling east and north-easterly blasts from the German Ocean; our heaviest rains come from that quarter, often continuing for three consecutive days. The lowlands of East Lothian are, however, supposed to receive less rain throughout the year than any other district of a similar extent in Scotland. This circumstance, combined with a strong fertile soil, and good management, renders it peculiarly adapted to the production of its staple crop—Wheat.

Woods and Plantations.—The most of the land being very valuable for the production of Corn, there are few extensive plantations in the county. Binning Wood, at Tyningham, the seat of the Earl of Haddington is, however, one of the most magnificent forests of hard wood—chiefly Beech and Oak—in the lowlands of Scotland. The most remarkable circumstance connected with this Wood, is the great size to which many of the trees have attained, considering the apparent unsuitableness of the soil and situation. Tyningham is situated on the north bank of the river Tyne, at its junction with the sea; the fields around the house consist chiefly of light blowing sand, and before being planted were of no use but as a rabbit-warren. The plantation, however, proved strikingly successful, the trees growing to the water's edge. What its noble planter, Thomas, sixth Earl of Haddington, has said of the Oak, is worthy of notice:—"As the Oak is my favourite tree, I have planted it everywhere; and I can show them very thriving on rich, poor, middling, heathy, gravelly, clayey, mossy, spouty, and rocky ground; nay, even upon dry sand." There are some excellent plantations and much fine timber in other parts of the county, but they need not be noticed here.

Size of Farms.—The farms vary in size according to their locality. Near the towns 250 to 300 acres is considered a good size, and in more remote situations, 380 to 500; while in some parts of the county it is not uncommon to find them so large as 700 or 900 acres; but the average size of farms in East Lothian ranges between 300 and 360 acres. In medium soils suited to the five-shift rotation of cropping, a man and pair of horses are considered to be capable of working, in ordinary seasons, from 60 to 75 acres, and, where the soil is light and free, 70 acres. By a recent county regulation, 60 Scotch acres are denominated a Ploughgate. I may here mention, that on this and all future occasions, when the word acre is used without any explanation, the imperial measure is meant; the Scotch acre is above one-fourth larger than the English.—*T. Sullivan.*

ON MINERAL AND INORGANIC MANURES. No. XVI.

By Professor Charles Sprengel.

c. Marl from East Friesland (loamy). 100,000 parts consist of

75,998	parts	silica and quartz sand
1,950	»	alumina
5,008	»	oxide and protoxide of iron
0,480	»	oxide of manganese
4,860	»	lime
0,927	»	magnesia
0,200	»	potash combined with silica
0,540	»	soda combined with silica
2,040	»	sulphuric acid, combined with lime as gypsum
2,131	»	phosphoric acid, combined with lime and oxide of iron
4,246	»	carbonic acid, combined with lime and magnesia
1,000	»	coal of humus
0,620	»	humic acid, combined with lime, magnesia, alumina and iron, traces of common salt
100,000	parts.	

If considerable quantities (say 1000 cubic feet per acre) of this marl are used, especially if along with some dung employed (for the sake of nitrogen), the moors and heath soils will produce all sorts of crops, as every one admitting the influence of mineral substances on vegetation will easily understand. 1000 cubic feet. equal to 100,000 lbs, of this marl, will bring on the Magdeburg acre the following quantities of important mineral substances:—4860 lbs. lime, 927 lbs. magnesia, 1950 lbs. alumina, 2040 lbs. sulphuric acid combined with lime as gypsum, 2131 lbs. phosphoric acid, and 740 lbs. of potash and soda. As this is more than is required for many crops, 500 lbs. per acre would be quite sufficient. The above soils, however, require also to be improved physically, on which account more rather than less is to be taken. This marl is deficient only in chlorine, on which account, as well as on account of nitrogen, a simultaneous manure of dung will be necessary, unless a chlorate salt be used.

d. Marl from Magdeburg (clayey). 100,000 parts consist of

58,351	parts	silica and quartz sand
8,450	,,	alumina
6,670	,,	oxide and protoxide of iron
0,300	,,	oxide of manganese
18,201	,,	carbonate of lime
3,794	,,	carbonate of magnesia
0,520	,,	phosphate of lime
2,139	,,	gypsum
1,575	,,	potash and soda united with silica and traces of common salt
100,000	parts.	

This marl is used with the best possible result on dry sandy soils, and as an alterative of their texture. 5000 or 6000 cubic feet were used per Magdeburg acre. It has been impossible hitherto to grow Lucerne here. Since, however, this marl has been used, it grows luxuriantly, which is easily explained, by the marl supplying these soils with a great quantity of gypsum, which is soon conveyed by the rain water to its deep roots. Even if only 80,000 lbs. of marl per acre be used, still this acre would receive thereby 1240 lbs. of potash and soda, which, although they are combined with silica, are still gradually washed down to the subsoil; for the silicate will be gradually decomposed by the carbonic acid of the rain water and the air. This marl being deficient in phosphate of lime and common salt, cannot be called the very best, and therefore quantity must make up for quality.

ON THE CULTIVATION OF FLAX.—No. V.

Although the duty of preparing the Flax for market should not devolve on the grower, for reasons stated at length in my last paper, yet under the most favourable circumstances the manufacture will still be performed by the farmer for some time to come. Our account of the cultivation of the crop would not, therefore, be complete without also presenting the reader with some information as to the management necessary to be adopted in the subsequent processes before it is ready for market.

The period of pulling the crop obviously depends, in a great degree, on the intention of the cultivator. When it is wished to procure fibre of fine quality, in which case the crop will have been thickly sown, it is necessary to pull green; but when the saving of the seed is a principal object, a greater degree of ripeness is required. As the saving of the seed should never be neglected, a sort of compromise, if the term may be allowed, should be made with regard to the precise degree of ripeness of the crops; it should not be pulled so early as if no value were placed on the seed, nor should it be allowed to become so ripe as if the quality of the seed were the chief consideration. To judge of the proper time for pulling, the best criterion is when about two-thirds of the stalk is observed to turn yellow and to lose its leaves; and also when by cutting the seed-pod across with a knife, the seeds have changed from their fluid state. The quality of the Flax, as well as that of the soil on which it is grown, must be taken into account in determining the precise period at which it should be pulled, and on all these points some experience will be required.

It is here necessary to observe that when, through any circumstance, any portion of the crop is lying, it should be pulled without delay, without any reference to its state of ripeness, as in that position it would speedily be destroyed. This it is important to keep by itself; the mixture of different qualities producing an inferior sample, besides being at variance with economy, as regards quantity alone, as in undergoing the after process of manufacturing, one part will be broken and carried away in the manipulation, before the other is sufficiently reduced. In like manner, and for a similar reason, the long, middling, and short Flax should be tied up separately, each variety requiring different treatment. Great diversity of quality before pulling is, however, a sympton of defective cultivation, as unless in the case of a diversity of soil the quality should be uniform throughout. Under all circumstances, taking up the crop in a wet state is to be avoided if possible.

In Ireland, Flax is usually taken up by women and girls, who also attend to the grassing, turning, and lifting, after being watered. In districts where the common Rush can be procured, bands for the Flax are formed of Rushes, having been previously beaten with a mallet, and dried by exposure to the sun. They are also formed into bands before coming to the harvest-field, each person supplying herself with two or three dozens of them, which are fastened round the waist, and used as the pulling goes forward. The pullers are particularly to observe that the different handfuls are regularly placed, so that the stalks may lie even at the ends, and should any long weeds, as Thistles or Rag-weed occur through the crop, they must not be pulled with the Flax. When Rushes cannot be procured the bands are formed of the Flax itself. Straw is not suited for this purpose, being rotted by the watering process.

The management of the Flax after pulling, in some degree depends on the course which is afterwards to be adopted. In Ireland, and also in certain districts on the Continent, the crop is made to undergo the watering process a few days after it has been pulled, or so soon as it can be conveniently rippled; while in other cases it is dried in the field and afterwards stacked up, to undergo the subsequent operations in the ensuing season, when the weather is favourable for the purpose. Until lately the saving of the seed was generally disregarded in Ireland, but it is obviously of too much value to be neglected in any case.

When the Flax is to be watered in the autumn, the rippling should be carried on almost simultaneously with the pulling of the crop. In this case the pullers should place the handfuls of Flax slightly crossing each other on the bands, as the pulling goes forward; and their handfuls should be of such a size that they can be grasped readily afterwards by the hand in rippling. The purpose gained by placing them in some degree crossing each other, is to facilitate the separation of the handfuls afterwards, which, by careful handling, may be easily done, and thus not only save trouble, but prevent the Flax from being injured by rough treatment. The bunches should be small, and the several handfuls laid loosely together, so that the Flax may be slightly seasoned after pulling, before rippling. Where a large quantity is to be manufactured, the number of hands employed at the respective operations of pulling and rippling should be regularly apportioned, so that they can keep pace with each other, and the rippling may commence the day after the pulling, and thus allow a day to intervene between the performance of the two operations, for the purpose of drying the Flax.

The importance of the foregoing arrangements will be manifest on a little reflection, and much inconvenience is often occasioned by not attending to them. Frequently in the hurry of pulling, the Flax is at once bound up into bunches, in which it remains on end a few days before rippling; but then when the latter process comes to be performed, great loss of time is experienced in the separation of the Flax again into handfuls, besides being productive of much injury to the Flax itself. These minutiæ may appear irksome to the general reader, but the Flax-grower must remember that attention to these will, in most cases, constitute the difference between success and failure in his operations.

Before the rippling process is commenced, the capsules should be so much hardened, and the seeds themselves have attained such a degree of ripeness, that the former will readily break down on being subjected to pressure, and admit of the separation of the seeds from the matter with which they are surrounded. This is necessary to prevent fermentation actively setting in among the capsules after being taken off the Flax, which it would at once do if any excess of moisture be present. The saving of the seed is, indeed, at all times difficult, when the crop is watered in the autumn, and even with the greatest care fermentation will set in, unless the capsules be thinly spread on a dry floor and repeatedly turned over.

The rippling machine is an instrument like a comb, the teeth being of iron, usually fastened in a wooden block, and attached to a plank or long seat, as shown in Figure 1. The teeth should be round, smooth, and tapering, standing about twelve inches out of the wood, and placed at such a distance from each other as to prevent the seed-pods from passing through. Two persons are usually employed in rippling, each alternately drawing his handful of Flax through the machine, which is placed in the centre of a large winnow-cloth, on which the seed-pods are collected and carried to the barn or other place in which they are to be preserved. The cloth and rippling machine are moved from place to place, through the field, as the work goes forward; and after rippling, the Flax is again bound up into bunches or sheaves, to be taken to the water. To preserve uniformity in the watering, the produce of each day's rippling should be placed in a separate pond.

The capsules containing the seed are now to be spread thinly over a boarded floor to which the atmosphere has free access, and turned repeatedly until thoroughly divested of their natural moisture, when they may be stored up in any quantity required. In moist weather, and when the quantity of seed on hand is large, it is extremely difficult to save the seed properly, even under the most careful management. When the seed is intended for crushing or feeding, a slight kiln-drying will not be injurious, and will save much labour in preserving it; but when intended for sowing, this process would manifestly be injurious, as interfering with its vitality. —*J. Sproule.*

ON THE APPLICATION OF CHEMISTRY TO AGRICULTURE UPON RATIONAL PRINCIPLES.—No. XVI.

(*Continued from p.* 284.)

In the beginning of last year I performed a comparative experiment with sulphuric acid and gypsum, as fixer of the nitrogen in urine.

This experiment has been related by Professor Henslow, in the first Number of this Paper; but as I consider the subject of extreme interest, I will detail some parts of the experiment which he omitted, more especially my notes of the manner in which the fixing media acted upon the liquid. I procured three barrels, each holding 54 gallons, which were gradually filled with human urine, between the 27th of Jan. and the 6th of April, the same quantity having been added to each alternately every morning.

Barrel No. I (A.)—*Jan.* 27. Put into the acid of ounces, by measure, of concentrated sul*Feb.* 14. The sp. g., 1.850, and one gallon of —

urine had no acid re-action upon litmus. I therefore added 3 ounces more acid (by measure.)—*Feb.* 17. About 20 gallons collected, which had a strong acid re-action. —26th. The urine of a dark colour, but not putrefied.—*March* 20. Barrel full, no putrefaction.—*April* 6. Solution nearly neuter, but slightly acid; no putrefaction. Applied to the land, as stated by Professor Henslow. (*Vide* "Agricultural Gazette," No. 1.)

BARREL No. 2 (B.)—*Jan.* 27. One gallon of water, and 5 lbs. of gypsum, which, by mistake, was burnt plaster of Paris.—*Feb.* 17. Acid re-action; no putrefaction.—26th. No acid re-action. I then added 5 lbs. of the hydrated gypsum, and, curious enough, five minutes after, the solution re-acted upon the litmus; no putrefaction; 30 gallons collected.—*March* 11. Solution neutral.—24th. Barrel quite full, and beginning to putrefy. Alkaline re-action. Added 5 lbs. more gypsum.—*April* 2. Urine putrefying, and ammonia escaping in considerable quantity. Solution alkaline. Added 5 lbs. of gypsum.—6th. Ammonia escaping. Applied it to the land.

BARREL No. 3 (C.)—*Jan.* 27. Added only 1 gallon of water. The solution began to decompose about a fortnight or three weeks from the commencement, and the ammonia escaped freely until the day of application.—*April* 6. By direct experiment I found that 16 gallons of this urine in a state of decomposition, required 60½ ounces, by weight, of concentrated sulphuric acid of sp. g., 1.850, for neutralisation; producing, according to previous calculation, about 112 ounces of sulphate of ammonia.

In the first barrel it is clear the urea in the urine did not decompose, and therefore no ammonia was generated. The action of sulphuric acid upon fresh urine produces a compound of urea, the nature of which is still undetermined; but the result of my experiment proved that the nitrogen was supplied to the plant, probably by its conversion in the soil into carbonate of ammonia. The action of the gypsum was unsatisfactory. 20 lbs. of gypsum contain about 12 lbs. of sulphuric acid. If chemical action had taken place to any extent, the ammonia ought to have been fixed; for although 54 gallons of putrefied urine require 16 lbs. of sulphuric acid to neutralise the carbonate of ammonia, it will be perceived that the urine in Barrel No. 2 did not decompose until about 12 days before the liquid was applied, in consequence, probably, of the anti-septic quality of the gypsum; but that, when decomposition took place, the ammonia escaped as freely as in Barrel No. 3, which it ought not to have done had the gypsum acted upon the carbonate. It would have been more satisfactory certainly, had double the quantity of gypsum been used. The experiment was performed on what the farmers call a light loam, which had been cropped with Turnips, and fed off with sheep the preceding winter.

The analysis of 400 grains of the soil, obtained 3 or 4 inches from the surface, and kept dry for a week, gave the following result:—

		Grains.
Specimen (400 grs.), ...	Sp. Gr. 1.57	
Moisture		17
Siliceous and Calcareous Coarse Sand . . .		27
Fine Sand		249
Impalpable Matter, which contained—		
Carbonate of Lime and Magnesia . .	17	
Animal and Vegetable Matter . . .	8	
Oxide of Iron	6	78
Alumina	20	
Silica	27	
Loss		25
		400

Of this field I had 7 patches carefully measured by a land surveyor. The first 6 contained exactly 8 perches each, the last had unavoidably $\frac{1}{10}$th of a perch more, and this we accordingly gave to the benefit of the unmanured crop. As the field was not in my own occupation, I had not that control over the sowing which I should like to have had, and the consequence was that the seed (Barley and Clover) was sown the same day that the liquid was applied. The proportion used, and the important results obtained, will be seen by a reference to the First Number of the "Gazette," from which I deduce the following facts:—

1. Ten gallons of urine, equal to 80 lbs., fixed with sulphuric acid, produced over and above the same quantity of land without any manure, 37 lbs. of grain, and 41½ lbs. of straw—78½ lbs. of produce; being an increase per acre of 1580 lbs. of produce. By measure the increase was 15 bushels per acre.

2. Fifteen gallons of urine, equal to 120 lbs., produced 32 lbs. of grain only, and 8 lbs. of straw—40 lbs. of produce; being an increase per acre of 800 pounds. The liquid was in this case evidently too strong for application the day of sowing. Had it been used a week or fortnight before, the result would probably have been different.

3. Ten gallons of urine and gypsum, equal to 80 lbs., produced 13½ lbs. of grain, and a loss of straw of 27 lbs.

4. Fifteen gallons of urine and gypsum, equal to 120 lbs., produced 12 lbs. of grain, and a loss of straw of 14 lbs.

5. Ten gallons of urine, equal to 80 lbs., not fixed with anything, and the ammonia allowed to escape before application, produced 9 lbs. of grain, and a loss of straw of 18 lbs.

6. Fifteen gallons of urine unfixed, equal to 120 lbs., produced 19 lbs. of grain and 10 lbs. of straw—equal to 29 lbs. of produce; being an increase of produce per acre of 580 lbs. With regard to the Clover, that which was mown with the Barley was of course taken account of in the straw, and the layer has still to be noticed.—*C. R. B., Stowmarket.*

Home Correspondence.

Gorse.—I have used Gorse 14 years this season for dairy cows, fattening cows, and horses, all of which it suits equally well.—Sheep I have not tried it with. I doubt whether they will easily be got to eat it,—they do not like anything which has been much bruised with iron. Whins must be bruised, and my machine is iron.—Three bushels and a half per day, unmixed with any other fodder, is sufficient for each cow. I have 24 cows in one house; besides the Whins, they eat per day one hundred weight of hay and eight bushels of Swedish Turnip amongst the 24 cows; being about four pounds and a half of hay per cow per day, and 20 pounds of Swedes per cow per day. On this, dairy cows are kept in excellent condition, and the butter is remarkably good; fattening cows will feed fast. When Swedes fail or are scarce, I substitute about four pounds of oil-cake per day to each cow, and as the fattening cows get forward, I increase the quantity of oil-cake gradually; the most I give is 12 pounds per day to large cows, and that only for the last month.—The Gorse is first put through a common chaff-cutter, then bruised in a mill similar to the old cider-mill; the revolving wheel surrounded with fluted iron; at the bottom of the chase a plain iron plate.—It is sown as Clover seed, with a crop of Barley or Oats—is fit to cut the November 12 months after sowing; it is then mown every year during the winter, as wanted, with a common scythe, close to the ground; on good dry land will cut from seven to ten tons per acre.—The plant I use is called French Furze, but is very common in England.—I grow it on an old woodland, stocked up, part a burning gravel, part a strong clay, but very dry at bottom, and very hilly. Half an acre of this land is on the average sufficient to keep a cow 20 weeks. On rich loamy dry land I have no doubt nearly double quantity may be grown.—There is no danger in using it if it be well ground, and mixed with salt in the proportion of four ounces per cow per day.—The mowing, carting, cutting, and bruising, costs not quite a penny a bushel.—It requires no manure, but in its consumption creates a great deal. Will grow on poor hilly land, if dry, which will not pay for cultivating. When once sown and well rooted, it yields a great quantity of food for cattle at no other expense but the one above stated. I have cut the same ground now for 14 years—have done nothing to it, and with the exception of some parts of the burning gravel which the hot weather has this year affected, it seems to promise as good a crop as heretofore. I generally begin to mow it as soon as Grass is gone, and it lasts till Grass comes again. If there is an appearance of snow, I mow some quantity beforehand, and it will keep thrown down in heaps in the rick-yard; but it must not be bruised till it is wanted, as it will not keep after bruising.—The quantity of seed to be sown per acre, is 20 pounds. Mine is sown broad-cast, but I should recommend it to be drilled as near in the rows as will admit hand-hoeing for the first year or two, if the land is inclined to run to Grass. I do not feed with Furze on a Sunday, as the cows do not like it unless it is given them fresh from the mill.—*Richard Spooner, Worcester.* [The above is a connexion of the answers in a short catechism on this subject which has been published in various papers, and also as a placard.]

Peat-Drains.—Allow me to state, as a further proof of what is said in Nos. 30 and 48 of the *Gardeners' Chronicle* of last year, as to the durability of peat draining, that I saw some peat-draining a few days ago which had been made 30 years ago at Nateby, Lancaster, and they were as perfect and as sound as they were when laid down in the drains; they are laid in the same way as those described in No. 48 of the *Gardeners' Chronicle* of last year, on shoulders; that is, there being a bearing of about 2 in. on each side of the drain for the covers to rest upon, so that there was a drain of 6 in. clear in width, and about 6 in. deep for the water. The peat-draining covers are 10 in. long, 7 in. broad, and 2 in. thick. Inert peaty matter remains for years exposed to water and air without undergoing any change as to decay, but it grows stronger after having been some time inserted in the drain. At the present time there is a difference of opinion as to which is the best sort of peat for the purpose of draining with. The black peat appears to me to be the best, as in the drains alluded to, some of the lighter coloured sorts I found were not so stiff as the black, and they appeared almost as hard as stone when taken out of the drain. I am informed by the man who made those drains, that those peat covers had not been made on purpose for draining with, but were taken from the stock which had been made for the firing of the farm-house.—*Facile.*

Leases.—Would it not be a much wiser plan for landlords, instead of tying down their tenants as to the rotation of crops, &c. &c., to fix what amount of stock should be kept upon the farm, in thriving condition? If a farm was kept stocked with a proper number of horses, cows, sheep, and pigs—all well kept—and no straw or manure sold off, a farm must improve. It would be easy to have a fixed fine, as is now the case if the terms of a lease are broken, for non-fulfilment of the agreement as to stock.—*W. D. F.*

Bigg's Sheep-dipping Composition.—I should be very glad to call the attention of such of your readers as keep sheep to this plan of dipping them. I tried it first five years since, and most of my neighbours now use it from seeing the benefit to my flock. Every one who wishes for the comfort of his animals would, if this were all, use it; but I find it improve the health and wool of the sheep very much; it frees them from all cutaneous disorders, kills the ticks and lice, and inasmuch as they never lose time and strength and temper by rubbing and scratching themselves, they use much less food, and have more time to sleep.—*W. D. F.* [A known correspondent.]

Moles.—Your correspondent "B. W." has been misinformed: "The tenants of the Duke of Buccleuch" never resolved to destroy no more moles. His tenants in this and the adjoining counties form two classes, viz.: tillage farmers, and sheep-masters. "W. B.'s" information could refer only to the latter class, who pasture sheep on the Cheviot hills. A former Duke of Buccleuch had his pastoral grounds extensively surface-drained. It was soon found that the Moles rendered these drains useless, by working peaty-soil in, which stopped the water. Moles had been caught on the tillage-grounds from time immemorial; but till now, they had been allowed the full range of the hill pastures. The Duke, to prevent the waste of his expenditure on drains, ordered an extensive destruction of the Moles. The Cheviot pastures were extensively improved by this draining, and enabled to support much heavier stocks; but in many places the herbage proved unwholesome, and induced a disease known to shepherds by the name of "Pining." The pasture, especially in dry seasons, became too astringent, and inflammatory diseases caused serious loss. Sheep are known to require a portion of saline or alkaline matter, and the surface on which they tread requires to be rough enough to prevent over-growth of their hoofs. But the want of Mole-hills, and the increased smoothness of the pastures, which soon followed the draining, both prevented their access to portions of fresh earth, and allowed their hoofs so to grow, that their overgrowth, aided by the inflammatory character of the herbage, induced foot-rot. Some of these sheep-masters, about 15 or 20 years ago, ascribing the disease of their flocks to the want of succulent herbage, which they imagined was produced by the Mole-hills, dismissed the Mole-catcher from their pastures; but as the quality of the herbage was much more altered by the drainage than by the want of Mole-hills, this remedy was found inadequate in dry seasons, while in wet seasons the pasture was so injured by the Moles stopping the drains, that, as far as I can learn, in every case they soon recalled the "moudie-man." The man who catches Moles for me told me, to-day, that he spends ten weeks every summer among the Duke's hill-tenants. On tillage-land, which is naturally so dry as to need no artificial drains, I never saw Moles very numerous; but where under-draining has been needed and effected, Moles multiply rapidly, and if not destroyed, soon render the drains useless, and greatly injure the drilled green crops. My farm had formerly been well drained, and had lain several years in pasture. Mole-catching had been neglected. The drains gradually became useless. I drained anew, and in cutting through numberless old drains, I found all choked with mud, wrought in by the moles. As mole-hills were chiefly on the top of old drains, this often aided me in discovering the course of a drain. My first drilled green crops were so overrun by moles that about a third of the plants were thrown out, when in rough leaf, and, but for the aid of the "moudie-man," I might have harrowed them over. The earth-worm is truly the farmer's friend. As the mole lives on the earth-worm, he is the farmer's foe. Let "B. W." look over to the "*green* Isle," where Moles do not exist, and the view will convince him that we need not their aid.—*G., Dumfriesshire.*

Wheat-crop.—A neighbour of mine has a field of about 6 acres, which was sown with Wheat in the autumn of 1842. The following spring it was an early and luxuriant crop, and continued so until the straw began to change colour, when it fell, from its great bulk, and, never having been able to rise again, became flat on the ground, and was with difficulty cut by the reapers. Before its removal from the field the greater portion of the grain was left on the ground. The land is of excellent quality, capable of producing from 30 to 40 bushels of Wheat or Barley per acre. At the proper season the stubble was ploughed, and sown with winter Vetches; the self-sown Wheat also came up, and at this moment a most luxuriant prospect appears for a Wheat-crop next harvest. My recommendation was, at the end of March, to graze it with sheep as close as possible to the ground, and keep it as a Wheat-crop for the ensuing harvest, instead of cutting it as green food for horses. The owner prefers the latter.—*M. Sayce.* [Perhaps if our correspondent's advice had been taken sufficiently early, it might have been advisable to take the chance of a crop of Wheat; but now, as the Vetches must be pretty strong on the ground, we should advise the cutting of the crop for horses, &c. It is well to abide by the principle of an alternate system of husbandry.]

Stall feeding Cows.—I observe many of your correspondents speak in high terms of the advantages of stall-feeding cows; and if increase of manure and the profitable employment of green crops are the only points to be considered, they are probably right. But are they aware that after a time all these animals are found to have tubercles on the lungs, and would, if not killed, die consumptive? In the commencement of the disease they yield more milk, fat kindly, and the meat is said to be sweeter; but can either the milk or the flesh be so wholesome? Every medical writer cautions us against employing as a wet nurse a person who shows the slightest tendency to consumption; is it not reasonable to reject likewise the milk of animals kept in confinement and deprived of three of the great essentials to health, pure air, plenty of light, and exercise? Some practical chemist might be found who would analyse the milk, and inform us in what it differs from the milk of animals who are fed in the open air.—*X.*

Superphosphate of Lime.—One of your correspondents complains that bones will not dissolve in sulphuric acid unless they are previously reduced to powder. Either his sulphuric acid was not good, or he had not patience

to wait the event. It takes many days to dissolve broken bones in sulphuric acid. Muriatic acid only dissolves the earthy part of bones, but sulphuric acid will speedily dissolve what the muriatic has not accomplished. What I write is from my own experience.—*C. A. A. Lloyd.*

Curl in Potatoes.—I do not recollect having seen it noticed in your valuable Paper that Sea-weeds spread in very moderate quantities on land are an unfailing preventive of curl in a Potato-crop. This is perfectly understood on the coast of Ireland, and such is the value set upon these plants for the purpose, and for manure, that I have known it to be a practice with humble cottiers to get out of their beds at night to collect them on the shore previous to the return of the receding tides, afterwards bringing them up steep cliffs in baskets on their backs. In the west of England, too, the value of the Sea-weed is appreciated; but it may be noticed with surprise on the coast of the Isle of Wight, that this species of manure is much neglected. Here it grows and flourishes generally untouched. I never above once have seen it used in this island, and then it was thrown in a heap to rot (and consequently lost most of its valuable properties), instead of being spread when fresh over the land. I am enabled from my own frequent observation to state that a moderate manuring of Sea-weed will cause land of middling quality to yield two good crops; viz., a crop of Potatoes followed by Wheat, Oats, or Barley, according to the nature of the soil. I may here observe the disease of rot or taint in Potato-seed was formerly little known. Forty years ago, while living in the "land of Potatoes" I never heard of it; and probably this was owing to the manner of preparing the seed. There it was the invariable custom to spread the cut sets on a dry earthen floor of a house, in shallow heaps, until the action of the air dried and healed, or hardened the parts wounded by the knife.—*A Gardener, Isle of Wight.*

Gas-water.—Within the last two or three months, I have analysed several samples of water from different gas-works, taking it as soon as generated, and using every precaution to protect it from atmospheric influence; but in no instance have I found it require more than 24 grains of the acid to neutralise half-an-ounce of the water; in most cases one scruple was sufficient, or 1-12th of the weight of the ammoniacal water acted upon. Now there is a great difference betwixt this and "Govyn's" statement in your Notices to Correspondents a few weeks ago. There appears to be something in gas-water injurious to vegetation, although the ammonia acts as a transient stimulant after the effects of the other matter has subsided.—*J. T.* [In answer to a portion of our correspondent's letter which is not inserted here, we beg to inform him that we are responsible for the answers in the Notices to Correspondents; the parties whose signatures are given above each notice are those who ask for the information, not those who give it. The advice in this case was given upon data furnished by "Govyn," which, however, were so extraordinary, that we think he was mistaken, and we told him so.]

Farm Bailiff.—In page 201 of the *Agricultural Gazette*, your correspondent, "Martin Doyle," is sanguine as to the benefits to result from the Land Commission now acting in Ireland. It is truly admitted by all, that there has been, and is to an alarming extent, a neglect on the part of the land proprietors of Ireland of the Agricultural and social conditions of the people. Let that calamitous epithet of your correspondent, "Bad Landlord," be annulled by putting an end to the justice of it. This is what I call the "chief want" of Ireland, and not the importation of men into a country where their equals, like the beauteous hyacinth of our lovely vales, are unprized only because they are native. I trust it will not be inferred that I am intolerant as to strangers. I am not, but my plan would be, and I think my friend Martin Doyle will concur in it, to foster and encourage the indigenous, and bring their energies into active exertion, and I assert from my own experience that a sufficient number competent to act as bailiff are to be found in Ireland. I do not think that my friend should be surprised at the means of men of my class in England. Your correspondent knows full well that

> "Order is Heaven's first law; and this confest,
> Some are and must be greater than the rest:
> More rich, more wise; but who infers from hence
> That such are happier, shocks all common sense."

What but the wisdom and knowledge of your correspondent's "sporting-looking, shooting-jacketed, cob-mounted bailiff" gives him and maintains him in that enviable position, with his very "snug salary?" Knowledge is power, and wisdom is security; and I am of opinion that both, hand in hand, cannot be too well recompensed. I do not believe, with Martin Doyle, that a feeling of jealousy exists among the labouring classes of Ireland towards strangers. I speak now from experience and facts, that no class of men on earth pay more respect to strangers than do my countrymen, when those strangers prove themselves adequate to the undertaking in which they have embarked.—*A Horti-Agriculturist.* [From want of room we have been obliged considerably to abridge this communication.]

Farm Fences.—Inclosing farms with fences, and dividing them into convenient fields, is considered the first step towards substantial improvement. If a farm could always be kept in tillage, and no pasturing animals allowed, fences would be of little importance. But if a farm must be partly in tillage, and partly in pasture, fences are indispensably necessary to defend the tillage crops from the inroads of the cattle on the pasture. Even where land is devoted solely to pasture, it is proper to have it divided into separate inclosures, as the different animals can then be accommodated with the most suitable pasture by shifting them from one inclosure to another. The most ancient, and perhaps the most simple of all fences, are walls made of turf. These walls, however, are much injured by the atmosphere, and the rubbing and butting of the cattle. To guard against this, they should be planted or sown with the Ulex Europæus or Furze. The roots of this plant will soon penetrate the turf, and tend to bind the wall. The plants not only afford shelter as well as food for the cattle, but add to the height of the wall, and give it a formidable appearance. When walls are made for this purpose, they should be built at least three feet thick at the foundation, and tapering to 15 inches at top. The seeds should be sown on the top, and as the plants advance in growth, they should be regularly trimmed with the shears; by proper attention to this, they will be prevented from growing too tall and thin at the bottom. If this is annually repeated, the plants will be longer preserved in a healthy and vigorous state; clipping has also a good effect in checking the furze from spreading over the field. A good and substantial fence may thus be quickly formed, even on a soil that will not produce a living fence of any other kind. The Prunus spinosa or Sloe, is also well adapted for fences, either alone or mixed with other shrubs, and will sooner make a fence on a poor soil than the Hawthorn. The seeds should be sown on a prepared bed or mound where the future hedge is to be. It should be annually trimmed with the shears, and kept free from weeds, as should all living fences. It will grow on all soils, from the cohesive to the friable. The Spartium sesparium, or common Broom, a very common but beautiful shrub, is also well adapted for hedges. The seeds (which can be easily procured on any common) should be sown as mentioned above for Furze, and kept regularly trimmed; if not, it is apt to grow very tall and slender. The young shoots, when laid in the dung-pit to rot, make excellent manure. It is said that, when its twigs are eaten by sheep, a temporary giddiness, like intoxication, ensues, and its flowers are said to excite vomiting. Though the Hawthorn alone will form a sufficient hedge, when planted with care, it has been found to contribute greatly to the strength and closeness of the hedge to intervene some other kinds with it, as the Beech, Elm, Yew, Privet, Holly, and the Laurel. These plants, however, make excellent and durable hedges of themselves, and will bear any kind of trimming that may be thought proper to give a hedge, and one of them to every third of Hawthorn, makes an excellent hedge. Again, there are many other plants, though feeble of themselves, by mixing them with others of more robust habits, add greatly to the strength and closeness of a hedge. But where there are plenty of stones at command, stone walls, in point of real utility, are the most substantial and secure. The erection of a stone wall will be much more expensive than any kind of hedge, but when the ground to be inclosed contains many stones, which must at any rate be removed before it can be properly cultivated, a stone wall, either built with cement or not, considering its superiority, will be the most economical fence in the end.—*J. McI., Hillsborough.*

Mangold Wurzel.—Though the season for planting this most valuable root is now nearly past, I feel disposed to offer a few suggestions, the result of my own experience. I consider the distance of 26 inches between the rows (as proposed in a late Number) to be insufficient for thoroughly working the intervals, and I would recommend 30 inches, as fitting more accurately the distance between the cart-wheels for carrying out the manure; and also as being likely to give an increased weight to each individual root, and there is no question but that a heavy root is, in every respect, preferable to a lighter one. At 30 inches by 12, 17,420 plants (the number per acre) at 6 lbs. each, will produce 46 tons 13 cwt., and as we know Mangold Wurzel roots frequently weigh from 14 lbs. to 20 lbs. each, it is reasonable to expect them to average 6 lbs., at the above distances. Again—at 26 inches by 12 inches, the distance you recommend, an acre will contain 20,104 plants, which, say at 5 lbs. each, produce only 44 tons 17½ cwt.; and surely with the increased facility for working 30 inch intervals over those of 26 inches, an additional pound per root may be fairly calculated on. I think also the earthing plough is much more proper for forming the furrows for the manure, and covering it, than any other; the manure is more perfectly covered, the ridges better formed, and the work in every respect much neater. It was always my practice to manure five rows at once, by which means two of the rows escaped the consolidation of the bottom of the furrow, from the treading of the horses, and pressure of the wheels. With regard to the method of sowing the seed, I found, after trying different methods of dibbling, that the drill was far preferable. It may be set so as to distribute the seed with great regularity, and much more speedily than can be done by hand. I used only two lbs. of seed per acre, and always found plenty of plant, with greater facility of singling, as the plants never came up in bunches.—*Lusor.*

The Farmer's Capital and his Profits.—I thought, after reading the article under this head by "A Suffolk Farmer and Valuer," in your Paper of last week, it would be interesting to make an estimate of what the farm he describes, and which requires a capital of 5000*l.*, would produce in return. I have therefore taken his figures as correct for the outgoings, and I think I have put the income quite as high as I am justified according to present times. There are many other small items I know might be added on both sides, but every farmer is aware that it is impossible to make a very faithful estimate of what any farm will either cost or produce in the year, and also that the unexpected items are generally on the wrong side. I think I have sufficiently shown our occupation is not a very profitable one.

Acres.		£	s.	d.
120 of Wheat, at 4 qrs. per acre—480 qrs. at	50*s.*	1200	0	0
80 of Barley, at 5 qrs. per acre—400 qrs. at	30*s.*	600	0	0

I allow the 10 acres of Oats, and 15 acres of Peas as required for horse Corn. I am not acquainted with the custom of Suffolk as regards seeds and Vetches. I believe they sell some; but of course a great part, or an equivalent, must be consumed upon the farm. I think, therefore, I must allow little for them, particularly as I shall debit nothing for either artificial food or manure.—*A Norfolk Farmer.*

Potatoes.—From the obervations published from time to time in your *Gazette*, it should seem as though the causes of the curl and the rot in Potatoes are very imperfectly understood. I believe that certain varieties only, of the Potato, are subject to the curl. When I was young, a very excellent kind of white Potato was imported from Scotland, into the neighbourhood of Bristol annually, for seed; many growers attempted to save their own seed from the crop, for next year's planting; but, although the imported seed never showed any inclination to curl, the produce, when planted the next year, invariably curled. About 8 years ago I raised some Potatoes from seed, which produced five or six tolerably distinct varieties. Before these were separated, the whole being planted on one bed, I observed one variety infected with the curl, so that none of the foliage expanded, whilst all the others were, and still continue, quite free from the disease. I have been a Potato grower, on a large and small scale, for 45 years, and, although I never used any precautions to prevent curl, I never, during this period, had one crop in the least injured by the disease. I have planted seed of all qualities, both ripe and unripe; generally kept during winter, in ridged pits about 5 feet wide, sometimes cut and planted immediately, at others kept for two or three weeks, but never suffered from rot or curl: I always took the precaution to secure as good a tilth as possible; used sets taken from the finest Potatoes, cut with two eyes in each, and, which is of more consequence than many suppose, always placed the manure *upon* the sets. I think the rot is often produced by imperfect tillage.—*Lusor.*

Potato Preserving.—In reference to this subject, noticed by "H. P. T.," a short time since I raised some few Potatoes that remained in the ground during the winter, which were of a perfect good taste, and no doubt equally so as his own; but I attribute this solely to the very mild season we then had. I cannot myself find any better way of keeping Potatoes through the winter, than by storing them away in a grave of sufficient depth, laying the bottom and sides with long Wheat-straw, and having layers of a proper distance apart, each layer of Potatoes being closed over with a board lodged in the sides of the pit, and, above all, well covering in the top and sides. I recommend wooden boards as partitions between the layers, in preference to straw, which causes too much confinement and heat, thereby injuring the Potato. This, after some trial, appears to me the best method for the above object, and if used with a little prudence and good management, it will be found to succeed well.—*W. H., Reading.*

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A Weekly Council was held at the Society's House in Hanover Square on Wednesday last the 8th of May; present, the Rt. Hon. Earl Spencer, President, in the chair; Lord Camoys; Hon. R. H. Clive, M.P.; T. R. Barker, Esq.; W. H. Barrow, Esq.; T. W. Bramston, Esq., M.P.; W. R. Browne, Esq.; E. Buller, Esq., M.P.; F. Burke, Esq.; Rev. T. Cator; Col. Challoner; H. Colman, Esq.; E. D. Davenport, Esq.; J. Dean, Esq.; W. Fielden, Esq., M.P.; A. E. Fuller, Esq., M.P.; J. Grant, Esq.; B. Gibbs, Esq.; G. Kimberley, Esq.; Sir C. Lemon, Bart., M.P.; A. Ogilvie, Esq.; J. Parkes, Esq., C. E.; E. W. W. Pendarves, Esq., M.P.; W. J. Pickin, Esq.; H. Price, Esq.; E. A. Sanford, Esq.; Prof. Sewell; W. Shaw, Esq.; R. A. Slaney, Esq.; J. Spencer Stanhope, Esq.; T. Tweed, Esq.; and F. Woodward, Esq.

John Manners Sutton, Esq., of Kelham, near Newark, Notts, and William Arthur Cherry, Esq., of Andover, Hants, were elected Governors; and the following gentlemen Members of the Society:—

Wooldridge, Richard, Titchfield Park, Fareham, Hants.
Tancred, Sir Thomas, Bart., Brighton.
Lee, Peter, Winchester.
Read, John Offley Crewe, Laverton House, Milbrook, Southampton.
Parker, Thomas, Martyr-Worthy, near Winchester.
Savile, Albany B., Oaklands, Oakhampton, Devon.
Whitcombe, John Aubrey, Gloucester.
Helps, Richard, Gloucester.
Pipon, Captain Thomas, (Queen's Dragoon Guards), Langtons, Alresford, Hants.
Hall, George, Governor's House, Parkhurst, Isle of Wight.
Pryse, John B., Trefnanney Hall, Oswestry, Salop.
Urry, Barnabas, Newport, Isle of Wight.
Clayton, Henry, 21, Upper Park Place, Dorset Square, London

The names of 22 candidates for election at the next Meeting were then read.

American Seeds.—Mr. Colman, the Agricultural Commissioner from the United States, favoured the Council with the following account of the American seeds he had presented to the Council at the former meeting; and which had been distributed among 30 Members of the Council for trial, and their reports respectively on the results of their cultivation:—

"The *Millet* is cultivated both for its seeds and its use as Hay. I have never myself cultivated it for any other purpose than as Hay; and when well grown and cured, no fodder is more relished by cattle. Of its nutritive properties I have no doubt; but I do not know that it has, for this object, been subjected to any chemical analysis. It requires a rich, well-tilled soil. The advice is to sow a peck of seed to an acre; but the produce, in that case, is coarse. I advise a bushel to an acre, and the crop is much finer, stronger, and better. It is sown broadcast, as other Grass seed is sown. It is an annual. It should be sown in May, and the earlier the better. I have sown it on good land in May, at the rate of one bushel of seed to the acre; and having cut and well-made the Hay, have had the land cultivated, exactly measured, and the product weighed by a sworn measurer, at the public scales. The crop was at the rate of three tons of 2000 lbs. (which is our customary ton) per acre of as good fodder as I could place before my stock. In another case, when the crop of Grass was very short, I ploughed up a Clover ley, from which a crop of Clover had been taken, and sowed it with Millet, and obtained a very good crop, as well as I can remember, of more than a ton per acre. The Hay, however, in this case, was of the nature of rowen or second crop. If I could have had access to my Farm Journal, I could have given the exact amount in either case. I cannot see any reason why it may not be a good crop in England; though I will not say that it has preference over other Grasses already cultivated in England, and especially over the Italian Rye-grass, which I never saw until I came here, and of which, last year, I saw the surprising growth of thirteen feet in three successive cuttings, samples of each cutting being shown together.

"The *Broom Corn* (*Sorghum saccharatum*) is a plant much cultivated in New England for its brush or seed-head, which is used in the manufacture of brooms, especially for carpet-brooms. A good deal of this brush is imported into England, to be manufactured into brooms. It is a beautiful and hardy plant, an annual, but requiring in order to ripen its seed rather a long season. The average yield of seed is about 35 bushels per acre, and of brush about 700 lbs.; half a pound or more being the usual complement for a single broom. I have known more than 100 lbs. of seed obtained per acre—but this was a very extraordinary case—and 1000 lbs. of brush. The seed for feeding stock is estimated at two-thirds the value of Oats. By some of the best farmers in New England the blades and stalks are saved for feeding their young stock in winter, and the produce of an acre in this way is estimated as equal to a ton of Hay. I do not think that the plant can be ripened in England; but the brush, if gathered and dried in a green state, is deemed to make better brooms than when gathered in a perfectly dry and mature state. I am inclined to believe that to this state it may be grown in favourable situations in England; and if so, it would add to her useful products, and in the manufacture of brooms furnish much useful occupation. The Society will understand, however, that I express no strong confidence in the case. My knowledge of the average temperature of England would not justify me in doing that; but the experiment may be worth making, as it may be made in this case with little trouble and no expense. The customary way of sowing it is in drills 2 feet apart, and to drop the seed in the drills about 18 inches apart, putting 30 or more seeds in a place; and if it comes up well, allowing 8 or 10 plants to stand. It requires to be kept clean from weeds, and the land should be rich, dry, and friable, with a warm aspect. It is gathered by breaking off the stem bearing the brush about $2\frac{1}{2}$ feet from the top; and when it is well dried, the seed is scraped off, usually by a machine for that purpose, but it may be easily done by drawing it through a common Flax-comb or hatchel. The brush is then made into brooms, and the remainder of the plant gathered for fodder. Many farmers, however, in my opinion, with culpable improvidence, suffer it to lay waste, and when dry enough, burn it upon the ground.

"*The Herds-Grass or Timothy* (*Phleum pratense*), is certainly not unknown in England; but I have not seen it cultivated in those parts which I have visited. It is a hardy Grass, perennial, and, in good land, yields well; and, as Hay, ranks among the most valuable Grasses. It delights in a strong soil, and should be sowed at the rate of half a bushel or three pecks of seed to an acre. With us in the United States it is sown with Clover and Red-top, a species of Agrostis, mixed with it; but while the others pass away, this retains its place. I have known more than four tons obtained upon an acre; and in one case, 29 tons and a fraction, chiefly of Herds-grass, well made into Hay, were obtained from six acres in one season. The principal objection to it is that it does not return again as soon after it has been cut as other Grasses; but probably this is somewhat owing to very sparse sowing.

"Of the several kinds of *Indian Corn* (*Zea Mays*) which I present to the Society, I can have little hope of any of them being brought to maturity in England, unless peculiarly favoured by a warm season. The sweet Corn, with a shrivelled kernel, is deemed in the United States a most delicious vegetable, eaten in a green state; and so is the Tuscarora (so called from the tribe of Indians among whom the seed was first obtained), but they require a long season for ripening; yet they may be sufficiently advanced to be eaten green. In this case the ears are gathered when in the milk, and being boiled the grain is eaten from the cob with butter and salt. As it would be difficult for an Englishman to eat Oat-meal porridge with, if I may so express myself, a Scotch accent, it may be equally difficult for him to relish boiled Indian Corn as a new Englander would do; but I know no better vegetable. The Parker Corn, a large yellow ear, is an earlier variety than either of the two above mentioned, but the small yellow ear is a Canadian variety, and very early, coming to perfection in from 60 to 70 days. It is possible that this may succeed. This plant requires rich, warm land, strongly siliceous, and may be cultivated like the Broom Corn, in drills two and a half feet apart, and 18 inches apart in the drill, depositing five or six kernels in a place, covering it about an inch or two deep, and leaving about four plants to stand. The ground should be well enriched with manure spread, or the progress of the plant would be hastened by putting a small parcel of manure in the spot where the seeds are deposited, under them, and covering it before planting with a little of the soil. After that the ground requires to be kept clear of weeds, and occasionally stirred with a hoe. I am strongly inclined to believe that Indian Corn might be cultivated in the more southern parts of England as a crop to be fed to cattle and horses, green, as here Vetches are fed to them. No plant yields more stem and leaves, and no fodder can be better. With us it is often grown in this way for milch cows, and the quantity of green feed obtained is absolutely amazing. I have it on the most credible testimony, that 39 tons of green feed have been obtained in this way to an acre; and one gentleman, who measured a small parcel, has stated that much more could be obtained. This supposes the plant, however, to have arrived at nearly a perfect state. It may be cut to advantage a long time before this. I consider the experiment as well worthy of being made. In such case, I would advise it to be sowed on warm friable land, well manured, in drills, sprinkled quite thickly in the drills; the drills about 18 inches apart, and at the rate of more than a bushel per acre. It may be sowed early in April, judging from what I have seen of the climate of England, the present spring, and so on through May, or even later; and though its yield would be very much larger after it has come into blossom, and the ears are formed, yet it may be cut as wanted, when two and three feet high; and in general, this first cut, in such case, will start again, and yield a second cutting. No feed ever placed before cattle, according to its weight, is more nutritious and healthful. The Society will do me the justice to believe, that in presenting these seeds to them, I am not led away by any unreasonable presumption of their success; but simply from a conviction of the great value of the plants in my own country, and a hope that an experiment might result favourably, as it sometimes and often has happened, that valuable plants become naturalised by cultivation, to climates and localities very different from those where they are first found. In any event, I know that with that liberality which belongs to the intelligent and public-spirited everywhere, and nowhere more than in England, they will kindly appreciate even the most humble efforts to advance the highly useful and most important objects of their Association."

Turnip-Fly.—Mr. Beards, Agent to his Grace the Duke of Buckingham, communicated to the Council the result of his experience in the destruction of the Turnip-fly:—"The Turnip-sowing season is fast approaching, and with it, no doubt, that continual pest, the Turnip-fly, will also make its appearance, for the destruction of which, a great deal has been said and written, without much good resulting therefrom; for, during thirty-five years' experience in various districts, I have given fair and repeated trials to numerous recommendations for its destruction, without experiencing the effect sought, until eight years ago this season, being then engaged extensively in a Turnip district, when the insect began to make dreadful havoc on a fine plant, in a field of thirty-four acres. I then tried an experiment, which I had not before heard of, and which was simply as follows:—I took an old sack, had it ripped open into the form it was when cut from the roll of canvass, had it nailed to a pole, the thickness of a pitching-fork handle, leaving the pole about eight inches at each end, longer than the sacking. I then had one side smeared over with tar, made two men, one at each end of the pole, draw the sacking (the tarred side downwards), regularly over the field, letting it sweep the ground, carrying it at an angle of about forty-five degrees, fresh tarring with a brush every "bout," or oftener if required; on examination I found great numbers of flies sticking to the tarred sacking; I repeated the operation once a day, for four days, and saved the plant of Turnips. Since that time, when I have discovered flies on the plants, I have pursued the same plan, and have not, from that time till this, had occasion to plough up a single acre from the effects of the fly. I have several years past used gas-tar, in consequence of its leaving a stronger scent in passing over the plants than common tar, and which prevents the flies that are not caught from devouring the same; I do not mean to assert that once going over a field will prevent the destruction of a crop; it must be persevered in according to the strength of the fly, and the state the land is in. To force the plant into rough leaf, with good farming and this preventive, I do believe if a farmer lose his plant of Turnips by fly, it is in a great measure his own fault."

Mr. Jas. Sherring, farm-bailiff to Mr. Henning, Frome-House, Dorchester, Dorset, also favoured the Council with the following communication on the same subject:—"A great deal has been published, and many experiments tried, to prevent that ravenous of all other insects, the fly, from devouring that valuable root, the Turnip. After 20 years' experience with the greatest success, I beg to submit to your notice the following receipt:—A month at least before I begin sowing my Turnips, I purchase the different sorts of seeds I may require; I provide vessels for the reception of such, adding to every 20 lbs. of seed half-a-pint of linseed-oil, taking care to have it well mixed; I add 1 lb. of the flour of sulphur every morning, I have the whole rubbed between the hands to get the seed in a proper state for drilling; the drillman must be apprised of what seed he has to use, or he will not drill a sufficient quantity, as the sulphur will choke the cups; this of course must be looked to. As I before stated, I have practised this experiment for the last 20 years, without a single failure, and I believe I can safely say without losing a plant. The early part of last season the fly made great ravages in some parts of this country, but not one did I perceive in a field of my employers. For the benefit of those of my Agricultural friends that may be inclined to try the experiment, I lay the same before your most honourable Society, trusting it may be tried with the greatest success."

Colonel Challoner informed the Council of the uniform success which had attended his management of the Turnip-crop, since the year 1830, by the adoption of the following simple process in the manipulation of the seed, previously to sowing. He procured double the quantity of seed required, under ordinary circumstances, for a single sowing; one-half of this seed he steeped in diluted tank-water for 18 or 24 hours, and sowed it on the land in the usual way: in about a week afterwards he sowed the other half of the seed (which had undergone no preparation) over the same land. The result proved that, by this arrangement, a tendency to germinate one fortnight earlier was given to the Turnip-seed, by being thus previously steeped, over the remainder sown in its dry state, and the consequence was that a full crop of Turnips was uniformly secured; for if the soaked seed came up in dry weather, it was devoured by the fly, which being thus apparently satiated with the first supply of green food, was found to leave the succeeding plants arising from the dry seed untouched; if, on the contrary, the soaked seed came up in wet weather, it remained the standing crop, as the fly, from the uncongeniality of the atmosphere for its development, had not then made its appearance, and consequently reserved its ravages for the plants of the second sowing. Colonel Challoner had, by this simple but effectual application of the principle of early germination, found the means of preserving, in a natural and comparatively very economical manner, crops of Turnips varying from 50 to 70 acres in extent.

Mr. Woodword, of Little Comberton, near Pershore, Worcestershire, thought that every fact which increased our knowledge of the destruction effected by the Turnip-fly, and the circumstances under which its development and ravages were effected or retarded, was most important. He had, in his own case, experienced a most singular result in reference to this subject. He had last year prepared a field for Turnips, and brought the whole of it into the same state of cultivation; but having sown one-half of the field on the 1st of June, and the other half on the 2d of June, with the same seed, in the same condition, he had the surprise and mortification to find, without any obvious solution of the mystery, that the first sowing went, while the second only stood.

Milk Pans and Syphons.—Mr. Apsley Pellatt, of the Falcon Glass Works, Blackfriars, presented to the Council an English specimen of glass milk-pans, made at his own manufactory, of the strength and dimensions of those sent over to this country, at Sir John Lubbock's suggestion, by Captain Stanley Carr of Lübeck, but made of the ordinary transparent flint-glass, instead of the dark-coloured bottle-glass, which constituted the material of the German ones. He had already had half a dozen of them made for use at his own dairy at Knowle Green, and would report on their merits and advantages in due time. With regard to the price at which they could be supplied, under the present Excise restrictions, he found that, allowing a very moderate profit, they might be made at 5*s*. 6*d*. each, or for 5*s*. each, provided the order extended to a dozen to be made at one time.—Mr. Swinburne, director of the extensive glass-works of Messrs. Cookson, Cuthbert, & Co., of South-Shields, Durham, requested leave to inspect the model of Captain Carr's glass milk-pan, in order that they might, with the concurrence of the Society, take measures for manufacturing similar articles in England, at so low a price as to bring them within the means of ordinary farmers. Being himself an amateur farmer of 300 acres, he should have much interest in trying the glass milk-pans on an extensive scale in his own dairy; and would feel happy at all times to undertake the trial of any experiments or contrivances suggested by the Society in which glass might in any way be connected with agricultural convenience or improvement.

Mr. Henry Overman, of Weasenham, near Rougham, Norfolk, informed the Council, that he was not aware whether the use of milk trays made of lead was generally known among the dairy farmers of the country. He had reason to believe that so serviceable and economical a material might be very advantageously employed for that purpose, he himself not having heard any practical objection made against such trays by persons who had adopted them, either on the score of impurity from the metal, or on that of any chemical action which might

prevent the cream rising; and if they were furnished with a tap in the bottom, the milk might be drawn off from below, and the cream, instead of being skimmed off the surface, allowed thus to subside to the bottom of the trays and afterwards drawn off separately. In his own dairy of 30 cows, he used no other trays but leaden ones so constructed; and he had a model in preparation, which, if the Council would allow him, it would give him great pleasure to present to the Society.

Mr. Greaves, of Bakewell, Derbyshire, stated to the Council, that having paid a visit, some 20 years ago, to the dairy of the late Duchess of Rutland at Belvoir, he was much struck with the plan adopted for obtaining the cream without skimming it from the surface of the milk. The milk-room was lined with porcelain laid on in squares; and in order to preserve it cool and fresh, as well as to create a gradual ventilation, a fountain of cold water was kept constantly flowing in the middle of the dairy; the current rising through an upright pipe in the centre, and having attained its height, rolling back in sheets of water over a cone of successive basins, increasing in size from the top to the bottom, where the water entered a drain and was carried away. All the pancheons were of china-ware, and very shallow; it having, he believed, been satisfactorily ascertained, that the amount of cream thrown to the surface by a given quantity of milk was dependent to a certain extent on the breadth of surface given to it by such shallow vessels, the same measure of milk poured into a vessel, allowing it to stand at two inches deep, casting nearly twice as much cream as it would do if its depth were eight inches. In the experimental part of the dairy, the pancheons containing milk from various cows of the different breeds, were arranged in distinct order, and duly registered with every circumstance of condition supposed to affect the quality and quantity of the milk and cream obtained in each case; but the greater bulk of the milk was kept in leaden cisterns, about 3 feet long, 2 feet wide, and 3 inches deep, the bottom of each cistern inside having a slight concavity, in the centre of which was an aperture connected with a tap underneath, for the purpose of drawing off the milk, and leaving the cream behind untouched in the cistern. Mr. Greaves considered this to be on every account an admirable plan; and he had found in his own dairy, that a piece of saltpetre about the size of a hazel-nut, dissolved in warm water, and mixed with every gallon of new milk as soon as strained, not only caused the milk to cast its cream better, but had the effect of removing from it every disagreeable flavour arising from the herbage of particular pastures: such small addition to the milk of so well known and simple a saline substance, imparting to it a wholesome character, rather than otherwise, in a dietetic point of view.

Lord Camoys, of Stonor Park, Oxfordshire, stated, that while on a visit last winter with his friend Mr. Tollet of Betley Hall, Staffordshire, it occurred to him, on inspecting that gentleman's dairy, without being aware of the contrivance then brought under the notice of the Council, that the milk might with great ease and nicety be drawn off from beneath the cream on its surface by means of a syphon inserted into the milk over the edge of the pan. On his return home he carried out the idea; and having found the plan to answer perfectly, he now used nothing else but the syphon for separating the milk from the cream. The syphons were made of block-tin, with a tube of about a quarter of an inch bore, and cost two or three shillings each: one great advantage in their use was, that they were self-acting, merely requiring to be inserted in the milk and set at work, the stream continuing to flow by such decantation for about a quarter of an hour, until the cream presented itself for admission into the lower orifice of the tube, when its greater body and less fluidity prevented its free passage, and the syphon gradually stopped of its own accord. This complete draining of the milk from the cream, rendered the latter very superior in its keeping properties. His own dairy cows were Alderneys, and the cream therefore of greater body; but he believed the same effect of perfect separation would result in the case of ordinary cream, especially if the bore of the tube were diminished accordingly. —His Lordship, at the request of the Council, expressed his willingness to present a specimen of the syphons to the Society.

Pipe Tiles.—Mr. Read, of the Regent's Circus, Piccadilly, addressed to the Council the following statement connected with the cylindric tiles of small bore, referred to in various portions of the "Journal" of the Society: —"In consequence of numerous applications from gentlemen respecting the efficiency of the small pipe tile for surface-draining of clay lands, and whether the Tweeddale or horse-shoe tiles could be made with the new pipe-tile machine; in order to answer these questions satisfactorily to myself, in the beginning of March last I went through the counties of Surrey, Sussex, and the Weald of Kent, for the opinion of my old experienced draining companions, during the last 40 years. I have the satisfaction to find they have proved that the tiles of one-inch bore are sufficient if properly laid, and a free passage for the water at the end of the drain. Nay, more; some of the most experienced practical men are of opinion that a still further reduction in the size of the tile may yet be made. It is well known that the greater the declivity, the more rapidly the water will pass off. But there is a great portion of land nearly or quite level —as, for instance, the valley of the Medway, in Kent (and in almost every county in the kingdom); this land is of a deep, waxy loam, two or three feet deep, which, I have been told, cannot be drained; but I have found no difficulty in draining such land, where the channels could be kept open at the end of the ditches. If the drains were three feet deep and two rods apart, there would be three feet fall from the surface to the bottom of each drain in one rod from the centre between them. In such situations the telescope tiles may be used with good effect; for instance, suppose a field, 40 rods long, the upper end (or the 10 rods laid down with No. 4 tiles, of smallest bore), can receive but one-fourth of the water that must pass through at the lower end (or the 10 rods of No. 1 tiles, of largest bore). The pipe-tiles made by Mr. Clayton's new machine may be all brought into use in the same field; they may also be placed in half the compass in the kiln and carriage, and burnt with half the expense of fuel, &c.—N.B. These pipe-tiles are all made with separate dies, any size of which may be had, so as to give every person a choice of the size he prefers for his own use."

Mr. Woodward stated that with him the cylindric form of tile had not answered in Worcestershire, where he had drained 1000 acres up every furrow with tiles of that shape and two or three inches bore; the drains becoming stopped up, as he supposed, from the loose dust being washed by storms down the fissures, where the ground had cracked, into the drains below, where a puddle accumulated, which the force of the current was eventually insufficient to overcome.

Mr. Slaney had employed the small-bore cylindric tile with signal success on his estate in Shropshire. His pipe-tiles varied from 2½ to 1½ inches in width, and had run quite clear after two or three years' use. He believed that a great deal depended upon the mode of filling-in drains; and referred to the papers in the Society's Journal on that point. By allowing the clay to crack, and then filling-in with a proper material permeable to the water, he conceived that the finest natural sieve was obtained to prevent future stoppage. His mode was to cut the drains three feet deep, and cover them over with the clay to the depth of about three inches, allowing such bed of clay to crack into fissures before proceeding further; when the clay had cracked, he then filled in the drains as he had just stated. He had employed the draining-plough, introduced by Mr. Law Hodges into the Weald of Kent, with great success. —Colonel Challoner thought green-sod turf formed the best material for filling-in drains. It was not, however, always at hand. He hoped at some future time the subject of draining sandy soils, to which he had on a former occasion called the attention of the Council, would engage the serious consideration of the Society. He considered that part of the general question of draining to be the one at the present time the least understood, and to which practical attention had not yet been sufficiently drawn. We were well informed on every point connected with strong land draining, but knew nothing of the draining of sandy land.

Bones and Guano on Waste-Land.—Sir Charles Lemon, Bart., M.P., called the attention of the Council to the following facts, adduced by Mr. Karkeek of Truro, in his prize essay read before the Cornwall Agricultural Association, connected with results obtained from the use of bones and guano on the very poorest waste-lands of that county.

Bone-dust.—In 1835, Carnwinick farm was a barren waste, heath and furze being the only covering of the soil; let at two shillings per acre: north-west aspect, and clay-slate soil of loamy character. Experiment I. A common field was broken up, and the larger portion manured with bone-dust at the rate of 3 quarters to the acre; the other portion being merely dressed with the ashes obtained from the breaking and burning of the land. The Turnip crop was completely carried off by the fly. In the years 1836 and 1837, it was cropped with Oats, and then laid down to permanent pasture. There was more than double the quantity of Oats on that portion where the bones had been applied, and at the present time their effect can be plainly distinguished as if a line of demarcation had been drawn between rich and scanty herbage, or between a green meadow and uncultivated land. Experiment II.—In 1836, another piece of the waste was broken, which was sown to Oats, and on the following year a similar crop was taken. One portion of the field was manured with bone-dust only. The Oats on this part were equal to those in the first experiment. After this the whole was laid down to pasture; and at the present date the line of distinction can be plainly seen where the bones were applied, at more than four miles' distance. The same beneficial effect is also plainly seen in two larger patches, broken up in 1837 and 1838. They have been sown with Turnips, and manured with bone-dust only, which produced most excellent crops; after which, a crop of Oats was taken; it was then pastured up to the present time. In another piece of about six acres, which was broken in 1839, and sown with Swede Turnips, an excellent crop was produced; since which other crops have been taken, and the Clover very luxuriant, the land being equal to that let at 40*s.* per acre. In 1840 another piece was broken and sown to Turnips, with bone-dust as before, and Oats in the following year; both crops were excellent. In November 1841 it was ploughed once only, and without any other cultivation sown to Turnips in June 1842. This crop was also good, and in Mr. Karkeek's opinion plainly proved that Turnips after grain may be produced without either spring or summer ploughing. In 1841 another large portion was broken, sown with Swedes, and afterwards cropped with Oats, using the bone-manure only, which answered as well as before. From the year 1835 to the present time Mr. Trethewy had thus successfully broken and cultivated patches of waste to the extent of 60 acres. His usual method of cropping had been, first Turnips, then Oats, seeds, and permanent pasture. In 1842 Mr. Karkeek witnessed a crop of Swedes on this improved waste land, which he considered as decidedly the finest crop of the kind grown in the parish that season.

(To be continued.)

ROYAL AGRICULTURAL IMPROVEMENT SOCIETY OF IRELAND.

At the late Half-Yearly General Meeting of this Society, the Secretary read the Annual Report of the Council for 1843, from which it appears that the funds of the Society, and the number of its annual members, have progressively increased since its first formation. The number of annual members who paid their subscriptions during the past year amounted to 581, from whom the sum of 997*l.* 6*s.* was received. By an original rule of the Society, all the donations, which now amount to 4859*l.*, have been strictly funded, and will continue so to be, in the names of the trustees, the interest alone and the annual subscriptions being applied to the general objects of the Society. These latter sums, together with the balance from year to year, and the sum of 500*l.*, hitherto received from the locality, on account of the Cattle Show, constitute the available annual income of the Society, and are vested in the finance committee, for the general purposes of distribution. The funds at the disposal of the Society, for 1843, amounted to 1338*l.* 1*s.* 8*d.* The most gratifying feature in the proceedings of the Society, is the progress that has been made in the formation of local farming societies in communication with the central one. In the year 1841 there were only 23 of these local bodies in existence; in the year ending December, 1842, they had increased to 50; in the year ending December, 1843, they amounted to 80; and now there are no less than 100 of them in connection with the central Society, and the applications are still increasing. This increase has been most gratifying, particularly when we consider the vast benefit which these local institutions have afforded in carrying out the original views and objects of the central body, and in enlisting the co-operation and support of the farming classes. In the two former years it was the custom to divide the premiums equally between husbandry and stock; but it was found that the prizes given for stock were only duplicates or repetitions of the same premiums given by the local societies themselves. In consideration, therefore, that as more than half the available funds of the Society were distributed in premiums for the encouragement of stock, at the Society's annual Cattle Show, the Council thought it more desirable to confine their premiums in local Societies to purposes of husbandry alone, and to leave the stock premiums to be furnished by the local funds, according to the circumstances of each particular locality. This arrangement has enabled the Society to devote a larger proportion of its funds towards encouraging an improved system of husbandry in the local societies in connection with it.

At the last weekly meeting of this Society, Mr. Smith, of Deanston, attended the Council on his return from Sir Richard O'Donnell's, of Newport House, in the county of Mayo, and stated that he had just completed his tour of inspection of the lands of the different competitors selected for the Society's Gold Medal, for the greatest quantity of thorough-draining in Ireland—that he had examined the different localities most attentively, and had taken notes carefully of the work done, and of the circumstances connected with each particular operation, which he would embody in his report, to be laid before the Council at the earliest opportunity—that his visit through Ireland was a most agreeable one to him, as he saw evident marks of industry and improvement in every quarter of the country—that Sir Richard O'Donnell deserved great credit for the example he had set in that remote but interesting part of the country; for even already were the small farmers beginning to imitate him, and it was pleasing to see the operation of thorough-draining rapidly extending up the sides of the hills, and through the moors in the west of Ireland. The quantity of employment thus afforded to the labouring classes was incredible; and, in most cases, where the landlord paid the small tenantry by task-work, at the rate of twopence per perch, they seized on it greedily, as they calculated that it would benefit their land more than double that amount eventually.

AGRICULTURAL CHEMISTRY ASSOCIATION.

On Wednesday the 24th ult., Professor Johnston delivered a public address in the Museum of the Highland Society, On the Improvement of some of the Counties where Lectures have been given, and on the Results of Investigations of Soils, Manures, and Guanos, in the Laboratory of the Association. He began by reminding the meeting that the Association had two objects in view,—to diffuse knowledge in Agricultural Chemistry, and to add to that knowledge by investigations in the laboratory. In pursuance of the first of these objects, he had visited a great many districts in Scotland, and delivered lectures there to farmers. Another means which the committee of management expected of great service in diffusing knowledge was through the press. There were now six periodicals in circulation, and two others had just commenced. A third mode which the committee adopted for furthering the objects of the Association, was to secure the aid of the schools. Much had been done in Ireland in this respect—the study of Agriculture having been introduced into the national schools of that country. In Ayrshire, also, much had been done. Being applied to by the farmers there, he had written an elementary book for the schools, and the subject was now introduced into the schools of Ayrshire and of the adjoining counties. From all these circumstances—the lectures, periodicals, and schools—it could easily be inferred that great desire

had been excited to obtain the information which it was the wish and object of the Association to spread over the country. The learned Professor then referred to a remark by Mr. Pusey, in regard to the cultivation of Scotland, which appeared in the journal of that Society:—"I cannot (says Mr. Pusey) place the general farming of Southern Scotland or of Northumberland on a level with the farming of our southern counties, such as Buckinghamshire, but rather with that of North Devon; nor the general farming of East Lothian on a level with the general farming of Lincolnshire; nor the best farming of East Lothian on a level with the best farming of Lincolnshire, because it is the best land only of East Lothian on which such noble examples of farming are given, while in Lincolnshire the barren heath and wold have been taught nearly equal luxuriance." Mr. Pusey's opinion was not so complimentary as might have been anticipated; but the reason he had assigned was good, for in Scotland the excellence of cultivation diminished in proportion as you approached the interior; as, for example, land brought only 1*l.* per acre at the Lammermoor hills. When he first visited Scotland he entertained an opinion similar to that which he believed had formerly been entertained by Mr. Pusey. In some parts of Scotland farming was in as high a degree of excellence as in any part of the world, but still a great deal remained to be done which had hitherto been neglected. In passing from Edinburgh to Lanark, the quantity of uncultivated land was enormous, and between Lanark and Glasgow there were great tracts in the same state, which, if put under the care of a skilful East Lothian farmer, would yield a greatly increased return. There were also several straths throughout the country lying uncultivated, which were as good land as much of that which had undergone cultivation. In passing from Edinburgh to Lanark, and thence to Glasgow, he had observed that want of draining was most conspicuous. The cultivation of this land was objected to on the ground that the climate was so very bad that no remunerating prices could be obtained. But draining would improve the climate. There were two objections to deep draining, viz., the expense and the imperfect drawing of the drains. In regard to the expense, he knew that in Roxburghshire deep drains had been adopted, and in three years the capital was returned; very rarely it required five years to do so; and, besides, the land was permanently improved. In reference to the drawing of the drains, he might state that in a recent Number of the *Royal Agricultural Journal*, a gentleman, who had drains three feet deep and puddled at the top, offered a reward to any one who would keep the water out. As to the effects of draining, by looking at the geological map to the tract of country up the Frith to Crieff and Strathearn, and to the east over Kinross and Fifeshire, Grass-land was seen which was covered over with Moss. Now, practical agriculturists were aware that, in order to extirpate Moss, they applied lime. But it was impossible to overcome thoroughly this difficulty, unless the climate were ameliorated. Deep ploughing was another great means of improving much of the land he had seen, rendering crops much more prolific. In many parts of the Highlands certain geological deposits were found, such as mixtures of gravel and sand, leaving only a small quantity of soil on the surface. This existed always on the hill sides in the straths. It was the practice not to tear up the stones beneath the soil, but simply to plough the thin surface covering it; and he believed that if the subsoil plough was applied, and the stones ploughed up, the land would be improved. Gentlemen in the neighbourhood of Stirling had taken up stones as deep as 10 or 14 inches, and the increase compared with former crops was enormous. He had been told by a farmer, in the neighbourhood of Edinburgh, that the dung had gradually sunk into his land far beyond the reach of the plough; and, on having recourse to deep ploughing, he was astonished at bringing to the surface whole deposits of town dung which had accumulated for generations, and which of course increased his crops greatly.

He would now pass to the second object which the Association had in view—the increase of knowledge by investigation in the laboratory; time, however, would not permit him to detail one-tenth part of what had been done. He had received some soils from Sir George Macpherson Grant, for the purpose of inquiring into what was generally called overliming the land. Overlimed land produced Barley and Turnips, but not Oats. In order to clear up the mystery, whether this arose from overliming, Sir George had sent him six soils to be examined. Thirty years ago these soils had produced very good crops, but since then they had failed to produce anything except Barley and Turnips. The result of this investigation was, that the soil being unfit for Oats did not arise from the presence of too much lime. If it was kept in view that Barley required a light soil, and that Clover and Oats required a soil close and stiff, it would be admitted that it was not the chemical constitution but the mechanical condition of the land that was at fault, and that a remedy was to be found in the application of some heavy instrument to compress the soil, so that the roots of the plant might get that close soil which it required. He would caution all farmers against using large doses of lime at once on such land, and before it was drained; perhaps, also, it might in many cases be better to put on lime in the shape of compost. Mr. Proudfoot, of Pinkiehill, had a field which, 60 years ago, was a moor, and which, having been drained and limed for four rotations, where the land was still marshy, Turnips exhibited a peculiar disease, the rest of the field being pretty good. There was a large fungus or wart that gradually reached the head of the Turnip, and destroyed it. On examining the soil, he (Mr. Johnston) found the composition of the Turnip and of the soil itself to be as follows:—

Comparison of Ashes of Swedish Turnips and the Soil in which they were grown.

	Turnips.	Soil.
Chloride of potassium	4 42	0.02
Sulphate of potash	31.37	0.87
Phosphate of ditto	5.72	..
Carbonate of ditto	24 39	0.11
Phosphate of magnesia	1 05	..
Ditto of alumina	6 06	6.45
Ditto of iron	..	..
Ditto of lime	2.64	..
Alumina	..	..
Carbonate of lime	10 97	0.29
Oxide of manganese	8.70	0.22
Silica	1.32	78.29
Organic matter	..	6.24
Water	..	6.61
	96.64	99.10

By looking to the carbonate of lime, it would be seen that in the ash there was upwards of ten per cent., while in the soil itself there was less than one-third per cent. The soil had also as large a quantity of manganese as of lime, and to this circumstance he attributed the cause of the disease. In order to remove noxious substances from the subsoil, the best way was to drain even when there was no spring water, because the rain washed out and carried away any of those noxious ingredients in the subsoil, which did great mischief to the plant. He had been making several investigations in regard to the failure of the Potato crop, but he had not yet been able to come to a conclusion as to the cause. He then referred to those gravelly or ochrey masses which formed one, two, or three feet below the surface, and were an impervious impediment through which no water could penetrate, and to which the roots of plants loathed to come. Besides these, there were other formations of the same kind; they were very thin layers, and formed like cups. It was impossible to improve such land, without breaking the pans. In many districts marl was to be found in great abundance while lime was scarce, and it was therefore of importance to know the relative value and qualities of the two, in order that farmers might judge which would be the most useful and economical for their individual use. Upon this subject he had drawn up a table, of which the following is a copy:—

Composition of Marls.	Banks of the Boyne.		Caithness.		Logie Marl.		
			Wet.	Dry.	Wet.	Dry.	Brd.
Water	1.5	2.0	45.04	....	62.50	....	..
Organic matter	1.4	1.0	2.57	4.49	5.42	14.61	1.0
Carbonate of lime	92.2	10.7	46 56	84.71	28.76	77.50	82.2
Do. of magnesia	1.1	0.0	0.0	0.0	0.0	0 0	0.0
Gypsum	0.0	0.0	0.0	0.0	0 0	0.0	8.0
Alumina and earthy matter	3.1	85.1	6.04	11.29	2.90	7.81	7.5
	99.3	98.9	99.15	100.45	96 58	99 98	98.7

One of the kinds in this table from the Boyne was best for heavy soils, and another for such as were light. It was of great importance to get marl in a dry state, in order to save the expense of conveyance. It was also advisable at times to mix it with quicklime. In regard to steeping seeds, he had no doubt that every kind of seed grown would be greatly benefitted, and he had drawn out a table which he thought contained all the elements which a steep for Grain ought to contain:—

Steep for Corn and Beans.

Phosphate of soda, Sulphate of magnesia, Nitrate of potash, Common salt, } 1 lb. of each in 10 gallons of water to steep 300 lbs. of seed.

Sal ammoniac, or Sulphate of ammonia, } To be dried with gypsum or quicklime.

After referring to the great loss which the Association had experienced by the death of Mr. Oliver, of Lochend, the learned Professor concluded his address.

CIRENCESTER AGRICULTURAL COLLEGE.

AN influential meeting was held on the 29th ult., at Cirencester, Gloucestershire, in furtherance of a plan recently projected for the establishment of an Agricultural College and Example Farm. Many of the first agriculturists of the Cotswold district were present, both landlords and tenants, amongst whom were Earl Bathurst, Lord Sherborne, Earl Ducie, Ambrose Goddard, Esq., T. H. S. Sotheron, Esq., M.P., Sir J. Paull, D. Ricardo, Esq., Professor Daubeny, and many others. Lord Bathurst took the chair, and Mr. Brown, of Cirencester, to whose exertions, his lordship stated, it was chiefly owing that the scheme had reached its present position, read the Report of the committee of the Cirencester and Fairford Farmers' Club, which had been appointed to carry out resolutions passed by that Club last year, on the subject of Agricultural education. The report, which detailed the reasons which had actuated this Society in taking measures for the establishment of an Agricultural School, and which specified the circumstances on which the success of the scheme depended, having been read, the Earl of Ducie rose to propose the first resolution, which referred to the propriety of establishing an Agricultural College. His Lordship said, that upon the subject of education a great change had taken place in opinion within a few years; the farmers had begun to see more clearly than before—at least such of them as had sons—the necessity for establishing an institution like the one proposed. He did not suppose that there were any agriculturists present, who did not contemplate that one or two of their sons should follow farming as a profession. But how did they propose to get them educated? At present they were compelled to send them to school, where they, no doubt, learned much that was useful, but not in the line of life in which they were destined to work their way in the world; the only opportunity they had of teaching them their business, was when they returned home from school, perhaps at 14 or 15 years of age; farmers then instructed them in what they knew themselves, or, it might be, placed them, with a large premium, with some neighbouring agriculturist, of whose practical and scientific knowledge they entertained a higher opinion than of their own. But no man could teach more than he knew himself; the person to whom they sent their sons might know a great deal—he might be a good farmer and breeder of stock—but still unable to communicate the degree of scientific knowledge which is necessary for the successful prosecution of Agriculture; and although a farmer qualified in all respects might be found, was it to be supposed that he could accommodate as many pupils as required his instruction? In all points of view, therefore, it was necessary that they should support this college, which would afford them an opportunity of giving their sons a sound practical education on all subjects relating to their occupation.—Mr. Kearsey, tenant-farmer, of Tarlton, seconded the resolution. He sincerely hoped that an institution which was calculated to be so extensively useful would meet with the necessary support: if it did, he was sure that those who came after would be grateful to them for their exertions.—Sir John Paull moved the second resolution, which named a committee to determine on the plan of a suitable educational institution, and to carry the design into effect. He said it frequently appeared to him as a most remarkable circumstance, that farming was the only thing which was supposed to come without education. If a young man were put to any other trade, either ironmonger, grocer, lawyer, or surgeon, it was deemed requisite that he should be trained to that particular vocation in which he was to exercise his talent; but a man hesitated not to take a farm without previous instruction, presuming that, being the son of a farmer, it must, as a matter of course, follow that he can be a farmer likewise.—The resolution having been seconded, Dr. Daubeny, Professor of Rural Economy at Oxford, rose to propose the third resolution, that a subscription be entered into to defray expenses. During his travels on the Continent, he had visited several colleges in France, Germany, and Italy, established by the respective Governments for the instruction of youths intended for Agriculture, and from their general distribution was led to infer that the necessity of imparting an education to young farmers adapted for their future occupation, was felt in every other civilised country in Europe. He moreover observed, that in several of these colleges young Englishmen were found, proving that the want of some institution of this kind was felt also among ourselves. He had even been applied to by strangers with respect to the regulations and terms of admission to some of these colleges, and particularly by one person, who was anxious to learn whether any and what provisions for the religious instruction of a Protestant existed in the Agricultural College of Grignon, near Paris; a circumstance showing that misgivings were entertained by parents on that head, in sending their sons to a foreign Agricultural College, which might be removed by the establishment of one at home. Since, then, a demand for the kind of instruction which may be imparted at such an establishment exists both here and elsewhere, is there anything in the circumstances of this country which forbids us supplying it? Is there not, on the contrary, a stronger reason for giving to British farmers a good education than exists elsewhere? This was not the place for any political discussion; but those who, like himself, cherished the hope of seeing the population of the country mainly supplied with the necessaries of life from its own soil, must of necessity assume that the latter can be rendered capable of yielding a much larger produce than it does at present; for as the population is increasing at the rate, it is said, of about 700 a day, the produce of the soil must go on increasing in an equally rapid ratio, if we are to continue to depend upon our internal resources for food. But as the industry of the nation is already taxed to its utmost, this increase can only be obtained by increasing skill, increasing intelligence, increasing knowledge on the part of the cultivator. The farmer might in this respect take a lesson from the manufacturer, who, though it is acknowledged that in point of mechanical skill Great Britain takes the lead of all other nations in the world, is so far from imagining that he is arrived at perfection, that he is constantly aiming at improving his machinery and his processes; whilst the farmer, who in some districts has gone on from time immemorial on the system of his forefathers, fondly imagines that there is no further room for advancement. It is not expected, however, that by the foundation of the proposed College, every farmer should be rendered a practical chemist, or capable of originating discoveries; but that in each agricultural district there should be a few persons capable of suggesting improvements, whilst the great majority should at least be sufficiently well informed to understand the principles upon which the approved practices in husbandry are founded, and the conditions on which they depend for their success. Thus, for instance, if the plan of preserving the liquid manure be introduced in a given district, it should be understood by the farmers who adopt it, what elements it imparts to the soil, how these elements may be best prevented from escaping, and why their loss is so injurious. The professor concluded by expressing his satisfaction, that the first Agricultural College in South Britain should have been projected by the inhabitants of a town and neighbourhood in which, from early associations, he felt a personal and lively interest, and confessed that he entertained a stronger desire to see the institution established on this account, than for the sake, even of the great cause

involved, being convinced, from all that he had heard and seen, that such a demand exists for education among the farming classes generally, that means will be provided in some part of the country or other for supplying it; so that the principal question is, whether Cirencester shall have the credit of taking the lead in this great movement, or whether it will be left in the background by other places in the kingdom.—Mr. Lawrence, solicitor, seconded the resolution. He entertained the opinion that this country was capable of producing the muscle, bone, and even the fat of all her Majesty's subjects, if it were properly cultivated: and, looking at the great increase which was taking place in the population, he must say, if he might use the expression without profaneness, that God never sent mouths without food to put into them, and he was inclined to think that the finger of Providence directed the exertions which were now making to supply food for the increasing population. All were interested in the question—manufacturers among the rest—for if they would look at the immense proportion of their productions which was consumed at home, in comparison with what was exported abroad, they would see that they had an equal interest in increasing the productiveness of the land. He himself was no farmer, nor did he own land worth speaking of; but he felt strongly the advantage of promoting agricultural improvement. He believed that if the proposed institution were supported by the farmers generally, there need be no fear of assistance from the owners of the soil; and he did hope, after the meeting of this day, that no difficulty would be found in raising the funds. Some individuals had asked the rate of interest which was to be allowed; but he had to state that those persons who were looking for interest must go into the various stock-exchanges, both British and foreign, where they would find ample investments for their money, and not look to the proposed institution as likely to serve their purpose, for he hoped that its supporters would not bestow one thought on the question of interest. He should invest his money with purer motives, and feel that in doing so he was advancing the prosperity of agriculture, which interest he believed to be the chief and most important of all others to the country at large, and should consider that it was yielding him greater interest than he had ever received from any other investment. After thanking Lord Bathurst for his kindness in taking the chair, the meeting separated.—*Abridged from Cirencester Paper.*

FARMERS' CLUBS.

Probus.—At the monthly meeting of this Society, a lecture was delivered by Mr. Whitley, of Truro, On the Practical Importance of Geology to the Agriculturist. Mr. Whitley said, that the physical features of a country, its productions, and the employments of its inhabitants, were influenced by its geological structure. To know more of the causes which produced these effects was therefore desirable, in order that the resources of a country might be developed, and its industry directed into useful channels. Soil is generally derived from the geological formation on which it rests; and thus the various formations have different and peculiar soils resting on them, agreeing in composition with the rock beneath, being good or bad in their texture, according as the rock has a tendency to crumble into a gritty or clayey state. A knowledge of the nature and properties of soils is requisite, in order that the farmer may raise the greatest amount of valuable produce at the least possible expense, and in such a manner as not to impoverish the land. This knowledge may be obtained by chemical analysis, but this is a difficult and expensive process. But Geology affords essential aid in this respect. Soil being derived from the rock beneath it, if we have an analysis of the parent rock, we shall have a very near approximation to the mineral composition of the soil. Thus, while the chemist is spending hours in his laboratory in delicate and intricate researches, a geologist infers at once that a granite soil contains much potash—that the soil on the serpentine contains a large amount of magnesia and iron—that soils on greenstone, hornblende-slate, and sienite, are rich in the inorganic food of plants, &c. &c. Geology will, in fact, give such a general insight into the composition of the soil, that its capabilities may be understood, and directed into the channel most profitable for the farmer.—*The West Briton.*

Chepstow.—The following is extracted from a paper, by an anonymous writer, read at the last meeting of this club:—"I have had some experience in growing Turnips. The first thing to be considered is the fallow; for without a clean fallow, thoroughly pulverised and properly manured, a crop cannot be expected. The deep ploughing before winter should never be omitted, and after it is completed, the hedges round the field should be kept in good order, and the gates locked, to prevent stock of all kinds from treading it in wet weather. The land thus treated will be thoroughly pulverised by the action of the frost; and in cross-ploughing the land in the spring, it should be stirred as deep as the previous ploughing. If stirred any deeper it will cause a bad tilth; because the fresh land brought up, when exposed to the sun and wind, will bake into clods. Though I am speaking particularly of our stiff limestone-land, yet soils of all kinds would be improved by having a deep furrow before winter. With regard to manures, the only artificial one I have tried is bone-dust. In 1840, I drilled 6 quarters of neat bones on 2 acres, sown with white globe Turnips; the field was 6 acres, and the crop by no means a good one. In 1841 I sowed a field of Swedes, and manured it with 2 quarters of bones and 2 quarters of soot per acre. This was nearly a failure; as, wherever the soot came in contact with it, the seed died. In 1842 I sowed a field of Swedes; the manure was bones and coal-ashes, over three-fourths of the field, at the rate of 4 quarters to the acre. I divided the field into four parts of 2 acres each:—

To lot No. 1,—3 quarters bones and 1 quarter ashes.
" No. 2,—2 " bones and 2 " ashes.
" No. 3,—1 " bones and 3 " ashes.
" No. 4,—3 " ashes, per acre.

The crop on No. 1 was very strong, and the leaf luxuriant. No. 2 was a heavier crop with a small top. No. 3 was not far short in weight of No. 2. No. 4 was not a quarter of a crop. The field was drilled the first week in June. From what I have stated you will perceive there was a waste of bones in No. 1; and that if the bones had been equally divided over the field, there would have been an even and a good crop. I think coal ashes mixed with bones is better than bones alone. Two quarters of bones and two quarters of coal ashes will grow a better crop than four quarters of neat bones. The bones and ashes should be mixed 36 hours previous to sowing, because the mixture gets into a high state of fermentation, and when drilled it decomposes very fast, and causes a much more rapid growth of the plants than if sown in a dry state. The next thing to be considered is seed. Every farmer should prove his seed by putting 40 seeds into a pot, and covering them one inch deep with fine mould; should they all vegetate, 2 lbs. per acre would do; but if one fourth fail, which is often the case, then 2½ lbs., and so on. Mr. Coke, the late Earl of Leicester, made it a rule to drill 3 lbs. of good seed per acre, and his crop never failed. He used to say there was plenty for the fly, plenty to hoe, and plenty for a crop. Mr. C. Blunt says, the best time to sow Swedes is from the last week in May to the middle of June. In 1842 I sowed three drills on the 5th of May, and the rest of the field the first week in June, and there was more weight of Swedes on these three drills than on nine of the others. The manure was twelve loads of dung to the acre, ploughed in before Christmas. Last year I repeated the same experiment on the same dates, and the whole of this field was a good crop, but the three May drills were double the weight of those sown in June: the manure the same as for the first trial. It should be borne in mind that a Swede is a much slower growing plant than a common Turnip; the latter will grow as much in one month as the former will in two. In the report of the Monmouth Farmer's Club for 1843, at page 34, we read of a liquid mixture applied to the soil as a manure for Turnips, but I do not approve of the plan of application there suggested; it is a broad-cast application of manure, and a drill system with the seed. If farmers would take the trouble to collect the urine made by the stock that is housed in the winter months, they would be able to let the bones remain quiet in their graves.

Northamptonshire.—At a late meeting of the Agricultural Book Club of this county, it was resolved that the best methods of improving the condition of the English agricultural labourers are by establishing and encouraging, in every village, daily and Sunday schools for useful and religious education; by promoting the establishment of clubs upon a sound and permanent basis, for providing funds, clothing, &c., for the relief of the sick and superannuated; by procuring cottage gardens, not exceeding one rood of good land, as near as possible to the residence of the occupier; by providing them with comfortable cottages, containing not less than two bedrooms; by paying the labourers weekly on a Friday, instead of Saturday, thereby giving them an opportunity of laying out their earnings to the best advantage; by adopting every possible means of giving constant employment to the agricultural labourers throughout the year, and of paying them according to the work performed, and not according to their necessities; by pressing upon the attention of the members, composed of landlords, land agents, and tenant farmers, the importance of carrying out the spirit of the 6th Resolution; by devising means of increasing labour in such a manner as will secure to the employer a return equivalent to the additional outlay, without which the occupier cannot afford the expense consequent upon such increase of labour.

Rebiews.

The Farmer. Compiled by George Nicholls, Esq. Charles Knight and Co.

THIS work details in very simple language the practice of the farmer on the subjects which successively engage his attention during the course of the year. It was written with the view of being useful to small farmers, by placing before them, in a simple and condensed form, the results of a wider experience, and of a larger amount of scientific research than they would else, probably, have the means of access to. A similar compilation by the same author has been extensively circulated in Ireland, and has been useful there in stimulating to the adoption of improved methods of cultivating land; and the present work is well calculated to produce similar results in England.

We are often asked to recommend simple and yet complete works on Agriculture, suitable for small farmers; in future, we shall answer all such inquiries by referring our correspondents to Mr. Nicholls's compilation, "The Farmer." We cannot give a better specimen of the style and general character of this work, and at the same time be more seasonably useful to our readers, than by quoting the following passage on the Artificial Grasses:—

"*The Artificial Grasses.*—No farming can be well conducted, in which the artificial Grasses are not cultivated; for without them there cannot be a proper rotation of crops, nor the requisite supply of manure for the land. Clover and Rye-grass are the chief artificial Grasses in use in British husbandry. They require the land to be in good condition, and are generally sown with the corn crop immediately following a fallow crop of Turnips, Potatoes, or Mangel-wurzel. In choosing Clover seed, be careful that it is clean, and not mixed with other seeds, which may afterwards spring up and become troublesome weeds. The sorts of red, white, and yellow Clover seed, may be easily distinguished from each other. The two latter are perennial pasture Grasses, and the red Clover is biennial and grows tall and luxuriant. Of Rye-grass there are two sorts—the Italian, and the common perennial kind, and there is no certain mark by which they can be distinguished. The farmer ought, therefore, to purchase his seed from a respectable dealer, in order to guard against mistakes in this respect. When the ley is only intended to stand two or three years, the Italian Rye-grass is preferable, from its giving a more abundant crop than the common variety; but the latter should chiefly be sown for permanent pasture.

"When land is to be sown for permanent pasture, with white Clover and Rye grass, the quantity of seed will vary a little, according to the condition and quality of the land, poor soil requiring most seed. White Clover should only be sown in land intended for permanent pasture, for which it is well adapted; but it is wasteful to introduce it into alternate cultivation. The red Clover is not adapted for permanent pasture, although in its proper place, and for soiling purposes, it is decidedly the best plant in alternate husbandry, and its growth cannot be too extensively encouraged. The yellow Clover, or Trefoil, is more permanent than the red, but not so much so as the white, neither is it so much relished by cattle. Grass and Clover seeds are occasionally sown with all sorts of grain crops, but they succeed best with Barley. In high situations, where neither Wheat nor Barley prosper, they may be sown with Oats. The state of the weather, of the ground, and the mode of sowing, all influence the successful vegetation of the crop. A rough uneven surface will require a greater quantity of seed than a finely pulverised soil. If the weather is wet at the time of rolling in the seeds, they will be apt to adhere to the roller. Calm weather should be selected, if possible, for the sowing of these seeds; and the time of sowing must be regulated by that of the crops along with which they are sown, or any time in March, April, or May. The white Clover and common perennial Rye-grass, judiciously intermixed and properly cultivated, will ever rank high as a nutritive and wholesome herbage. Through the agency of these Grasses, extensive tracts of land have been converted into rich pasture, and the produce of the dairy has thereby been greatly augmented. Lime is the manure which has chiefly been used, and its application has improved the soil and adapted it to the habits of the plants, and the land has become progressively enriched. Indeed, in the improvement of waste land, and as a preparation for pasturage of white Clover and Rye-grass, the most liberal application of other manure will not always insure their successful growth, without the application of lime. Surface applications are now largely used around Edinburgh, for procuring crops of white Clover and Rye-grass. Soot is applied to a great extent, and has uniformly the effect of forwarding the crop. Liquid manures are also extensively used, and urine is collected with great care, for the purpose of being applied to the soil. Liquid manures are much more lasting in their effects than soot, and seem better adapted for Clover. Saltpetre is likewise used occasionally, and forms an excellent top dressing for seeding Grasses. It is by the judicious use of such means as these, that the agriculturists of the Netherlands have been able to obtain abundant crops, and to keep up the fertility of their lands during so long a period.

"When perennial Grasses are fed or cropped very close in autumn, they do not rise with such a vigorous growth in spring, owing to the removal of that part of the stalk which would have afforded sap for the first nourishment of the Grass; and even in spring, when the first shoots are fed very close, the Grass does not again grow so vigorously, and is found to yield a considerably less produce during the season than when it is allowed to attain a good growth before it is eaten, and then is not eaten too close."

Lectures on the Theory of Agriculture, and on the Practices of Farming adopted in Cheshire. By Albert J. Bernays. Roberts and Powlson, Manchester.

THESE lectures were lately delivered by Mr. Bernays, at Siddington, in Cheshire, to the tenants of Mr. Davenport's estate. They are well calculated to impart a knowledge of the theory of cultivation, and of manures, to those who are unacquainted with the science of chemistry.

Miscellaneous.

Connection between Chemistry and Agriculture.—I have noticed with regret that almost all the popular works hitherto written upon agricultural science have fallen into the one common error of endeavouring to make a chemist of the practical farmer; the authors all seem to think it necessary that, in order to the improvement of Agriculture, every farmer must study chemistry. In this respect, however, I hold a totally different opinion. It appears to me that it would be a precisely analogous case, if writers on climate had said that, in order to preserve health, it were absolutely necessary that every individual should study medicine. It is not an extended knowledge of chemistry that is required—it is only a confidence in the results obtained by chemists that is absolutely necessary. If the farmer becomes acquainted

with the facts as they apply to his practice, and if he has such confidence in these facts that he is willing to act in accordance to them, there is not the least necessity that he should occupy his time and burden his mind with all the abstruse processes of reasoning and experimental proof by which the chemist has been enabled to trace out their connection with the complex phenomena which they serve to illustrate.—*Lecture by Dr. Madden, of Penicuik, Edinburgh.*

Taint or Dry Rot in the Potato.—From the experience I have had in the cultivation of the Potato, I have come to the conclusion that the taint or dry rot owes its origin entirely to an injudicious method of planting the seed; and after mature consideration, I have adopted a system of planting, which I have practised for 20 years with such success, as never once to have had an instance of dry rot among my Potato crops during that time, although they were sometimes growing in direct contiguity to other Potatoes, which, from being planted in a different manner, were labouring under the effects of the disease. It shall now be my endeavour, in as simple and concise a manner as possible, to lay this system before my readers, convinced that they will in practice find it a most effectual remedy for the disease in question. The chief cause of this disease I consider to be the prevalent error in planting the Potato, of placing the seed in a quantity of dung laid in the middle of the drill. Any one who knows anything of the qualities of dung, knows that it is of itself incapable of promoting vegetation, or sustaining vegetable life, until decomposed, and incorporated with a portion of earthy soil, and it is not therefore to be wondered at that disease and failures in the Potato crops are so prevalent. The wonder is, that, while such a system of planting is persevered in, any of these crops should succeed at all under such treatment; and indeed this is only to be accounted for by the small quantity and inferior quality of the dung applied, which is generally found mixed with great quantities of half-rotten straw and other extraneous substances, such as coal-cinders, &c., and were it not that the fresh earth is laid immediately on the top of the dung after the seed is planted, the failure of the crops would be to a much larger extent; of this I have no doubt. The ground too, if in a very impoverished state, may by speedily digesting and drying up the dung prevent to a great extent a total failure of the crop, although the seed were planted thus injudiciously in the midst of the dung; for it will be observed that in such ground the rot is not so destructive as in rich deep soils. The first and great point, therefore, in setting the Potato, is to have the manure properly commingled with the soil before introducing the seed, the plan I adopt in planting, which is briefly as follows:—In preparing a parcel of ground for the reception of the Potato seed, I proceed to have the manure spread regularly over the surface, and evenly dug in. I then either drill the ground, after the manner of gardeners in sowing peas, and plant the Potatoes in the drill, or plant them with a dibble, without drilling, about two or three inches beneath the surface, the dibble being formed with a broad point, so as to insure the Potato having no open space left beneath it, when dropped into the hole. For large fields, which cannot well be dug or planted in this manner, I would recommend the ground to be prepared and the dung spread exactly as for Oats or Barley. Then have the ground drilled, and in planting place the seed Potato in the clean soil, on the back of the half drill, formed by the return of the plough, which half drill should be made larger than ordinary, to bring the seed as near to the centre of the drill as possible, so as to afford it every advantage of the fresh soil to vegetate in. In this way the fructifying earth, in which the seed is embedded, will secure it healthful vegetation, and as it progresses in its growth, and so soon as it throws out roots, it will reap the full benefit of the manure contained in the surrounding soil. It is of the utmost importance to have the seed planted, so as it may have the earth both below and above it when put in; for in keeping the seed free from the dung, I apprehend, lies the whole secret, which should be particularly attended to.—*From a work on this subject, by J. Smith.* Blackie and Sons, Glasgow.

Notices to Correspondents.

RURAL CHEMISTRY. By Edward Solly, Esq., F.R.S., Experimental Chemist to the Horticultural Society of London, Hon. Mem. of the Royal Agricultural Society, and Lecturer on Chemistry at the Royal Institution, has been reprinted from the *Gardeners' Chronicle*, with additions, and may be had of all booksellers, price 4*s*. 6*d*.

ANALYSIS.—*Subscriber.*—Thank you. We may possibly hereafter give directions for detecting adulterations, but our views of the subject of your letter you will gather from an extract of a lecture by Dr. Madden, in our miscellaneous section on the proper connection between the chemist and the farmer.

BANBURY GUARDIAN.—*W. B.*—We always insert quotations in our miscellaneous section, and are careful to acknowledge the source of them. "W. H., Reading," is a known correspondent of ours: his communications reached us in the form of a manuscript letter. If he copied that communication from you, without acknowledgment, he was much to blame.

BOOKS.—*Beginner.*—The author is Mr. Warnes, of Trimingham, Norfolk. Apply to any bookseller.

HORSEPONDS.—*Reader.*—If the pond is not large, and the water very black, fling charcoal dust in, and stir about till the water is nearly muddy, then lift the water all out by buckets or otherwise, and soak heaps of leaves, weeds, earth, &c., with it; you will thus make a good compost.

LIQUID MANURE.—*A Subscriber.*—Measures should be taken either for hindering the formation of volatile salts of ammonia in it, (see Mr. Bree's paper in another page,) or for fixing them as soon as they are formed. Where it is preserved on a large scale, the cheapest plan of applying it is to soak the dungheap with it, and to gather together composts of all kinds of rubbish, weed, and soil of any kind around the tank, for the purpose of being soaked with the urine daily collected in it. The expense and labour of applying the liquid to the land are very great, and it is thus much cheaper to soak heaps of solid materials, and cart it to the land with the compost; but then it must not be allowed to lie there long before being ploughed in. You will find lengthened remarks on this subject in this paper during the course of the next few weeks. Allow us to recommend Mr. Hannam's work on Waste Manures: it refers to the subject of your inquiries. We shall be better able to answer your questions about burnt clay next week.—*A Young Rural.*—Apply it diluted with an equal weight of water, at a little distance from the plants. Soot at the rate of 40 bushels, and guano at the rate of three or four cwts. per acre, are useful manures, and you may advantageously apply them, mixing them well with the soil near the plants, by hoeing or digging. Beetroots will increase in size by stirring the earth round them, not by pulling the leaves.—*X. C.*—If it is not much diluted, 500 gallons will require 200 lbs. of gypsum or 120 lbs. of sulphuric acid to neutralise it, (see Mr. Bree's paper in another page). Gypsum, if in solution, will be decomposed by the carbonate of ammonia. If you can ascertain that there is any of the latter salt in the waste of your kitchen, it will be useful to add gypsum to that waste, as the carbonate, a volatile salt, becomes the sulphate, a fixed salt, of ammonia, by the decomposition which will ensue.

LUCERNE.—*J. Heaton.*—There does not appear anything in your specimen, except its luxuriant growth, to distinguish it from the ordinary variety; but you will be better able to judge of this when it is in flower.—*G. P.*—You cannot do better than grow Lucerne for your purpose. We only know of one variety.

MANURES.—*C. T.*—Bleaching powder is chloride of lime. Willey dust is the refuse separated from wool during the process of cleansing. We do not know what Scutch is.

MILCH COWS.—*G.* is informed that the surest plan to procure Guernsey cows genuine, is in the island itself. The price varies from 12*l*. to 15*l*.—*G. E. D.*—We have not "G.'s" address; and your notice is an advertisement.

POTATOES.—*X. Z.*—There is nothing like good farm-yard manure for Potatoes; there is not that necessity for its being well rotted in the case of the Potato that there is in the case of the Turnip. Apply about 30 cubic yards per acre. The Irish White Apple is one of the best pig Potatoes. The names of other varieties for consumption will be found in a leading article in a late Number of the paper.

STEEPING SEEDS.—*A. Huxtable.*—Rapidity in the vegetation of seeds is often very advantageous; and so far the more rapid the growth of doctored seed, the greater is the value of the steep employed. Thanks for your letter.

TRANSPLANTING SWEDES.—*L. L.*—A seed-bed of 20 or 30 perches should suffice for 7 acres of land. Sow about 2 or 3 lbs. of seed upon it.

TURNIPS.—*Rusticus.*—An acre of good Turnips may be worth 10*l*. or 11*l*. to carry off the land; and the consumption of them on the land may be equal to a manuring of 10 or 12 tons of good dung, equal in value to 3*l*. or 4*l*. per acre.

MISCELLANEOUS.—*T. I. H.*—We have mislaid your address; if you will forward it, you shall hear about your vols. of the *Chronicle*.—*A. B.*—A typographical error occurred last week in our notice of the question you put to "A Farmer and Valuer." What you ask for is the average *gross* produce, not the produce of the *grass* land.

*** As usual, many communications have been received too late.

Markets.

MARK-LANE, MONDAY, May 6.

WE had a moderate supply of Wheat this morning from the home counties, the finest samples of which realised an advance of 1*s*. per qr., and the secondary qualities fully the prices of this day se'nnight.—Free Foreign met an improved inquiry, and a fair extent of business was done in retail sales at our quotations.—Barley maintains its late value, the dry weather inducing holders to ask rather more money, but the sale is lim ted for both English and Foreign.—Beans and Peas are fully 1*s*. per qr. dearer.—There has been a good sale of Oats at an advance of 6*d*. per qr.

FRIDAY, May 10.

The arrivals of English Wheat during the week have been moderate, and the few samples fresh up for this morning's market, sell readily at our Monday's quotations; there was a fair attendance of country buyers, apparently with the intention of purchasing Free Foreign Wheat, but as they offered generally 2*s*. less than the factors were disposed to accept, and that for retail quantities only, but little business was done.—There was some inclination shown to purchase Dantzig f. o. b. and also Polish and Marionopoli afloat.—Barley is very dull, the great bulk of the importation is going direct to the distillers; for that offering on the market (a great proportion of which is in bad condition,) great difficulty is experienced in effecting sales.—Beans and Peas fully support the advance noted on Monday, and Egyptian are selling at 19*s*. f. o. b. including freight and insurance.—The Oat trade is rather heavy, buyers holding off in anticipation of better supplies.

KINGSFORD AND LAY.

WOOL.—BRITISH, FRIDAY, May 10.

WE cannot report any alteration in the English Wool Market since our last. Our advices from the manufacturing districts inform us of a limited amount of sales, but prices have not materially receded, nor do we think it likely they will do so, if the present demand for yarn continues.

	per lb.				per lb.

Southdown Fleeces	1 0½	1 2				

JAMES PEARIN, Wool Broker.

COVENT GARDEN, MAY 11.—The market during the week has been well supplied with most articles. Grapes are more plentiful, and continue to improve in quality. Pine-apples are sufficient for the demand; they are offered at the same prices as last week. Apples and Pears are scarce, particularly the latter. Green Apricots and Gooseberries are more plentifully supplied; the latter are selling at from 5*d*. to 7*d*. per pottle. Oranges are good in quality; but they are becoming scarce, and are a little advanced in price. Strawberries are getting more plentiful. Chesnuts and Lemons are not plentiful. Vegetables are, for the most part, of good quality; but the dry weather begins to affect them; they have, generally speaking, not altered much in price since our last report. A considerable quantity of Potatoes imported from Lisbon are in the market; they are said to be good in quality. Brocoli is somewhat advanced in price. Cabbages are offered at from 10*d*. to 1*s*. 6*d*. per dozen. Cauliflowers are becoming more plentiful; they are also improving in quality. Carrots and Turnips are selling at nearly the same prices as last week. Greens are rather cheaper, as is also Rhubarb. Seakale, French Beans, and Asparagus bring nearly the same prices as are mentioned in our Report for last week. Green Peas have been offered, but only in very small quantities. Lettuces and other salading are sufficient for the demand. Among Cut Flowers we noticed Erica hybrida, E. aristata major, and E. rubra-calyx; Epacris grandiflora, Gardenia radicans, Fabiana imbricata, Verbenas, Fuchsias, Pelargoniums, Calceolarias, Pansies, Auriculas, Cinerarias, Lily of the Valley; Moss, Provence, and China Roses.

FRUITS.

Pine Apple, per lb., 6*s* to 12*s*		Lemons, per 100, 6*s* to 14*s*

Basil, 6*d* to 9*d* per bunch	Cauliflowers, 7*s* to 14*s* per doz.

POTATOES.—SOUTHWARK WATERSIDE, May 6.

THE weather during the past week (Saturday excepted) has been, like several preceding, oppressively hot, which continues to depress our Market, there being many lots of inferior samples from former arrivals unsold, and where it was necessary to clear vessels coming on demurrage further reductions were submitted to, and other lots have been put into the stores in cases in which sales could not be effected. The best samples moved off heavily at former quotations, the dealers only buying for present consumption, and that being considerably lessened by the heat of the weather. Potatoes from Belgium, Holland, and Ireland are selling from 40*s* to 45*s*. The supplies during the past week have been limited, but are fully equal to the demand, and the annexed prices have been barely supported.

York Reds - - -	60*s*	to 90*s*		Essex and Sussex Blues	60*s*	to 65*s*

HAY.—Per Load of 36 Trusses.

SMITHFIELD, May 9.

Prime Upland Hay	65*s* to 74*s*	Clover -	75*s* to 100*s*	Straw -	23*s* to 30*s*
Inferior - -	50 60				

Trade heavy, with lower prices.

JOHN COOPER, Salesman.

CUMBERLAND MARKET, May 9.

Superior Meadow Hay	72*s* to 77*s*	Superior Clover	100*s* to 105*s*	Straw	27*s* to 33*s*
Inferior - -	60 66	Inferior ,,	86 94		

JOSHUA BAKER, Hay Salesman.

WHITECHAPEL, May 10.

Hay - - -	50*s* to 60*s*	Clover -	90*s* to 95*s*	Straw -	26*s* to 32*s*
— fine - -	68 72	— fine	100 105		

HOPS, FRIDAY, May 10.

WE hear from several parts of the Hop plantations that the fly has made its appearance, and our Market this morning is very animated, buyers offering from 2*s* to 3*s* advance, whilst holders are expecting much more; it would therefore be difficult to quote prices.

SMITHFIELD, MONDAY, May 6.—Per stone of 8 lbs.

Best Scots, Herefords, &c.	3*s*	10	to 4*s*	2	Best Downs & Half-breds (shorn) - -	3*s* 8 to 3*s* 10
Best Short Horns -	3	6		3 10	Best Long-wools (shorn)	3 4 3 8
Second quality Beasts -	3	0		3 4	Ewes and second quality	3 0 3 6
Calves - - - -	4	0		4 8	Pigs - - - -	3 0 3 8
Lambs, small - -	6	0		6 4		
— large - -	5	4		6 0		

Beasts, 2540; Sheep and Lambs, 29,770; Calves, 104; Pigs, 402.

We have to-day a still shorter supply of Beef, which has caused a rise of full 2d per 8 lbs. Mutton is in plentiful supply, though not quite so many Sheep as last week, and we notice also there is a falling-off in quality. The best Downs are heavy on hand, which is usually the case on the setting-in of warm weather; our top quotations of all descriptions are barely supported. We have not named Sheep in the wool this week, they being almost out of the market; indeed, as the weather gets warmer they will hardly be saleable. The supply of Lamb is on the increase, the prices rather lower. Veal and Pork remains steady.

FRIDAY, May 10.

In consequence of a very large supply, both of Beasts and Sheep, there was a considerable depression in the trade this day, and the prices lower than on Monday.

Beasts, 758; Sheep and Lambs, 11,440; Calves, 258; Pigs, 48.

41, West Smithfield.

MARK FORREST.

Sales by Auction.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE & MORRIS will submit to public competition, at the Auction Mart, Bartholomew-lane on Tuesday, May 14th, and Thursday, 16th, 1844, at 12 o'clock each day, about three hundred DAHLIAS, comprising all the leading varieties, also a splendid assortment of GERANIUMS in Bloom. The newest Varieties of FUCHSIAS, VERBENAS, HEARTSEASE, &c., and a variety of other Flowering Plants. May be viewed the morning of Sale. Catalogues may be had at the Mart, and of the Auctioneers.—American Nursery, Leytonstone.

SPLENDID COLLECTION OF PLANTS.

MESSRS. ENGLISH AND SON have the honour to announce for SALE the WHOLE COLLECTION of ORCHIDACEOUS and STOVE PLANTS, &c. &c., from the extensive Conservatories of JOHN JARRETT, Esq., of Camerton Court, near Bath, which they will sell by Auction, at their Rooms, Milsom-street, on THURSDAY, MAY 16th, at Twelve o'clock, punctually.

In offering this rare and beautiful Collection the Auctioneers feel that any of the usual superlative expressions in its favour, however well merited, would be unnecessary—the highly-respected proprietor having long been well known as a connoisseur of the most liberal expenditure, and of the highest taste and judgment in his selection and culture, adding, by his extensive contributions, more highly than any to the interest of the Bath, Bristol, and other Horticultural Exhibitions, and the most successful in obtaining the first-class prizes.

This genuine and splendid Collection comprises about 200 ORCHIDACEOUS PLANTS, including many very fine Specimens of CATTLEYA, IN VARIETY; several magnificent ARAUCARIAS EXCELSA, about 500 RARE STOVE PLANTS; and about 100 of the finest ERICAS, &c. &c. The whole will be found to be one of the very choicest assemblages of Floral varieties ever offered to public competition in the neighbourhood of Bath, there being not a production among them but would be an acceptable addition to the garden of any gentleman in the kingdom.

Catalogues are in preparation. Further particulars in next Advertisement.

MR. RAINY respectfully begs leave to acquaint the Nobility, Gentry, and the Public, that in order to meet the times, and in consequence of the pressure of mortgages and other incumbrances upon estates, and the various descriptions of real property, brought into the market for sale by public auction and private contract, it is his intention to adopt for the future a REDUCED and GRADUATED SCALE of COMMISSION, as compared with that which has been generally customary for the last half century. At the same time that the expenses of vendors will thus be materially diminished, he trusts that he shall be able to afford greater facilities to the attainment of their objects, and to the fullest advantage: and, touching these points, he feels it necessary to offer a few words of explanation.

There exists between many solicitors and many auctioneers an understanding, to which the epithet collusive would scarcely be too severe, because by it the interest of their clients, the vendors, is often seriously compromised, and in this manner:—The vendor, instead of himself selecting the auctioneer or agent for the disposal of his property, will, in many cases, confide the choice to his solicitor; and not unfrequently the solicitor (but upon what justifiable plea Mr. Rainy never could comprehend) arrogates to himself the right of such choice; and repeated instances might be adduced to show that that choice has been exercised in contravention, if not in opposition, to the previously-expressed wishes of the vendors, and wholly regardless of old and long-established connexions; these solicitors having usually a secret compact with the auctioneer, by which he is bound to fee the solicitor with a share of his commission and other charges, as the *sine quâ non* of his being appointed to the sale. And what is the consequence? In such quarters the auctioneer who is willing to concede to the solicitor the largest share, or, in other words, consents to pay the heaviest bribe, he, be he quack or otherwise, and with slight reference to his regular initiation into his profession, or his qualifications or experience, or (what also is evidently an essential consideration) the extent of his connexions and influence, he is preferred. Thus tempted, many solicitors have become reconciled to abuse the patronage they have assumed, and aim at excluding those auctioneers who, like Mr. Rainy, have consistently and uniformly refused to submit to a tyranny subversive of all proper rivalry, and at variance with all independent and honourable feeling.

With respect, however, to what may be considered the legitimate association of the province of the solicitor with that of the auctioneer or public agent, Mr. Rainy, with the desire to obviate jealousies, to produce a more cordial and satisfactory co-operation between those parties, and in the hope of entirely abolishing secret and derogatory compacts, would suggest that, as a remuneration to the solicitor of the vendor, for his advice and assistance in the drawing and settling of the conditions of sale, and for his attention to those legal points which are in immediate relation with that part of the transaction, a fair portion of the commission should accrue to the solicitor (but with the full knowledge and sanction of the vendor), in lieu of the charges now made by him for the particular items adverted to. This, however, is not intended to include charges for investigations of title, abstracts, deeds, or papers, or fees to counsel; and Mr. Rainy entertains no doubt that the nobility, gentry, and the public will approve of and support the principle of repudiating altogether any clandestine dealings between parties employed in affairs so important to them. But, in all cases where the vendors do not consent to the appropriation to the solicitor of such portion of the commission; or the solicitor, from that integrity, impartiality, and strict sense of justice, and that delicacy and liberal feeling which fortunately characterise the conduct of a large number of the members of the legal profession, declines the acceptance of it; then such portion will be remitted by Mr. Rainy to the vendor by whom he is employed.

With regard to sales of pictures, or other works of art, jewels, plate, libraries, and other valuables, a considerable reduction will also be made in the commission, as compared with the printed terms of Messrs. Christie and Manson, Mr. George Robins, and most other auctioneers. On this branch, however, no payment is contemplated to any of that numerous class of individuals who perpetually attempt to interfere, as middle-men, and ask to be rewarded for doing nothing; such voluntary interference being wholly useless and absurd, and indeed very often mischievous to the interests of those whom they pretend to serve. The allowance, therefore, which many auctioneers give, and these persons in secret phrase, upon what is termed "the reciprocity system" (meaning, in plain language, on the part of the auctioneer, "procure the sale for me and I will hand over to you a share of the profit"), will be saved by the reduction in Mr. Rainy's new scale of commission on real and personal property, solely and exclusively in favour of the vendor; and where the total gross proceeds may exceed £—, a still further abatement will apply to the residue.

A similar rule will also govern Mr. Rainy's charges for putting up property to auction, if not sold; for purchases, valuations (including those for probate), references in cases of compensation, or [illegible] upon cases; obtaining loans upon mortgage (in conjunction with solicitors), and all other matters incidental to property.

In conclusion, he begs to add that, as heretofore, no sale will be undertaken by him, the genuine character of which will not bear publication, and every exertion will be made to counteract and defeat combinations and deceptions, whether they are directed against vendors or purchasers.

No. 14, Regent-street, St. James's (in the division between Jermyn and Charles streets.)—April, 1844.

WATERLOO-PLACE, PALL-MALL, commanding the view to St. James's Park.—The spacious capital MANSION recently occupied by the CLARENCE CLUB.—By Mr. RAINY, on the premises, on THURSDAY, May 30, at One precisely, unless previously disposed of, and with the option of taking the excellent Household Furniture at a fair valuation,

THE capital, spacious, and elegantly-fitted MANSION, No. 12, on the west side of Waterloo-place, held under the Crown for an unexpired term of 70 years at a small ground-rent. Within the last few years some thousand pounds have been expended in improvements to the premises under the superintendence of an eminent architect, and they are at present in perfect condition, peculiarly adapted for a club, insurance office, or any public establishment requiring a first-rate situation. The ground-floor contains a hall, with handsome principal stone staircase and secondary staircase; one room 42 feet 8 inches by 22 feet 9 inches, and another 27 feet by 24 feet. On the one pair, a drawing-room 31 feet 6 inches by 22 feet 6 inches, and a library 42 feet 8 inches by nearly 16 feet, and an ante-library; a billiard room, three other rooms, and four dressing-rooms on the two pair, and six bed-chambers on the upper floor; complete domestic offices on the basement, including spacious kitchen, larders, &c.

To be viewed till the sale by tickets, which may be had of Mr. RAINY, No. 14, Regent-street; printed particulars may be had of him 14 days preceding the sale; also of Messrs. LANE and PRIDEAUX, Goldsmiths' Hall; at the Auction Mart; and on the premises.

On the same and following days will be sold by auction the plate, linen, books, china and glass, and the valuable cellar of choice wines, further particulars of which will be given in a few days.

BUCKINGHAMSHIRE.—THE GRANGE, a desirable Freehold Residence, with Pleasure grounds and Gardens, and about 30 Acres of Land, situate at Chalfont, St. Peter's, the Property of the late General O'Loghlin.—By Mr. RAINY, at the Gallery, No. 14, on the East Side of Regent-street, St. James's; about the end of May, with immediate Possession,

THE GRANGE, an elegant Freehold Residence, situate in a beautiful part of the county of Buckingham, midway between London and Aylesbury, about 7 or 8 miles from the West Drayton and Slough stations on the Great Western Railway, and within 9 miles of Windsor and 5 of Uxbridge. It is seated on the acclivity of a hill in a park-like paddock, ornamented with fine old timber and plantations, approached by carriage drives with neat lodges, contains hall and conservatory, drawing-room 32 feet, billiard-room, library, dining-room, 15 bed rooms, three dressing-rooms, excellent offices and stabling, walled kitchen-garden, farm-yard and buildings, ice-house, gardeners' house, &c.

To be viewed till the sale, and printed particulars may be had 14 days preceding; also of Messrs. DENDY and MORPHETT, Breams-buildings, Chancery-lane; at the Royal Hotel, Slough; the Inns at Aylesbury and Uxbridge; at the Auction Mart; and of Mr. RAINY, 14, Regent-street.

BROMPTON-SQUARE.—Neat LEASEHOLD HOUSE, held for 76 years, at a small Ground-rent—By Mr. RAINY, at the Gallery, No. 14, Regent-street, about the end of May, with immediate possession.

THE neat and substantial LEASEHOLD HOUSE, No. 3, on the west side of Brompton-square, held for 76 years, at a small ground-rent; comprising two rooms on each floor, two kitchens, and other Offices, and a garden.

To be viewed, and printed particulars had, 14 days preceding, on the premises; of Messrs. METHOLD and PYKE, No. 43, Lincoln's-inn-fields; at the Auction Mart; and of Mr. RAINY, No. 14, Regent-street.

PUTNEY-HILL, SURREY.—LIME-GROVE, a spacious Freehold Mansion, let on Lease for a few years unexpired, and the contiguous beautiful Lands, highly eligible for building upon, and containing altogether about 68 Acres.—By Mr. RAINY, at the Gallery, No. 14, on the East Side of Regent-street, St. James's, in the Division between Jermyn and Charles-streets, about the end of May,

THE spacious and capital detached FREEHOLD MANSION, LIME-GROVE, delightfully situated on the rise of Putney-hill, only four miles and a half from the metropolis. It is approached by carriage drives, and contains suites of noble lofty principal apartments, with numerous bed-chambers, offices of every description, coach-houses, stabling, beautiful lawn ornamented with full-grown timber, pleasure-grounds with extensive walks, walled gardens, &c., the whole about 11 acres, on lease for a few years unexpired at 350*l.* per annum; also the contiguous lands extending from the Putney-hill-road into the road leading from Putney to Wandsworth, and other lands called the Nursery, on the west side of the Putney-hill-road, and fronting the road leading from Putney to Richmond; a timber dwelling-house, formerly in the occupation of Mr. Howey, some cottages, &c., altogether about 56 acres and highly eligible for building upon, especially the upper ground, from which the finest views are commanded.

The Mansion can only be viewed by special permission of the tenant, and by cards to be had of Mr. RAINY, 14, Regent-street. Printed particulars with lithographed plans will be ready for delivery 14 days preceding the sale, and may then be had of him; also of Messrs. POWELL, F. and W. BRODERIP, and WILDE, Lincoln's-inn; at the Auction Mart; at the Castle, Richmond; Spread Eagle Wandsworth; and of the person who will attend daily 14 days preceding the sale to show the lands.

ST. JAMES'S SQUARE.—To be sold by PRIVATE CONTRACT, by Mr. RAINY (with immediate possession), the capital FREEHOLD MANSION of a nobleman. The premises are of modern construction, with spacious lofty principal apartments, hall, and two stone staircases, with offices for a suitable establishment and capital stabling. A smaller Freehold House, which fronts Duke-street, and was formerly part of the original estate, may also be purchased if desired.—For particulars and tickets to view apply to Mr. RAINY, 14, Regent-street, St. James's.

HYDE PARK GARDENS, commanding the entire View over Hyde Park.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY (with immediate possession), one of the best MANSIONS in this much-admired and highly-improving situation. It was finished and completed by the present owner and furnished throughout without regard to expense; and it may safely be affirmed that it is scarcely possible to find a residence of the scale more perfect, both as regards the decorations and the general style and quality of the furniture. The tenure is leasehold for about 90 years at a ground-rent.—To be viewed by a day's previous notice, and by tickets, which with particulars may be had of Mr. RAINY, 14, Regent-street, St. James's.

HAMPSHIRE.—VALUABLE CHURCH PREFERMENT, about 12 Miles from Winchester, and 17 from Southampton; the Incumbent is in his 73d year.—By Mr. RAINY, at the Gallery, No. 14, on the East Side of Regent-street, St. James's, in the Division between Jermyn and Charles-streets, about the end of May,

THE PERPETUAL ADVOWSON of the PARISH of WARNFORD, in the county of Hants, with the appurtenances thereto belonging. The tithes have been commuted at 620*l.* per annum. There is an elegant modern residence, situate on an eminence commanding beautiful scenery, with 20 acres of glebe pleasure grounds, walled garden, stabling, &c. Warnford is about 17 miles from Southampton, 12 from Winchester, and 60 from London, and the neighbourhood is of the highest respectability.

Printed particulars may be had, 14 days preceding the sale, of Messrs. STONE and TURNER, Jermyn-street; at the Auction Mart; at the Dolphin, Southampton; George, Winchester; and of Mr. RAINY, 14, Regent-street.

BELGRAVE-SQUARE.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY (with immediate possession), the noble and spacious MANSION the residence for some years of the late Lord Hill. It stands detached, with carriage-drive, and has a large garden at the back, with communication to stabling for eight horses, a loose box, standing for several carriages, with lofts and rooms over. Leasehold under the Marquis of Westminster for an unexpired term of 80 years, at a ground-rent.—Particulars and tickets to view may be had of Mr. RAINY, 14, Regent-street, St. James's.

IN a FASHIONABLE SQUARE at the WEST END.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, a MANSION of the first class, equal in all its arrangements to the accommodation of a family of the highest distinction; the offices and stabling extensive and complete. The adapted furniture will be included in the purchase.—Principals only can, in the first instance, receive information, and which may be had on application to Mr. RAINY, 14, Regent-street, St. James's.

PORTMAN-SQUARE.—To be LET, FURNISHED, for the Season, a compact, moderate-sized HOUSE, with coach-house and stabling.—Particulars and tickets to view may be had of Mr. RAINY, 14, Regent-street, St. James's.

Gloucester-place, Portman-square.

MR. RAINY respectfully begs leave to acquaint the Public that the LEASEHOLD RESIDENCE, No. 107, Gloucester-place, Advertised for Sale by Auction, is DISPOSED OF BY PRIVATE CONTRACT.—No. 14, Regent-street, May 9, 1844.

OPPOSITE the GREEN-PARK.—To be LET, elegantly and completely FURNISHED, for the season, or for one or more years, a superior and spacious MANSION, in perfect condition, having suites of apartments, bed-chambers, and offices, for a family of rank; and at a short distance is excellent stabling.—For particulars and tickets to view apply to Mr. RAINY, 14, Regent-street.

HAMPSHIRE, between Fareham and Gosport, and within a mile and a half of the Railway Station.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, with immediate Possession, a very delightful modern FREEHOLD VILLA, with park-like grounds, garden, pleasure-ground, lodges, &c., and the surrounding lands of about 100 acres, part extending to a river, and offering every inducement to any gentleman partial to yachting.—Particulars may be had of Mr. RAINY, 14, Regent-street, St. James's.

HAYES COMMON, two miles from Bromley, in the county of Kent, and twelve from London.—To be LET on LEASE, the very desirable RESIDENCE, for many years the favourite retreat of the late Sir Vicary and Lady Gibbs. It stands on a beautiful lawn, with pleasure-grounds, gardens, and paddocks (about 15 acres), and contains accommodation for a family of high respectability, with stabling, entrance lodge, &c.—For particulars and tickets to view apply to Mr. RAINY, 14, Regent-street, St. James's.

MIDDLESEX, ten miles from Town.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, a capital FARM, part freehold and part copyhold, containing about 217 acres of rich land, with an excellent house and buildings, on lease to a most respectable tenant, till Michaelmas, 1847.—Particulars may be had of Mr. RAINY, 14, Regent-st., St. James's.

BUCKINGHAMSHIRE.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, with immediate Possession, a FREEHOLD ESTATE of about 90 acres of Grass and Arable Land, with agricultural buildings, and an unfinished House, situate at Farnham Royal, two miles and a half from the Slough Station of the Great Western Railway.—Particulars may be had of Mr. RAINY, 14, Regent-st., St. James's.

BATTERSEA, Surrey.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, with immediate Possession, a capital spacious FREEHOLD RESIDENCE, on the banks of the Thames, with terrace-walk, pleasure-grounds, kitchen-garden, paddock, coach-houses, stabling, &c. Also, some other Freehold Property for investment.—Particulars may be had of Mr. RAINY, 14, Regent-st., St. James's.

TOTTERIDGE, MIDDLESEX, Ten Miles from London.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, a very desirable and substantial detached LEASEHOLD FAMILY RESIDENCE, held for an unexpired term of upwards of thirty years, at a very low rent, with offices, coach-houses, and stabling, pleasure-grounds and walks, kitchen and flower-gardens, with fish-pond and park-like meadows, altogether about thirty acres, with three detached cottages, gardener's cottage, and other buildings. The premises are in perfect order, a very considerable sum having been expended upon them, and they are in every respect suited to a family. Or the house and gardens would be let on lease.—For particulars and tickets to view, apply to Mr. RAINY, 14, Regent-street, St. James's.

DURHAM, within one day's ride of London by the Railroads.—To be LET, for three or five years, a spacious FAMILY RESIDENCE, FURNISHED in a superior style, and adapted for a person of fortune, situate in a beautiful part of the country, with good fishing and hunting, and the exclusive right of shooting over about two thousand four hundred acres. The neighbourhood of the best class, and the circumstances altogether peculiarly desirable. Land may be had or not, at the option of the tenant.—Particulars to be had of Mr. RAINY, 14, Regent-street, St. James's.

NEAR CHRISTCHURCH, HANTS.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, a MARINE VILLA, situate midway between Lymington and Christchurch, commanding splendid sea views; and also an adjoining farm of about 108 acres, with farm-house and buildings, the whole freehold.—To be viewed by tickets, and particulars had of Mr. RAINY, 14, Regent Street, St. James's.

GROSVENOR-PLACE, HYDE PARK, in front of the Gardens of Buckingham Palace.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, a noble and very spacious MANSION, held for a long term, at a low ground-rent, and adapted in all respects to a family of distinction, with attached and detached offices, standing for four or five carriages, and stabling for eight horses. The Mansion has an extra story of bed-chambers, a suite of superb drawing rooms—viz., 27 feet by 20, 22 feet by 19, 25 feet by 19, and 37 feet by 25, all communicating by folding doors; an eating-room, 37 feet by 25, library, ante-room, two stone staircases, stone hall, screened by a porch, &c.; the whole of the household furniture and fixtures will be included in the purchase, and immediate possession may be had.—To be viewed by tickets, which, with particulars, may be had of Mr. RAINY, 14, Regent-street, St. James's.

ENFIELD, MIDDLESEX.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, CHASE LODGE, a substantial and handsome Freehold Villa, with pleasure-grounds, gardens, and paddocks (the latter part leasehold), about 27 acres.—Particulars may be had of Mr. RAINY, 14, Regent-street, St. James's.

Sales by Auction.

EAST COWES CASTLE, in the ISLE of WIGHT, to be SOLD by PRIVATE CONTRACT, by Mr. RAINY.—This distinguished FREEHOLD MARINE MANSION, of stone, and in the castellated style of the time of Edward the Sixth, was erected, at unlimited expense, by the late John Nash, Esq. It affords the most ample and elegant accommodation for a family of distinction, and is especially suited to any member of the Royal Yacht Club. The scenery is too well known and appreciated to render eulogium necessary, and it will be admitted that the facility of access from the metropolis (the distance being now accomplished in about four hours, gives to the property a much increased value. The chief apartments are lofty, and expensively finished; they include a dining room, 30 feet by 20; a drawing-room, 28 feet 6 in. by 21 feet 6 in.; and a library, 30 feet by 27; a billiard room, 30 feet 6 in. by 18 feet 6 in.; and an octagon library, 19 feet by 19; numerous principal and secondary bed-chambers and servants' apartments, offices of every description, splendid conservatories, a picture or statue gallery, 70 feet by 21; gardens of a superior order, with hot-houses, &c. The grounds, which are beautifully undulated, contain, with the gardens, paddocks, &c., about 43 acres, embellished with noble timber and plantations of luxuriant growth, and walks of considerable extent are cut through them.—Particulars and tickets to view may be had of Mr. RAINY, 14, Regent-street, St. James's.

CLOSE to SOUTHAMPTON.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, either together or separate, and with immediate Possession, TWO capital detached RESIDENCES, with such portion of park-like land as may be agreed upon, and either with or without a superior Farm, with excellent farm-house and buildings. The whole estate is Freehold, and comprises 175 acres; and from its immediate contiguity to the improving town of Southampton, presents a most favourable opportunity for a successful building speculation.—Particulars may be had of Mr. RAINY, 14, Regent-st., St. James's.

HANTS.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, a capital and spacious FREEHOLD MANSION, standing in a beautiful park of 150 acres, with pleasure-grounds and wilderness, carriage-drives, with lodges, capital walled-garden, hothouses, farm-buildings, &c. &c. The mansion is adapted to the accommodation of a family of distinction, is situated in the midst of the rich and admired scenery of the New Forest, its celebrated field-sports and extensive drives, only nine miles from Southampton, and accessible from the Metropolis in about four hours.—To be viewed with tickets, which, with particulars, may be had of Mr. RAINY, 14, Regent-st., St. James's.

NORTH WALES.—To be SOLD, by PRIVATE CONTRACT, by Mr. RAINY, a highly improvable FREEHOLD ESTATE, land-tax redeemed, situate in a fine part of the country, and commencing within a mile of a capital market town. It comprises 2260 acres, with excellent farm-houses and buildings, all well tenanted; a moderate residence and offices (requiring repairs), a fine lake stored with fish, very thriving woods and plantations, &c., forming a fine and very eligible property for investment.—Particulars may be had of Mr. RAINY, 14, Regent-street, St. James's.

RUTLAND GATE, HYDE PARK.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, a very desirable new-built and elegantly finished RESIDENCE, together with the nearly new household furniture. It commands an uninterrupted view over Hyde Park, has an extra story of bed-chambers, a coach-house, and stabling; held for a term of about 90 years, at a small ground-rent.—To be viewed by tickets, and particulars had of Mr. RAINY, 14, Regent Street, St. James's.

RICHMOND, SURREY, commanding Views of the River Thames and the adjacent Scenery.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, the very beautiful Gothic MANSION, on the rise of the Hill, for many years the residence of the late Mrs. Ellerker, but disposed of on behalf of her representatives, a few months since, to the present owner, who has altered and improved the premises, and made additions at a large outlay. It is arranged to afford complete accommodation for a family of the highest respectability. The dining-room is 30 by 20 and 14 feet high, a library, two drawing-rooms with folding-doors, numerous bed-chambers, offices of every description, ice house, coach-houses, stabling, and cottage, pleasure-grounds beautifully laid out and ornamented with handsome timber and walks, &c. Or the House would be Let furnished by the year or for six months.—To be viewed by tickets, which may be had of Mr. RAINY, 14, Regent-street, St. James's.

NEAR SOUTHAMPTON.—To be SOLD, by PRIVATE CONTRACT, by Mr. RAINY, with immediate possession, a singularly beautiful MARINE MANSION, upon which the present owner has expended many thousand pounds. It is delightfully situate about four miles and a half from the Southampton, Botley, and Fareham stations, and stands in a park-like paddock of 35 acres, well timbered, with superior gardens and grounds, stabling, lodge, &c., and commands very fine sea and inland views.—Particulars may be had of Mr RAINY, 14, Regent-street, St. James's.

KENT.—Six miles from Canterbury, and near to the Sea.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, a valuable FREEHOLD ESTATE, partly exonerated from land-tax; comprising a park of beautifully undulated surface, a moderate sized family residence, and offices, and also three farms; the whole about 640 acres, and may be treated for together or separately.—Particulars may be had of Mr. RAINY, 14, Regent-street, St. James's.

KENT.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, the very valuable and beautiful Freehold Estate, COMBEBANK, the seat of the late Viscount Templemore, situate in the rich vale between Madam's Court Hill and Sevenoaks, 23 miles from London, and a few miles from a railroad station; comprising the finely-timbered park and woods, sheet of water, the noble mansion, stabling, gardens, pleasure-grounds, and walks, the capital farm, with complete agricultural buildings, lodges, &c. The whole about 520 acres, land-tax redeemed. Many thousand pounds have been expended in improvements upon the mansion and property during the last few years, and the whole is in the most perfect condition. Little Combe Bank, a villa, with grounds and some houses in the village, form part of the estate, and will be included in the purchase. Part of the purchase-money may remain on mortgage.—Particulars and tickets to view may be had of Mr. RAINY, 14, Regent-street, St. James's.

STRETTON-STREET, PICCADILLY, overlooking the Gardens of Devonshire House.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, or Let on Lease, a spacious modern RESIDENCE, with hall and two staircases, capital eating-room, library, and other apartments, on the ground-floor; elegant drawing-rooms and a best bed-chamber and dressing-room, on the one pair; numerous other bed-chambers and servants' apartments, and ample offices on the basement. Coach-house and stabling may be rented at a short distance.—To be viewed by tickets, and particulars had of Mr. RAINY, 14, Regent-street, St. James's.

SUFFOLK, on the Borders of Norfolk, and about 80 miles from London.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, a very important and valuable FREEHOLD ESTATE, especially attractive for a sportsman, having been strictly preserved, and affording shooting equal to any domain in the district. It comprehends the entire parish, of nearly 5500 acres, including thriving plantations; also, a capital family mansion, with offices of every description, gardens, pleasure-grounds, &c.; farm-houses and buildings, cottages, &c. The estate is situated in one of the best neighbourhoods in the kingdom, and it is expected that a railroad station will be fixed within a few miles.—Particulars may be had of Mr. RAINY, 14, Regent-street, St. James's.

NEAR WELWYN, Herts.—To be DISPOSED OF, the unexpired LEASE of about four years, at a modeate rent, (with a renewal if desired), of the capital and very desirable Residence, DIGSWELL HOUSE, delightfully situate about a mile and a half from Welwyn, in the vicinity of many mansions of persons of rank, and only four miles from Hatfield, seven from Hertford, and twenty-five from London, and in the neighbourhood of Mr. Brand's fox-hounds. The house is adapted to accommodate a large family, the gardens and pleasure-grounds well laid out, and surrounded by about fifty acres of productive land, the whole about seventy acres, ornamented with fine timber, and in excellent order: or the premises would be let furnished.—To be viewed by tickets, which, with particulars, may be had of Mr. RAINY, 14, Regent-street, St. James's.

ACTON, MIDDLESEX, Five Miles from Hyde Park.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, a singularly elegant FREEHOLD RESIDENCE of the best class, approached by a corridor and hall, and containing library opening to a conservatory, drawing-room, dining-room, &c., seven best bed-rooms, ample servants' rooms and offices for a family, coach-houses and stabling, capital kitchen-garden, walled pleasure-ground, and paddock, about 10 acres. The household furniture may be taken at a fair valuation.—To be viewed by tickets, which, with particulars, may be had of Mr. RAINY, 14, Regent-street, St. James's.

HYDE PARK, commanding the entire Park view.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, or Let Furnished for a term, a very elegant FREEHOLD RESIDENCE, in perfect order, suited to a moderate-sized family. The residence has an extra story of bed-chambers, good offices, and stabling.—To be viewed by tickets, and particulars had of Mr. RAINY, 14, Regent Street, St. James's.

NEAR RUISLIP, Middlesex, on the borders of Hertfordshire, and about fourteen miles from London.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, with immediate Possession, the delightful RESIDENCE of the late General Sir Joseph Fuller, G.C.B., with offices, stabling, gardens, pleasure grounds, and park-like paddocks; altogether about sixty acres, with ornamental water and fine grown timber. The elegant furniture may be had or not, at the option of the purchaser.—Particulars and tickets to view may be had of Mr. RAINY, 14, Regent-street, St. James's.

BROWNSEA CASTLE and ISLAND, near Poole, Dorsetshire.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, with immediate Possession, the much admired and beautiful FREEHOLD ESTATE, the Island of Brownsea, about a mile and a half in length, and three-quarters of a mile in breadth, at the entrance of the harbour of Poole, a few hours' sail from the Isle of Wight, and within a few miles of the new and much frequented bathing-place, Bournemouth. The castle is spacious and furnished, has excellent gardens, hot-house, conservatory, &c. The island affords wild fowl shooting in the greatest profusion. The situation is peculiarly desirable for yachting, and the scenery is of a picturesque character. The castle would be let furnished, for three years.—Particulars and tickets to view may be had of Mr. RAINY, 14, Regent-street, St. James's.

TULIPS.

TO BE SOLD BY AUCTION, on THURSDAY, 16th May, 1844, at 11 o'clock precisely, by Messrs. HUNTER and SON, a rare and splendid BED OF TULIPS (including several Seedlings of first-rate quality), allowed to be one of the first in England, and well worthy the attention of Amateurs and Growers; the property of the Rev. C. DEWHURST RISBY, Gate-street, Bury St. Edmund's, Suffolk, who is leaving the county.—Descriptive Catalogues may be had of the Auctioneers, Abbey, Gate-street, Bury St. Edmund's.

AT COLCHESTER, ESSEX.

SPLENDID BED of TULIPS, CROCUSES, HYACINTHS, &c., to be Sold by Auction, by J. S. SURRIDGE, on WEDNESDAY, MAY 15, 1844, at 12 o'clock, without any reservation, in consequence of the decease of the Proprietor, the late Mr. PEPPER, consisting of 500 very valuable named Flowers, which have been selected with great care and attention during the last 30 years; also about 400 Offsets and other Plants, Awnings, &c., as will be expressed in Catalogues, to be had at Mr. Fenton's Printing-office, Colchester; of the Auctioneer, Coggeshall; and at the Green Dragon, Bishopsgate-st., London.

TO GENTLEMEN, FLORISTS, AND OTHERS.

TO BE DISPOSED OF, a choice COLLECTION of upwards of 900 fine named TULIPS, the property of Mr. J. P. HEERREMANS, Lucknam-grove, near Bath. Mr. J. MILLER (late of the Durdham Down Nursery, Bristol) will submit to public competition, on Wednesday, the 15th of May next, a fine collection of Tulips, consisting of all the choicest varieties, and now in fine Bloom, catalogues of which may be had on the day of sale on the premises. Should the day be wet, the Sale will take place on the following day, the 16th. Lucknam is situated 3 miles from the Box Station of the Great Western Railway, and 7 miles from Bath. They may be viewed any day previous to the Sale. Sale to commence precisely at 12 o'clock.

Albert Villa, Westbury, near Bristol, May 9, 1844.

TO GENTLEMEN, FLORISTS, AND OTHERS.

TO BE SOLD BY AUCTION ON THURSDAY, 16th MAY, on the Premises, LAMB FARM, KINGSLAND, a Choice Collection of TULIPS, comprising many of the Leading Varieties, also DAHLIAS, FUCHSIAS, PETUNIAS, &c. &c., —the property of William Alexander—without reserve, the ground being required for building. May be viewed three days prior to Sale. Catalogues can be had as above, or of Mr. PILE, Cambridge Road, Mile End.

TO BE SOLD.—A Six-light Greenhouse of Miscellaneous PLANTS; also about 500 Pots of Plants for bedding out.—Inquire of Mr. BURROWS, Gunnersbury-lane, Acton.

ADVANTAGES.

A BONUS of two-thirds of the Profits allotted to the Assured.

LOWER RATES OF PREMIUM charged for Assurances without profits.

PREMIUMS payable Annually, Half-yearly, or Quarterly.

ASSURANCES OF EVERY DESCRIPTION may be effected. Among others, the important one, *originated by this Society*, of securing a sum to the Assured himself on his attaining any given age, or to his family *in the event of his earlier death.*

A POCKET DIARY containing detailed particulars, may be had on application at the Office, or of the Society's agents.

JENKIN JONES, Actuary and Secretary.

PROVIDENT LIFE OFFICE, 50 REGENT STREET, FEB. 15, 1844.

BONUSES DECLARED, 529,306l. 17s. 7d.

NOTICE is hereby given, that all Persons who hold Policies in this Office, bearing date prior to the year 1834, may receive the present value of the Bonuses which have been added to their Policies, upon application at the Head Office, or to the Agents through whom the Policies were issued.

GEORGE BEAUMONT, Actuary.

CORPORATION of the LONDON ASSURANCE:

Established A.D. 1720.

LIFE ASSURANCE.—Great advantages are offered to the public by this office:—

An annual abatement of premium after five years' payment.

A lower fixed rate without abatement.

Fire Insurance effected upon every description of property, including rent.

Assurances are also effected on ships and merchandise at sea, and going to sea. JOHN LAURENCE, Sec.

Offices—10, Birchin-lane, and 10, Regent-street. Attendance daily from Ten till Four.

VICTORIA LIFE ASSURANCE COMPANY.—

Trustees.

Sir Jas. Duke, Ald., M.P., Chairman.

Benjamin Hawes, Esq., Deputy Chairman.

Benjamin Barnard, Esq. | Charles Baldwin, Esq.

Peculiar advantages are offered by this Company. Thus—

Parties assuring the lives of others may make their policies secure, notwithstanding the life assured may go out of the limits of Europe, without the necessary permission of the Directors having been previously obtained.

Credit of half the premiums for the first five years allowed on policies effected for the whole term of life.

On policies of five years' standing, half the amount paid, after the first year's premium, may be borrowed thereon by the Assured.

Advances made to assurers on real or undoubted personal security, for terms of years, re-payable by instalments.

Attention is particularly requested to the detailed prospectuses of the Company, which may be obtained at the Office, 18, King William-street, City, or by letter, addressed to the Secretary.

WILLIAM RATRAY, Actuary and Secretary.

NEW PROSPECTUS.

ALBION LIFE INSURANCE COMPANY, Instituted in 1805, New Bridge-street, Blackfriars. Bonus every Three Years. Eighty per cent., or four-fifths of the profits returned on policies effected on and after this day.

The New Prospectus, containing a full detail of the highly advantageous terms on which Life Insurances are now granted by this Company, may be obtained at the Company's Office.

1st May, 1844. EDWIN CHARLTON, Sec.

News of the Week.

THE recall of the Governor-General of India has of course excited some speculation on the choice of his successor, and rumour was busy last week in anticipating the probable decision of the East India Directors. All doubt is now removed by the announcement that Sir Henry Hardinge, the Secretary-at-War, has been selected with the joint concurrence of the Cabinet and the Directors, and that arrangements are in progress for his departure by the next Overland Mail. In the mean time, the Government still persist in refusing to produce the correspondence respecting Lord Ellenborough's recall, and no fresh light will probably be thrown upon the subject until his Lordship arrives in England. It is, however, presumed that as the Directors have chosen a member of the Cabinet which has declared in both Houses of Parliament its entire approval of Lord Ellenborough's policy, the motives which induced them to recall him are not so much connected with State considerations arising out of his political Government of India, as from a general disregard which his Lordship is said to have shown for the views and opinions of the Court of Directors and of their Council in India.—On Monday, Sir Robert Peel brought forward in the House of Commons the anxiously expected intentions of the Government with respect to the Bank of England and banking generally, in England and Wales. The leading features of his proposed measure are, that the Bank of England is to retain its present privileges, but to be divided into two distinct departments, the one of Issue, the other of Banking; the latter to be free and uncontrolled, but the Issue department to be based on public securities to the amount of 14,000,000l., beyond which the Bank is not to increase its circulation, unless it has the consent of three Members of the Government,—all profit in that increased issue to be transferred to the State. In addition to this, the Bank is to publish weekly accounts of the notes in circulation, the quantity of bullion, and the extent of fluctuation. In regard to other banks, the business of banking, as in the Bank of England, is to be free and open to competition; the business of issue to be controlled. No new Banks of Issue are to be constituted; but those now existing are to retain their privileges, subject to a restriction of their circulation to a fixed amount, and to the periodical publication, not only of their liabilities, but also of the names of all their partners, so that the public may know who are responsible. No new Joint-Stock Bank can be constituted without the sanction of Government, and provision is made for registration, for a regular audit of accounts, and other matters. For the further details of this important measure, we must refer our readers to our Parliamentary Report.—The Irish State Trials are again postponed, the Chief Justice on Tuesday having announced that the Court, after hearing the arguments on both sides on the motion for a new trial, were unable to give a decision until next Term.

Home News.

COURT.—The Queen, accompanied by the Princess Royal, left Buckingham Palace on Saturday for Claremont. Prince Albert remained in town to attend the dinner of the Royal Academy, and joined her Majesty at Claremont in the evening. The Prince of Wales and the Princess Alice also arrived at Claremont on the same day. On Monday Prince Albert came to town to attend the rehearsal of the Concert of Ancient Music, and returned to Claremont in the afternoon. The Queen and Prince arrived at Buckingham Palace on Wednesday from Claremont, and attended in the evening the Ancient Concerts, of which His Royal Highness was the Director. It is announced that her Majesty and Prince Albert will honour the Montem at Eton with their presence on Whit Tuesday, the 28th inst., and it is expected the Court will remain at the Castle during the whole of that week. Under these circumstances it is expected that, as this will probably be the last visit of the Sovereign to the Castle for some months, the necessary preparations will be sufficiently forwarded, so as to enable the Prince to lay the first stone of the new buildings at Eton College, previously to the departure of the Court for town. It is also said the intention of the Queen to pay a brief visit to the Isle of Wight during this month has been abandoned, and that her Majesty and the Royal Family will not proceed to the island before the month of August next. It is rumoured that Osborne House has been found so small and inadequate for the accommodation of the Royal suite that the idea of making it a permanent residence for the Queen is all but abandoned, and that negotiations are in progress for the purchase of Norris Castle, at East Cowes, which is much more suitable for a Royal residence. The Countess of

Mount Edgcumbe has succeeded the Marchioness of Douro as the Lady in Waiting; Viscount Hawarden has succeeded the Earl of Hardwicke as the Lord in Waiting; and Sir F. Stovin has succeeded Capt. Meynell as the Groom in Waiting on her Majesty.

The Queen Dowager.—The bulletins of the state of her Majesty have been discontinued, owing to the improvement that has taken place in her Majesty's health.

The Duchess of Gloucester continues slowly but gradually to recover from the effects of her recent accident.

Parliamentary Movements.—A vacancy has occurred in the representation of Abingdon, by Mr. Duffield's acceptance of the Chiltern Hundreds, and Mr. Thesiger, the Solicitor-general, is the only candidate. A vacancy has occurred in North Lancashire by the death of the Hon. Mr. Wilbraham, and Mr. William Entwisle is announced as the Conservative candidate.

Governor-General of India.—Sir Henry Hardinge, late Secretary-at-War, has been unanimously chosen by the Government and East India Directors as Lord Ellenborough's successor. The following changes consequent upon Sir H. Hardinge's removal to India are mentioned as probable:—Hon. Sydney Herbert to be Secretary-at-War, but without a seat in the Cabinet. Hon. Mr. Corry to be Secretary to the Admiralty, in the room of Mr. Herbert. Mr. Cardwell, M.P. for Clitheroe, will probably have Mr. Corry's seat at the Admiralty board.

Church of Scotland.—The Queen has been pleased to appoint the Marquess of Bute to be her Majesty's High Commissioner to the General Assembly.

Fine Arts Commission.—The Queen has been pleased to appoint Lord Mahon and the Right Hon. T. B. Macaulay, to be additional Commissioners for the decoration of the new Houses of Parliament.

Foreign.

FRANCE.—The Paris papers contain long accounts of the addresses presented to Louis-Philippe on the occasion of his annual *fête* on the 1st of May, among which figure those from the foreign Ministers, the Chambers of Peers and Deputies, and the clergy. The most remarkable, indeed the only important one, is the address of the clergy, which was presented by the Archbishop of Paris, at the head of a deputation. The following is an extract from this address:—"The clergy take pleasure in declaring to you, Sire, that France is too dear to them for them to cede to any person the glory of being more submissive to her laws or more devoted to her honour. God grant that these benefits may not be insensible to men who are accustomed to see in an act of justice a motive for gratitude, and in the freedom of their ministry a new means of making the Government still more respected. This devotedness will be understood and preferred by the high wisdom of the King. He will deem it to be worthy of our pacific mission, of the loyalty of our character, and equally beneficial to religion and the country." The King replied:—"I thank you, My lord Archbishop, for the good wishes that you offer to me personally, and in the name of the clergy of Paris. I thought I had given pledges enough of my desire to maintain the liberty of religion and to surround the clergy with all the respect, all the veneration that are due to it, for it to become useless to remind me of them in the way I have just heard. What I can say to you is what you know already, that the clergy may rely upon all my good will, all my interest, and also on the constancy of my efforts to assure to France the benefits of religion, in order that it may continue to be at once the best guarantee against the vices which produce disorder in society, and the source of all the virtues which insure the happiness of men." This answer, on the part of his Majesty, has made a great sensation in Paris, and all the journals, excepting two, consider his Majesty's rebuke of the clergy as highly praiseworthy. The King, it is said, showed great symptoms of impatience during the time the Archbishop was reading his address, and his answer was delivered with great vivacity and warmth, which showed how displeased he was with the tenor of the address. So great was his excitement, that he was not even able to deliver the whole of the answer. He stopped in the middle of it, and merely added, "I have lost my voice, and cannot continue my answer;" and he at once turned away sharply from the Archbishop and his colleagues. In the Chamber of Peers the Secondary Instruction Bill is still under debate, but both the House and the public are getting tired of it. It was reported on Sunday that M. Villemain was so surprised with the turn the debate was taking in favour of the Church, and against the Bill, of which he had taken the responsibility, that he had tendered his resignation. Even if the rumour were true, it is not likely that under the circumstances his resignation would be accepted. There is no doubt, however, that the Church has gained in the course of the debate, and that its partisans are rising, both in their pretensions and confidence. The Prison Discipline Bill was still before the Chamber of Deputies. The sense of the House was declared on Friday to be adverse to extending to two hours the time (one hour per day) which the Bill proposes to allow to prisoners for air and exercise. The Chamber subsequently adopted the first 12 articles of the Bill. The prisoners (accused as well as convicted) are hereafter to be separated during the day and night. Each prisoner will have a spacious, salubrious, and well-aired cell.—In the Chamber on Saturday a petition presented by the operatives of Paris for the Abolition of Negro Slavery in the French colonies was referred to the Minister of Marine after an animated debate, in the course of which M. Guizot declared that it was the determination of the Government to abolish negro slavery in the French colonies, and that in their course they would be guided by the example and the experience of Great Britain. The French Government have determined to break up the Transatlantic steam packets, which were established at Havre, and to adapt the steamers for the service of the navy.—On Thursday the Duchess of Kent took an airing, accompanied by some members of the Royal family, and visited different parts of the capital. On Friday the Duchesses of Kent, Orleans, and Nemours, proceeded to the Holy Chapel and to Nôtre Dame, where they were met by M. Fontaine, the architect of the King, who waited upon the Princesses in their visit to those buildings. In the evening, the Duchess of Kent and the Royal family repaired to Meudon, where a splendid *fête* was offered to her Royal Highness. On Saturday the King and the Royal Family, accompanied by the Duchess of Kent, visited the Exposition of French Industry. The Duchess of Kent and Prince of Leiningen, accompanied by the Queen of the French and several princes and princesses of the Royal family, visited on Sunday the palaces of Versailles and Trianon. They walked through the park of Versailles whilst the waterworks were playing, and were everywhere greeted with lively acclamations. On Tuesday the Duchess of Kent, the King and Queen of the French, and the rest of the Royal family, left the Tuileries for Fontainbleau, where they were to remain until Thursday.

SPAIN.—Accounts from Madrid of the 29th ult., state that the discord which had prevailed for some days among the members of the Spanish Cabinet had caused an extraordinary confusion in that capital, and the determination of Ministers to resign in a body, which was carried into effect on that day, had tended to increase it. Added to this, a report got abroad that the Government was treating with the Pope respecting a reconciliation, and that orders had been privately issued to suspend the sale of the property of the secular clergy. It appears that on the Ministry tendering their resignations the Queen accepted them, and charged Gen. Narvaez with the formation of a new Cabinet. The following were at once nominated as its members:—Gen. Narvaez, President of the Council and Minister of War; the Marquis de Villuma, Minister for Foreign Affairs; M. Mon, Minister of Finance; M. Pidal, Minister of the Interior; M. Mayans, Minister of Justice; and Gen. Armero, Minister of Marine. The result of these changes was a considerable fall in the funds, from which they have not since rallied.

PORTUGAL.—We have advices from Lisbon to the 7th ult., announcing that the fortress of Almeida has surrendered to the Queen's troops. The telegraph states as follows:—"Viscount Fonte Nova communicates, that on the 28th April the rebellious troops which were in Almeida had given up at 4 p.m. of that day. The soldiers left their arms in the fortress, and marched before the besieging troops to the place to which they were ordered; but the officers escaped into Spain."

GERMANY.—The marriage of the Archduke Albert of Austria with the Princess Hildegarde of Bavaria was celebrated at Munich on the 1st inst.—A Frankfort journal states that the King of Prussia has ordered his Ministers again to present a bill to the States for the modification of the penal code, and that it is intended to abolish corporal punishment.—A letter from Dresden, of the 20th ult., says that a duel was lately fought at Tharandt, between the Count de Seckendorf and the Baron de Wender, both pupils of the Royal Forest School of that town, and neither scarcely 17 years of age. The weapons were pistols. Baron de Wender had the first fire. The ball entered the temple of his adversary, who instantly fell dead at his place. The young Baron fled, but has since been arrested at Freyberg, and will be brought to trial. The original cause of the meeting was a dispute at billiards.—The *Treves Gazette* publishes a letter from Frankfort of the 24th April, which says that "The German Diet is considering of measures to put an end to games of chance now authorised in the different watering-places; preliminary negotiations have already been opened for this purpose between Austria, Prussia, and other German Cabinets."

DENMARK.—Letters from Copenhagen state that the Danish people are beginning to occupy themselves seriously with the creation of railways. Companies have been formed in the capital, with the approbation of the King, the object of which is to establish the following lines:—1. In the Isle of Seeland—1st, A road from Copenhagen to Elsineur, which will be about 13 French leagues in length; 2d, Another which will traverse the Isle of Seeland in its greatest extent, and, going from Copenhagen by Rothschild, Ringsted, and Slaglese, to Coursour, situated upon the Great Belt, the length of which will be about 31 French leagues. It is by this route that the correspondence between the capital and the rest of Denmark is always expedited, as well as that passing between Copenhagen and the continent of Europe, during the season of the year when steam navigation is necessarily suspended on the Baltic. 2. In the Duchy of Holstein—Six lines, which will be connected with the great railroad now in the course of construction between Kiel and Altona, and with which they will complete an arrangement that will effect a junction between the principal towns of Holstein and those of the North Sea with the Baltic.—The Conservators of the royal library at Copenhagen have just completed the catalogue of its contents, a work upon which they have been engaged for 11 years. It forms 174 folio volumes, and comprises 463,332 volumes, without the pamphlets and single sheets. It has been presented in manuscript to the King of Denmark, and will be printed and published at the expense of the Government. The manuscripts in this library amount to about 22,000, of which only between 4000 and 5000 are yet catalogued.

ITALY.—A letter from Rome of the 23d ult., states that the College of Cardinals will be convoked in May as a Consistory, at the Vatican, when various promotions will be made, and religious affairs in Russia and Spain taken into consideration. General Bustamente, who has been twice President of the Mexican Republic, is residing at Rome. Cardinal Spinola is replaced as Legate at Bologna by Cardinal Vannicelli, who is succeeded at Forli by Cardinal Gizi. Letters from Bologna state that the sentences passed upon the last batch of the state prisoners tried before the Military Commission for the part they took in the attempted rising at Bologna last year, have been confirmed by the Roman Government. Among these prisoners are 14 against whom sentence of death has been passed, for having taken part in an engagement between the people and the soldiery at Savigno, where a captain of carabineers, four soldiers, and some volunteers were killed.—The dispute between Sardinia and Tunis on the subject of the exportation of corn, has been satisfactorily concluded.—The fact of the Prince de Canino, Charles Napoleon Bonaparte, having obtained leave to visit Naples for five days gave birth to a crowd of conjectures. His only object, however, was to arrange about the scientific Congress, which is to meet next summer at Naples. The King received the Prince at a private audience, was delighted with the plan, and promised to have the philosophers taken in the court carriages to the foot of Vesuvius.

GREECE.—Letters from Athens of the 6th, state that the Greek constitution having been officially published, the Ministers have tendered their resignation to King Otho, declaring their task was accomplished. The new Ministry is composed as follows:—Mavrocordato, President and Minister of Finances; Tricoupi, Foreign Affairs and Public Instruction, &c.; General Rhodius, War; Colonel Andreas Londos, Interior; Andreas Ch. Londos, Justice. The Ministry of the Marine is kept open, Mavrocordato taking the direction of it for the time. The two Londos are not of the same family, one being a native of Patras and the other of Vostitza. Although Colletti takes no share in the Ministry, he has written to say he will give it his cordial support.

BARBARY.—The *Maltese Times* of the 22d ult., announces that the Maltese Huereb, who had been condemned to death for the murder of a servant of Sir Thos. Reade, was beheaded at Tunis on the 12th ult.

UNITED STATES.—We have accounts from New York to the 8th ult., but they do not possess any news of political importance. It was expected that Mr. Calhoun would introduce the Texian and Oregon questions together in a short time, as the sympathy of the west might thus be brought to the support of Texian movement, and also to give time for negotiations with Mexico to become a party to the step. At present he is frequently engaged in conferences with our Minister Sir R. Pakenham. In the Bill before the House to prevent private expresses, Mr. Hanegan proposed to add a clause authorising the search of passengers' trunks and boxes, when they were suspected to contain letters—an invasion of the freedom of the subject that had caused some stir.—Professor Sanderson, favourably known as the author of "The American in Paris," died at Philadelphia on the 5th of April.—An American brig, Francis Lord, of New York, was reported to have been fired into by her Majesty's ship Alert, on the 2d Jan., when off the west coast of Africa. The vessel was afterwards visited by the lieutenant, and an unsatisfactory apology made.

INDIA AND CHINA.—The despatches from India, in anticipation of the Overland Mail which left Bombay on the 1st of April, have arrived this week. The most important item of news is the mutinous disposition which has recently manifested itself among the troops of the Bengal Presidency, formerly ordered for the relief of those of Bombay serving in Scinde. This has arisen from the refusal of Government to grant the usual allowances provided to the troops on foreign service, and which were paid to the troops in Scinde, considered a foreign country until last year. The money rations, being equivalent to about one-half of their pay, were withdrawn during 1840 and 1841, while the troops were in cantonments and freed from active service; they were again allowed them in January, 1842, when movements on an extensive scale became necessary, and were again withheld in 1843, when the troops returned to cantonments. The 64th Regiment of Bengal Native Infantry, having been directed to proceed from Loodianah, refused to do so until the extra allowance for foreign service was granted them, and though the point was conceded by Government, the regiment were despatched to Benares instead of Scinde, as formerly determined on; ultimately, however, this regiment came in, and are now *en route* to Sukkur. This mutinous spirit, however, seems to have pervaded almost the whole of the Bengal troops. The 7th Cavalry, with the 69th, 4th, and 34th regiments, and a company of artillery soon followed the same disgraceful step; and it was strongly suspected that these regiments (then at Ferozepore) had even gone so far as to correspond with the Seikhs. It is generally supposed, from the extensive character of this proceeding, that Government will allow the matter to drop, though it is probable that the 7th and 34th regiments may be drummed out, from the somewhat outrageous spirit they have displayed. Government, however, having granted far more than was asked, or even hoped for, by the malcontents, it is hoped that matters will now assume a better appearance in future among the native troops generally. The troops that served at Meeanee and Dubba have received a donation of a twelvemonth's batta, and those at Maharajpoor and Punniar six months' batta; and all the troops who have been in Scinde be-

twixt the 28th Feb., 1843, and the 28th Feb., 1844, six months' batta, in lieu of prize-money. About 50,000 will share in these donations. The Madras 47th Native Infantry, who refused to go to Scinde, have been sent off to Aden, and the principal leaders of the mutiny put in confinement for various periods. The accounts from Scinde, as regards the health of the troops, and the condition of the country generally, are satisfactory. The number of troops at Hydrabad amount at present to 4027, and of these only 467 were in hospital; of 1892 at Sukkur, 146; while at Shikarpore there were 1015, and only 54 in hospital. The Punjaub continues to get worse, and was likely to come to a crisis during the month. Gwalior is peaceful, and the remainder of the forces were expected to leave on the 1st March. The intelligence from Affghanistan is still conflicting, though the probability of Ukhbar Khan's marching on Peshawar was now generally believed in. A ball and supper, on an extensive scale, was given to Lord Ellenborough on his arrival at Calcutta. Nearly 1000 ladies and gentlemen, mostly of the Civil Service, were present. He intends shortly, it appears, setting out again to the north-west—and the conquest of the Punjaub is supposed to be his chief intent. India generally is quiet. The intelligence from China reaches to Feb. 27, but there is nothing of moment. Three of the pirates concerned in the murder of Dr. M'Kinlay, of her Majesty's 18th Regiment, and the three Portuguese sailors, mentioned some time back, have been seized by the authorities and ordered to be decapitated; and the leader of the gang, having been sentenced to be cut in pieces, escaped the punishment by dying in prison. Extensive robberies are still perpetrated at Canton and at the ports, despite the utmost vigilance of the authorities. The death of Assistant Commissary-General Irving is mentioned. He had only been a few weeks on the island, but his health was broken from his long residence on the coast of Africa.

Parliament.

HOUSE OF LORDS.

Friday.—The LORD CHANCELLOR, in moving that the House resolve itself into a committee on the Dissenters' Chapels Bill, stated its purport, and the reasons for its introduction. The object of the Bill is to stay much prospective litigation, of the same nature as that which has rendered Lady Hewley's charities familiar in Westminster Hall, and to every newspaper reader. For this purpose, it proposes to terminate all further legal controversy respecting the right to voluntary endowments connected with dissenting chapels, by vesting the property in the religious body in whose hands it may have been for the preceding 20 years.—The BISHOP OF LONDON opposed the Bill. It sanctioned the illegal use of a trust; and it would be *ex post facto* legislation to convey endowments, founded for religious purposes, to objects and opinions wholly contrary to those for which they were originally intended. It would be more just to take the first twenty rather than the last twenty years of the application of a chapel, as the evidence of the intention of the founder of the endowment. He moved that the bill be considered in committee that day six months.—Lord BROUGHAM supported the Bill, as tending to prevent much litigation, by rendering it unnecessary to inquire into the peculiar tenets of the founder, where there was an actual possession for 20 years. It was not an unusual thing for individuals to bequeath sums to chapels where doctrines were taught different from their own.—The Bishop of EXETER and Lord COTTENHAM both addressed the House at considerable length, against and for the Bill; they were followed by Lord CAMPBELL; after which the Bishop of LONDON intimated that he would not press his amendment, as he perceived he had no chance of carrying it. The whole Bench of Bishops then left the House.—Lord TEYNHAM opposed the Bill, after which the amendment was negatived without a division, and the Bill went through committee.

Monday.—The MARQUESS of CLANRICARDE moved a resolution censuring the appointment of Mr. O'Brien to the office of stipendiary magistrate in Ireland, which he considered calculated to diminish confidence in the impartial administration of justice.—Lord WHARNCLIFFE defended the appointment, contending that the charge was one in effect against the Lord Lieutenant and the Irish Government, which, in appointing Mr. O'Brien, intended to mark their disapproval of the Repeal agitation, by extending patronage to an individual who had seceded from it.—A short discussion followed, in which the Marquess of NORMANBY, Lord BROUGHAM, and the Earl of HARDINGTON took part; and, after a reply from the Marquess of CLANRICARDE, the motion was negatived without a division.

Tuesday.—Lord MONTEAGLE noticed an article which appeared in a newspaper on the subject of the proposed reduction of the interest on deposits in savings banks, and which was calculated to cause alarm to the depositors, for the purpose of cautioning depositors from withdrawing their money from those banks. He gave his opinion that the principle of the proposed reduction of interest was right and equitable.—On the motion of Lord BROUGHAM, the Creditors and Debtors Arrangement Bill was read a second time.—The Marquess of NORMANBY brought on a discussion respecting the reasons of the recal of Lord Ellenborough. He did not make a formal motion, as he was unwilling to press it, if the production of the correspondence were alleged to be injurious to the public service.—The Earl of RIPON replied, that, on his responsibility as a Minister of the Crown, he was compelled to refuse the correspondence; its production would cause great injustice to Lord Ellenborough, great embarrassment to his successor, and, above all, would be most injurious and inconvenient to the general administration of affairs in India. Although he deeply regretted the step taken by the Court of Directors, Lord Ripon said he felt fully persuaded they had been influenced in doing so by no other motive than an honest conviction that they were doing their duty to their country. Their motives, he believed, were sincere, but he refrained from passing any opinion on their policy; and he only asked as much on the part of their Lordships towards the Government and Lord Ellenborough.—Lord BROUGHAM spoke; and the Duke of WELLINGTON declared that he had no wish to effect an alteration in the charter of the East India Company, or to cripple the powers of the Directors.—The Marquess of CLANRICARDE, Lord COLCHESTER, the Earl of WINCHELSEA, and Lord CAMPBELL took part in the discussion, after which the subject dropped.—The Earl of DALHOUSIE, in reply to Earl FITZWILLIAM, intimated that as the whole subject of railway communication was under consideration of a committee of the House of Commons, it was not expedient that the House of Lords should interfere.

Thursday.—A number of petitions in favour of agricultural protection were presented by the Duke of RICHMOND and Lord REDESDALE.—The leading business was the third reading of the Dissenters' Chapel Bill, which raised some discussion, being opposed by the Bishop of EXETER, the Earl of WINCHILSEA, Lords KENYON, MOUNTCASHEL, and TEYNHAM. A division was taken, and the third reading carried by 41 to 9.

Friday.—The Royal Assent was given by commission to the following Bills:—The Exchequer-bills 18,407,000*l.* Bill, the International Copyright Bill, the Dean Forest Inclosure Bill, the Great Western and Cheltenham Railway Bill, the Norwich and Brandon Railway Bill, the South Western and Guildford Railway Bill, the Midland Counties Railway Bill, the Manchester and Leeds Railway Bill, the Norwich and Yarmouth Railway Bill, the Manchester and Birmingham Railway Bill, the Derby Junction Railway Bill, the Severn Navigation Bill, the Leeds Navigation Bill, the Birmingham Canal Bill, the Gloucester Market Bill, the Rochdale Gas Bill, the Liverpool Gas Bill, the Durham County Canal Bill, the Old Brickhill Estate Bill, and several other inclosure and naturalisation Bills.—The Lords Commissioners were the Lord Chancellor, the Duke of Buccleuch, and Earl Shaftesbury.—The Bail in Error Bill passed though committee.—The Recovery of Debts in Ireland Bill also passed through committee.—The Duke of RICHMOND moved for certain returns relative to the duty on foreign wools. In doing so the noble duke said, that it was natural that he should feel anxious on the question, seeing it was intended by the Government to take off the duty on foreign wool imported into this country; this he considered to be one step towards free trade. By reducing the duty the best interests of our Australian colonies, now already much depressed, would be still further injured. He thought the people of England ought to be treated like the growers of the Continent; the last time the wool duty was reduced the Americans laid an additional duty upon our woollen manufactures admitted into the ports of the United States.—The Earl of DALHOUSIE said he had no objection to produce the returns; he was not individually to say whether Ministers had had any communication with foreign powers as to whether they would make an equivalent reduction on their parts on the admission of English goods. This he would say, that the depression in the wool trade did not arise from the reduction of the duty; the importation of foreign wool was the means of enhancing the price of the home manufacture.—After some further discussion the returns were ordered.

HOUSE OF COMMONS.

Friday.—After Mr. ROEBUCK's speech on the impropriety of any interference with labour, the purport of which was stated briefly in our last, Sir J. GRAHAM said he was satisfied that due consideration for the working classes might be combined with an enlightened view of what was conducive to their best interests. The principle of the existing law was non-interference with adult labour; and the present Bill was but carrying out that protection to young persons which the Legislature sanctioned in 1833. It was true that the Bill interfered with adult female labour; and he confessed that this was a departure from principle. But it had been found that machinery could not be generally worked profitably and safely for a longer period than twelve hours; and the great majority of the manufacturers were favourable to such a restriction, in order to check the unfair operations of competing manufacturers, who brought odium on the great body, by working their machinery and their workpeople for a longer period. Females being the weaker portion of the community, were peculiarly entitled to their protection; and as it had been proved that twelve hours ought to be a limit for their toil, he took his stand upon this, which, though indirectly a practical interference with all adult labour, was calculated to be beneficial.—Mr. LABOUCHERE and Capt. ROUS supported Mr. Roebuck's amendment.—Lord HOWICK opposed it, on the ground that they had delayed interference too long. If they did not take a bolder course than they had hitherto done, there was great danger of their being overtaken by some frightful calamity. The Bill, though a feeble and hesitating commencement, was yet the prelude to this bolder course: in this view, it mattered little whether the twelve or the ten hours were adopted; having established the principle of interference, it would be impossible to draw back. Let them avert the injurious consequences, if these would result, by throwing down all artificial restraints and commercial monopolies, which lay at the bottom of the whole question.—Sir R. PEEL thought it was important that they should understand what was meant by "principles." General rules in legislation were matters of expediency rather than of rigid truth; and in passing a law, the rule should be, to consider if the good which would result from it would more than counterbalance the inconvenience of its enactment. He admitted that the care of national wealth was not the only duty of a Government; and freely confessed that the moral and intellectual improvement of the working population had been too much neglected by the Legislature. But if you laid down what was called a great general principle, and insisted on its general application, though individual cases of benefit might result, a system of intolerable domestic inquisition would be established, the people would be subjected to the supervision of a whole army of inspectors and sub-inspectors, their whole national character would be changed, and they would be trained to a helpless dependence on what Government could do for them. If a limitation to ten hours were followed, as it would be, by increased competition, and a struggle between profits and wages, and a diminution of the comforts of the workmen, the only consequence of this attempt to promote morality by law would be the defeat of their own object. The principles laid down by Lord Howick would justify a compulsory attendance at church. The people had grown up under a system of freedom of action, and the manly habits acquired by it would be entirely changed by interference. In certain cases where children were deprived of proper parental control, and with married females, they were bound to interfere and protect where necessary; and admitting that the principle of the Bill of 1833 was a correct one, the present Bill was an improvement of the law. It was true that the interference with adult female labour was an exception, and clearly a departure from principle; but the benefits which would result would more than counterbalance any inconvenience.—Lord J. RUSSELL said Sir R. Peel's speech was an able argument for the repeal of the Act of 1833, rather than a defence of the Bill before the House. He believed that the result of that Act had been beneficial; and in carrying interference farther he would be guided by facts and investigation into actual evils, and the best mode of remedying them. Mr. Roebuck, who had not gone very deeply into the question, had imputed motives to him and his friends, in the course which they had taken in supporting Lord Ashley's motion. The learned Member for Bath had better not interfere in this matter; he was hardly entitled to set himself up as the absolute wisdom of the House, or to question the motives of other men. Though opposed to the amendment he thought that interference should be confined to persons under twenty-one, and leading gradually to a limitation to ten hours.—Mr. WARD, Mr. C. WOOD, Mr. PHILIPS, and Mr. PARKER supported the amendment; Mr. AINSWORTH and Mr. FIELDEN opposed it.—Lord ASHLEY said he had intended to abstain from all share in this discussion, and to reserve himself for the debate on the limitation of the hours of labour but he would now bring forward documents, in order to substantiate his former statements respecting the condition of the factory population. A formal document, signed by Mr. H. Ashworth, had given a distinct contradiction to his allegations as to the distance travelled by the operative during a day. There was a difference between them; for while Mr. Ashworth's calculations were taken from the distance travelled by the spinner, he, Lord Ashley, had given the distance which the piecer had to walk, which was double; and a committee of 34 operatives had since confirmed his accuracy. Mr. Kenworthy, who had been an operative, and had risen to a partnership in one of the greatest establishments in Europe, had published a letter, in which he used language, in speaking of the evils of the factory system, stronger than anything that had proceeded from him; and he was confirmed by clergymen, residents, and workmen in manufacturing towns, who were familiar with what they described. With this corroborative evidence, which he adduced in considerable detail, he felt justified in affirming that his honour and integrity were vindicated, whatever opinion might be entertained as to the soundness of his judgment.—After some further remarks, the House divided—For Mr. Roebuck's resolution, 76; against it, 282; majority, 206. The House then went into committee *pro formâ* on the Bill.

Monday.—A new writ was ordered to issue for the borough of Abingdon, in the room of Mr. Duffield, who has accepted the Chiltern Hundreds.—The House went into committee on the Bank Charter, and Sir R. PEEL rose to move a series of resolutions respecting that charter and the banking system of the country. He observed upon the extensive effects which the decision of the House upon the matter of these resolutions must produce throughout all the transactions of society. The Act of 1833 had given to the Bank a term to expire in 1855, unless before August, 1844, notice should be given to the Bank that Parliament meant to deal anew with the subject. The Government now proposed that Parliament should exercise this power of notification. He was sure the House would address itself to the question without party bias: he would even ask, if it were permitted him to do so, that gentlemen would be content for that night to hear attentively, without expressing any opinion,—that they should reserve all observations until they should have taken time to consider the suggestions of Government. He adverted to the manifesto put forth by the country bankers; he would not blame them, in a matter affecting their own interests, for having thus solicited the aid of Members towards a combined resistance; but he must express his hope that members would deem it their duty to decline that indiscriminate invitation. It would be necessary for him, he said, in the first place, to consider the principle of value; because, he feared, there was not a universal agreement as to what really constituted the measure of value. First, he would inquire, what was a pound? and what was the engagement to pay a pound? Surely, the word "pound" meant something more than an abstraction; in his opinion, it meant a certain weight of precious metal of a certain fineness, and the engagement of a maker of a promissory note was to pay on demand a definite amount of that metal and fineness. A real measure of value, in this just sense, had existed till the year 1797, when bank paper became issuable without convertibility into metal. For some years the subject attracted little attention, until the Bullion Committee of 1810 propounded a sounder theory. That theory, however, was then unsatisfactory to a great part of the public; and a notion became very general that a pound was merely an abstraction. He quoted some of the current definitions of that time, whose vagueness excited a good deal of laughter. Similar inaccuracy of opinion seemed to prevail at this day, if he was to judge from the pamphlets now in circulation, particularly from one lately published at Birmingham. It was said, that the change of times required a new standard of value; but just as reasonably might it be urged, that because population had increased, and the railway system widely extended, the foot measure ought henceforth to contain 16 inches. The reason why an ounce of gold cost 3*l.* 17*s.* 10½*d.* in silver was, that this is the real proportion of the one metal to the other; and if you meant to give a certain advantage to all debtors, you should do so by way of a direct discount, and not say that an ounce of gold, really worth 3*l.* 17*s.* 10½*d.* of silver, shall be worth 5*l.* for the future; for here the dealers in those metals would assuredly defeat you. Some writers had argued that gold was unfit to be a circulating medium, because it was an article of commerce; but that was the reason which in his judgment made it peculiarly fit to be a circulating medium. If any man could controvert his definition of a pound, and of an engagement to pay a pound, let that man produce his own definitions. He would now state his views respecting the principle for the regulation of a paper currency. He took a clear distinction between bills of exchange and those promissory notes which, being payable to bearer, served the direct purposes of money. The first Lord Liverpool, a high authority, had enforced this important distinction between paper credit and a paper currency. In his time, as in ours, the attempt was made to deter the State from improving the paper currency, by the fear of injuring paper credit. Adhere to the standard of value and to the principle of convertibility for your promissory notes, and there will be nothing to fear from any quantity of bills of exchange. But he did not agree that mere convertibility was of itself a sufficient guarantee against an overissue of promissory notes. Observe the fate of the American issues, and the paralysis which had followed that case was a strong illustration that convertibility alone was not a sufficient guarantee. He would now state the outline of the practical measures which he was prepared to recommend. The Bank of England was the instrument by which he proposed to regulate the future issues of circulating paper. With this view he would divide that establishment into two wholly distinct departments, one for banking and one for issue, with separate accounts and separate officers. The future issues would rest on two foundations. The public bringing bullion would be entitled to receive notes for it, as, conversely, they would be entitled to receive gold for their notes, and bullion, therefore, would be one foundation of issue. The other would be securities; and the amount issuable on these would be limited to 14,000,000*l.*, of which 11,000,000*l.* would consist of the loan borrowed of the Bank by the public. There would be a complete publicity of the banking accounts and the issues, which would be announced weekly. With respect to other banks, he was of opinion that their general banking operations were not properly the subject of control; but with respect to issues the public had a right to intervene; and he proposed, therefore, that no new bank of issue should be established, and that banks already existing should not increase the amount of their issues, to be calculated upon an average of the last two years. He intended to ask some legal facilities for general banking, by giving power to joint-stock banks to sue and be sued, by removing the present disability of the metropolitan joint-stock banks to accept bills at a shorter date than six months, and by some other accommodations. He would require, on the other hand, the frequent publication of the partners' names and of the issues, but not of the general affairs of the private and joint-stock banks. The terms which had been negotiated with the Bank of England for these new arrangements were (in addition to the particulars before specified) the continuance of the already-mentioned loan of 11,000,000*l.*, and an annual payment by the bank to the public of 60,000*l.*, in addition to the price of 120,000*l.* a-year, which they paid for their already-existing privileges. The new arrangement would endure to the Bank of England for 10 years, subject to revision by Parliament, and the private and joint-stock banks would be liable to a reconsideration of their position by Government at the end of 10 years, when it might be deemed expedient to concentrate all banks of issue into one. For Ireland and Scotland he did not propose to legislate at present, except to the extent of prohibiting new banks of issue, and of requiring that the new banks, not of issue, should be subject to registration, and to certain other checks to be exercised by the Government. Sir R. Peel, after going fully through these propositions, recapitulated them all in a more summary form, observing that the effect of the control to be vested in the Bank over issues of paper would be to place those issues under the influence of the foreign exchanges. Having thus stated his outline, he hoped that the House and individual members would abstain from pronouncing any opinion; then, especially as he intended to lay before the House the correspondence of the Government with the Bank of England, which must necessarily throw much additional light upon the whole subject. He concluded by alluding to the satisfaction which he, as the author of the Currency Bill, must receive from the complete fulfilment of his own principles,—and to the still greater gratification which on public grounds he should feel, in having

been able to provide a security for the middling and humbler classes against the dangers, the losses, and the anxieties which, in past time, they had endured from the circumstances and failures of the currency. Several questions respecting small points of the plan were put to Sir Robert Peel across the table.—The Chairman of the committee then read the resolutions, which contained, in separate propositions, the plan of the Government. These resolutions were passed and reported; and the House then went into committee upon the details of the Factories Bill. Some discussion arose on the 30th clause, limiting the time of children's work to six hours and a half, or in some cases seven hours. Mr. WARBURTON observed, that though it relieved the individual children whose working time it shortened, yet, by creating a necessity for so many more children to do the work, it increased the total number of children compressed into the large towns, which was the evil chiefly denounced by Lord Ashley. The clause, however, passed without a division.—On the 32d clause, for protecting adult women and young persons, Lord EBRINGTON in a few words objected to the principle of legislating upon contracts of adult labour, and moved the omission of the clause.—Mr. HUME considered that enactment had a tendency to encourage prostitution.—Mr. F. MAULE objected to it as an interference with adult labour.—Mr. HINDLEY thought it an unnecessary clause.—Lord EBRINGTON said he had wished only to mark his opinion, and would not divide the Committee.—Mr. HUME, however, was not disposed to let the matter pass so easily, and insisted upon dividing. The numbers were—for the clause, 161; against it, 22: majority for it, 139.—The discussions on the remaining clauses had nothing of material interest.

Tuesday.—Sir R. PEEL read a letter from Captain Drummond, who, in command of the sloop-of-war Scout, when off Alicant, had been charged with refusing to receive the unfortunate insurgent Bonet, by which he fell into the hands of the Spanish troops. From the statement, it appeared that Bonet only once came on board the Scout, and, in his capacity of governor of Alicant, offered the British officer any assistance he might require, but he had never applied in his distress; and the Scout left Alicant the day before it was entered by the Spanish Royalist troops.—Mr. HUME, in moving for the production of the correspondence between the Court of Directors of the East India Company and her Majesty's Government respecting the recall of Lord Ellenborough, explained shortly the nature of the powers vested in the Court of Directors, of whom twenty-three present (the twenty-fourth being absent ill) concurred in the present exercise of it. It was of great importance to the welfare of India that the Court should stand well with those whom it governed; and as the majority of those who had recalled the Governor-General were supporters of the Government, the presumption was, that it was a wise and well-considered act, notwithstanding the censure of indiscretion so repeatedly and freely bestowed on it by the Duke of Wellington. The production of the correspondence would set dispute at rest.—Sir R. PEEL deprecated anything which would bring on discussion respecting the conduct of Lord Ellenborough in his absence, considering the actual circumstances which had been felt by Mr. Macaulay to be of sufficient weight to postpone his motion respecting Gwalior. But a consideration of the welfare and tranquillity of India afforded a stronger reason for resisting the motion. No doubt a difference of opinion existed between the Government and the Court of Directors as to the policy of Lord Ellenborough, but looking to the great responsibility of the government of India which had thus devolved on them, he had felt it his duty to merge all previous differences in cordial conjunction in the choice of a successor. He, Sir R. Peel, had named Sir Henry Hardinge to the chairman and deputy of the Court of Directors; these gentlemen instantly replied that the same name had occurred to them; and, therefore, Sir Henry Hardinge was induced to accept the appointment, not, as he firmly believed, from any motive of personal ambition, but from the highest and purest sense of what was due to the public interest. No consideration, therefore, would induce him to fetter the action of the new Governor-General, by suffering the same mail which accompanied his departure to carry out a detailed correspondence of the circumstances attending the recall of his predecessor, and he hoped the House would sustain him in his determination.—Mr. ANSTELL said that the Court of Directors had been accused of indiscretion; they would not add to it by the production of the correspondence. In recalling Lord Ellenborough, they had acted from a sense of public duty.—Mr. HOGG also said that the Court had acted under an imperious sense of public duty, and he for one would rather submit to imputation than vindicate their conduct by anything which might be detrimental to the public interest.—Mr. MACAULAY remarked that the Court of Directors had been accused of being guilty of the gravest indiscretion known in our times—an indiscretion greater than the Walcheren expedition, or the Bill of Pains and Penalties against Queen Caroline. A charge involving so much recklessness and rashness, and made on such authority, should be substantiated, otherwise responsibility was a mere name. Sir R. Peel had avoided the question; with his usual skill he had glided from the past to the future. As one of those who had been concerned in framing the new constitution of the East India Company, he contended that the Court of Directors ought to have the power of recall, and that they would not suffer it to be taken from them without a long and obstinate struggle. He saw that the Court of Directors had been unanimous; he found men in it well acquainted with India, ten of them being men the most ignorant of whom knew more about the character of the ninety or the hundred millions whom they governed, than, with all deference to the ministerial benches, the whole of the gentlemen who occupied the Treasury benches. Nor were the Directors Whigs, and liable to imputations of party feeling; the majority were Conservatives, and supporters of the Government. If they were to suspend their judgment, it should be with no bias against the decision of the Directors; and if, next session, when Lord Ellenborough might be in this country, the Government still refused to produce the correspondence, the conclusion was inevitable that they dare not.—Mr. MANGLES opposed the production of the papers.—Lord J. RUSSELL did not think it advisable to press for them until after the return of Lord Ellenborough.—Mr. HUME insisted on a division. There were—for his motion, 21; against it, 197; Majority, 176.—Lord J. MANNERS moved for a select committee to inquire into the operation of the laws of mortmain, upon bequests to charitable and religious institutions, and into the expediency of revising the same.—Sir J. GRAHAM, although he opposed a similar motion, by the Noble Lord last year, was not now prepared to say that it was not advisable to inquire into the changes that had taken place in the operation of those laws in process of time. With respect to the policy of such laws, he thought that the House itself was the best place to discuss that part of the subject.—The motion was agreed to.—Sir W. HEATHCOTE obtained leave to bring in a Bill to facilitate the collection of county rates, and to release high constables from compulsory attendance at quarter sessions.—The report of the Factories Bill was brought up, and the third reading fixed for Friday.

Thursday.—The third reading of the Leeds and Bradford Railway Bill was carried by 73 to 21.—Mr. LABOUCHERE called attention to the dismissal of a thousand women from colliery employment in Staffordshire, by the magistrates there, acting under a strained interpretation of Lord Ashley's Act.—Sir J. GRAHAM admitted the fact, and said that the matter had been referred to proper legal consideration, and meantime farther action under the powers of the law was discontinued.—Mr. HUME moved an address to the Queen, praying her Majesty to be graciously pleased to consider whether it would not be for the advantage of Ireland, and for the interest of the United Kingdom, to abolish the office of Lord Lieutenant of Ireland.—Captain BERNAL seconded the motion.—Lord ELIOT argued that, at the time of the Union, there was a tacit understanding that the seat of government should remain in Dublin, an idea in accordance with the feelings of the people. So far as his own experience went, he denied the existence of any jobbing, or the interference of subordinate and irresponsible individuals, in the Irish government; and pointed out that it would be no easy matter to transfer from the Lord Lieutenant to a fourth Secretary of State all the varied powers of the many acts of Parliament, the execution of which devolves on the former. The manifold duties of the Irish executive required a large staff of secretaries, clerks, &c; and the law adviser, if not formally a responsible officer, was at least a very necessary one, inasmuch as a practice existed in Ireland not known in England, that of every paid and unpaid magistrate, and heads of the constabulary, referring to the Government for advice in every case of difficulty. Scotland was not an analogous case, for there there was no disposition to resist the law; and in a country like Ireland, distant as it was from London, it was of great importance that there should be an officer of the high rank of the lord-lieutenant, to act in all cases of emergency, and to administer the law. The people of Ireland would view the abolition of the office with great dissatisfaction.—Lord J. RUSSELL said that the propriety of abolishing the lord-lieutenancy had been at one time under his own consideration, and the conclusion which had been come to was, that it was not then expedient to abolish it. But his own opinion was, that the present mode of governing Ireland by a separate establishment was not the best. He saw no great difficulty in assimilating the government of Ireland to that of Scotland; even the somewhat formidable objection of the great number of references from inferior magistrates arose from the facility which was afforded by the comparative vicinity of the Castle in Dublin, by which these functionaries were tempted to throw all their difficulties and responsibilities on the lord-lieutenant. Though favourable to the abolition of the office, he thought it a matter for the consideration of the Executive rather than of the House, and he would not on that ground support the motion.—Mr. SHAW and Capt. LAYARD opposed, and Mr. BELLEW supported the motion.—Sir R. PEEL impressed upon Hon. Members, that unless they were prepared to abolish the office incontinently, they ought not to vote for the motion. The power and efficiency of the Lord Lieutenant, he said, might be greatly affected if the House of Commons, by its vote, declared that the office ought to be abolished. He should be sorry to express an opinion in favour of the permanent continuance of that office. He thought that the first impression that would present itself to the mind was, that England, Ireland, and Wales should be governed in the same way. But he should most strongly deprecate any resolution which would weaken the authority of the Lord Lieutenant until they were prepared to consider what they would substitute if they abolished the office.—Mr. HUME upon this withdrew his motion.—Mr. BUTLER moved for a copy of an opinion and advice given by Mr. Pennefather, the present Chief Justice of the Court of Queen's Bench in Ireland, on the 28th February, 1820, in a case of toll, namely, "Pembroke *v.* Kingsmill," in which the corporation of Kilkenny was interested, the original of which is in the possession of the present mayor and corporation of that city. The advice of Mr. Pennefather was to this effect:—"I advise that a person should be produced to search amongst the corporation papers, and in other depositaries of public records, to see if there is any patent anterior to that of James I., and that none such has been found; and that this proof should be given by some person who is altogether a stranger to the patent of James II., and that good care be taken to keep that patent out of his way wherever he went to search."—Lord ELIOT said that the document being the private opinion of a counsel to a client, was not one which the House could call for. There was no doubt of the accuracy of the opinion, but it referred to an invalid charter, the production of which would only embarrass the case. There was nothing in it to impeach the honour and the integrity of the Chief Justice.—Mr. SHAW was authorised to say, that though Mr. Pennefather had no precise recollection of having given such an opinion in the actual terms attributed to him, yet he was ready to assume the fact, and to defend it. Mr. Butler was himself incapable of that of which he was made the instrument—an attempt to overawe the Chief Justice. The proof to be given in the case was the non-existence of an anterior patent; there was an anterior patent, but it was a repudiated one; and the advice given was, that this repudiated patent should be kept out of the way of the searcher, in order that he might be able to give evidence as to non-existence. The practice of giving such advice was quite usual amongst lawyers. The motion was an attempt to intimidate; in proof of which Mr. Shaw read an extract of a private letter from the Chief Justice, in which he so characterised it, and said that, during the progress of the State Trials, he had received letters full of abuse of himself, and of threats and menaces towards his family, of which, though he did not complain, yet he grieved, in so far as the administration of justice was concerned.—After some further discussion, the motion was negatived without a division.

Friday.—Sir W. FOLLETT Attorney-General took the oaths and his seat for Exeter. On the motion of Lord F. EGERTON, a new writ was ordered for South Lancashire. The Blackburn and Preston Railway Bill was read a third time and passed, and the Liverpool Docks Bill was recommitted.—Sir J. GRAHAM moved the order of the day for the third reading of the Factories Bill. After a number of petitions in favour and against a ten hours bill had been presented, Lord ASHLEY rose. He said, after the three distinct delarations that had been made by the House, he need not make any further attempt, by argument or persuasion, to influence the feeling and understanding of the House. It had, by three distinct declarations, decided actually in three cases, that the period of labour should not amount to twelve hours, and in two cases virtually that the period of labour should not exceed ten hours. On those decisions the world at large expected that a middle term would have been taken, but her Majesty's Ministers had refused to consent to that term. They had invited a revival of the debate, by calling on the House to reverse these decisions, and therefore they who stood by the whole of these decisions, and who protested against this novel and somewhat questionable course, were not to be charged with wearying the attention of the House, or wasting its valuable time, if they did endeavour to urge every argument and move every consideration that could countervail this prodigious exercise of ministerial influence and official authority. With respect to the moral and physical condition of the people, one way or other, the minds of all were made up; it was even admitted by many of their antagonists that if a reduction of the hours of labour could be effected without injury to the workman or the master manufacturer, it would be desirable to effect it. But they said a danger would arise to the workmen's interests, and he who proposed the plan, was actually charged with being more inhuman than those who resisted it. But he wished to reject altogether the use of such epithets, and he would not in any way retort the imputation cast upon him of malignity and of cant. In the whole of those debates there was but one thing that he regretted; he did most deeply regret that he should have been charged with calumniating the whole body of master manufacturers. He totally disclaimed that charge. He should be ashamed of himself if he presumed, either there or elsewhere, to use such language of a class of men, who could boast of as many munificent and worthy individuals, as could be represented by any class which had ever supported or adorned the institutions of this country. Neither because he addressed himself to a particular evil, was he to be considered as an enemy to the factory system. He firmly believed—for he had laboriously examined many of the mills—that if they removed some of the imperfections of factories, they would become a blessing, if not absolutely, certainly and relatively to the labouring classes. Now, when he first introduced this question, he did not touch upon the commercial argument, because he did not consider it necessary in the view which he took of the question, nor did he consider it necessary now. But he owed it to those whose interests he represented, to show that he had not left any part of the question unconsidered; that he had not rushed like an enthusiast, into this career, not caring what consequences might ensue from the attainment of this end. He said at that time what he now said, that what was morally wrong could not be politically right; he had then, and he had still, the deepest conviction that that which was morally right could not be politically wrong. All that he had read, all the consideration which he had been able to give to the subject, all the intercourse which he had had with persons who, from their practical experience, were the best able to instruct him, confirmed him in this conclusion. And now he must entreat of the House with very much respect, and with very much earnestness that they would be good enough to give him their attention while he went through a statement which was at all times dry, and which would he feared be much drier when coming from him, and which was moreover somewhat trite. Now, after much inquiry he could discover no more than four leading arguments against this measure, and those arguments were comprised in the petition from Manchester which had been laid upon the table of the House. Those four arguments were that the passing of the Ten Hours Bill would cause additional employment—that there would be in the same proportion a reduction in the value of the fixed capital employed in trade; that there would be a great diminution of wages to the great injury of the workmen; and lastly, that there would be a rise in prices, and consequent danger from foreign competition. Now, upon these four points the commercial argument rested. His lordship then entered at great length into the details of these points, and concluded by moving that after clause 31 in the Bill, the following clause be added.—"And be it enacted, that from and after the 1st day of October, in the present year, no young person shall be employed in any factory more than eleven hours in any one day, or more than sixty-four hours in any one week; and that from and after the 1st day of October, 1847, no young person shall be employed in any factory more than 10 hours in any one day, or more than 58 hours in any one week; and that any person who shall be convicted of employing a young person for any longer time than is in and by this clause permitted, shall, for every such offence, be adjudged to pay a penalty of not less than 3*l.*, and not more than 10*l.*"—[Left sitting.]

CITY.

Money Market, Friday.—Consols for account closed at 99¾. Red. Three per Cents. 99⅛ to 98⅞. Three-and-half Red. 102 to 101¾. New Three-and-half, 102⅞ to ⅝. Bank Stock, 196; India Stock, 288; Exchequer-bills, 76 to 78 prem.

BANKRUPTCY SUPERSEDED.—G. and R. CAVE, of Banbury, Oxfordshire, drapers—H. TAYLOR, of Bilston, Staffordshire, victualler—G. B. SALVI, Duke-street, Portland-place, wine-merchant.

GAZETTE OF THE WEEK.—BANKRUPTS.—E. HOLMES, of 8, King-street, Cheapside, warehouseman—H. SIMMONDS, sen., late of High-street, Southwark, and now of Long-acre, hop factor—W. H. NASH and W. GARDNER, of Exeter, drapers—T. COX, of Porchester-street, Connaught-square, fruiterer—C. WILLIAMS, of 12, Sutton-street, York-road, formerly of 8, Friday street, Cheapside, furrier—T. W. BAKER, of Woolwich, builder—J. BIRD, of 11, St. John's-square, Clerkenwell, watch manufacturer—J. MOORHOUSE, of Rotherham, Yorkshire, cattle-dealer—W. F. NICHOLSON, of Warley, Yorkshire, worsted-spinner—H. PEACOCK, of Stockton-upon-Tees, Durham, grocer—S. MEREDITH, of Liverpool, linendraper—W. HIND, of Preston, Lancaster, common brewer—F. DAVIS, of Tipton and West Bromwich, Staffordshire, linendraper—J. ARNOLD, jun., of Farndon, Chester, and H. ARNOLD, of Derby, cheese-factors—M. BRUNSWICK, Lime-street, London, merchant—J. ELLIOTT, Caxton, Cambridgeshire, innkeeper—F. BANNER, Upper Thames-street, City, provision-merchant—J. CLARK, Mincing-lane, Fenchurch-street, colonial-broker—R. S. SAXBY, Old Fish-street, City, wine-merchant—C. STYLES, Worthing, Sussex, grocer and tea-dealer—T. KEMPSTER, Blackman-street, Southwark, builder—S. WOODROFFE, Chepstow, Monmouthshire, wine merchant—G. PARKER, Sheffield, spade and shovel-manufacturer—J. DIXON, Sheffield, linendraper.

Metropolis and its Vicinity.

Royal Academy.—On Saturday the President and Members of the Royal Academy gave their annual dinner at their apartments in Trafalgar-square, which was attended by Prince Albert, the great Officers of State, the Judges, and a large number of Peers, Members of Parliament, &c. The private view of the pictures took place previous to the dinner, and on Monday the exhibition was opened to the public.

Literary Fund Dinner.—The 55th Anniversary of the Literary Fund was celebrated on Wednesday in Freemasons' Hall, the Marquis of Northampton, President of the Royal Society, in the Chair, supported by the Danish Minister, the Earl of Arundel and Surrey, Lord J. Manners, Lord R. Grosvenor, Lord Bolton, Viscount Adare, Viscount Emlyn, Sir John Barrow, Sir Robert Inglis, by several Members of Parliament, and a large number of Fellows of the Royal Society. The Report stated that the sum distributed by the Society in relief to distressed Authors and their families, during the past year, was 1145*l.*, making upwards of 30,000*l.* applied to these benevolent objects since the foundation of the Society. The Chairman, the Earl of Arundel and Surrey, Professor Owen, Mr. Milnes, M.P., Mr. Gally Knight, Mr. Serjeant Talfourd, and other gentlemen addressed the meeting, and donations were announced to the amount of upwards of 800*l.*

Excise Seizures.—Suspicion having been excited that spirits were sent from Messrs. Smith's distillery, at Whitechapel, to be rectified at a higher strength than is legally allowed, a supervisor of Excise proceeded last week to the premises, and on examination found that a large stock, just about to be sent away, was considerably above the legal strength, and the answers to his questions not being satisfactory, he seized the whole, consisting of 21 puncheons, and containing 2310 gallons of plain British spirit, which were conveyed to the Excise warehouses, to await adjudication by the Commissioners.—On Thursday week, in consequence of information received by the police, a seizure was made of an illicit still, which was found underground, adjoining a cottage-built house, at Barrow-well-green, near Edmonton, and which has been since ascertained to have had manufactured by it every week, a very large quantity of spirits. There was a lawn in front, and at the back of the cottage a paddock, two fish-ponds, and out-houses. The occupier, whose name is supposed to be Goodwin, and who described himself as a butter-merchant, kept his horse and chaise. Upon making a search, the officers discovered an aperture leading under ground, which was fastened by a door. They removed this, when they discovered the illicit stills, which were capable of making about 20 gallons of spirits in each. There was a

quantity of tubs, tin cans, butter casks, bladders, wort, &c. The butter casks were lined inside with tin. There were pipes communicating underground with the ponds, from one of which the water was supplied, and the other pond was made the recipient for the smoke. The apparatus was broken up, and taken possession of by the Excise. There were three men, a female, and a boy, on the premises, but they were not taken into custody, as the still was not at work. It is stated that the manufacturing of spirits has been going on for a period of above eighteen months. The neighbours considered for months that the occupant of the cottage was in the butter trade, as they used repeatedly to see him leaving and returning with the butter casks.

The Battersea Murder.—On Saturday morning, a few minutes after one A.M., Augustus Dalmas, the person suspected of having murdered Mrs. Macfarlane, on the night of Monday week, on Battersea-bridge, surrendered himself to the police on duty at the Marylebone Station. After he had been identified, he was removed to the Wandsworth Police Court, when he was examined before the magistrate. The prisoner, who is a rather stout and good-looking man, appeared very composed. His face, however, was swollen, and his eyes bloodshot, as if he had been shedding tears copiously. He stood, to all appearance, perfectly unmoved, except when his daughters were being examined, and then he appeared uneasy at, rather than affected by, their presence. The evidence adduced was given at great length, and was merely a recapitulation of what had passed last week before the Coroner's jury, when the facts stated in our last were given in detail by the numerous witnesses examined. It is unnecessary to repeat what is already known to our readers, and few new facts were stated. The prisoner, on surrendering himself, denied that he had been on the bridge at all, stating that he had left deceased at the Middlesex side, and that he was entirely innocent of the murder. He said that the newspaper accounts were full of inaccuracies, and that he gave himself into custody because he was hunted to death. Among the witnesses called was his daughter, Charlotte Georgiana Dalmas. The instant she entered the Court and beheld her father at the bar, she fell back fainting into the chair. Some water was given her, and she partially recovered; but when she again beheld her father she went into hysterics, and screamed in the most heart-rending manner. It was found necessary to remove her from the Court, and proceed with the evidence of another witness. She was not recalled. The prisoner, on seeing the sufferings of his daughter, shed tears; but immediately afterwards became perfectly composed. At the termination of the evidence of each witness the prisoner was asked by the magistrate if he wished to say anything, but each time replied, "Nothing," until Mr. Connor, surgeon, had given his testimony, when the prisoner asked him if it was possible that a woman could have walked so far as had been represented after having her throat cut. Mr. Connor replied that it was. The police constable and the landlord of the Swan, having been examined, Inspector Busain applied for a remand. After some consultation, the magistrate, addressing the prisoner, said—I am disposed to remand you until Friday; do you wish to to say anything? Prisoner—No, not at present. The witnesses were then taken into another room to give their depositions, and the prisoner was removed to Horsemonger-lane. The Coroner's jury, at the adjourned inquest on Monday, returned a verdict of Wilful Murder against the prisoner.

The Case of Mary Furley.—The sentence of death upon Mary Furley has been commuted to imprisonment in the Penitentiary at Millbank.

The Anti-State Church Conference.—Last week delegates from all parts of England, Ireland, and Scotland, met at the Crown and Anchor as a convention, to consider the best means of obtaining the severance of Church and State, and adopt measures for the furtherance of that object. Upwards of 1200 delegates were present, amongst whom were Dr. Bowring, M.P.; Mr. S. Crawford, M.P.; Mr. Trelawney, M.P.; Mr. Jos. Sturge, Rev. Dr. Pye Smith, Rev. Dr. M'Farlane, &c. A large number of ladies were on the platform. The Rev. J. Burnet, of Camberwell took the chair, and Dr. Cox read a history of the origin of the Conference and its object. Mr. S. Crawford, Dr. Bowring, and others addressed the company: resolutions were carried to enter Dr. Cox's paper on the records of the Conference, and to affirm that the Conference was not a demonstration of Nonconformist strength. Several papers were read on the efficacy of the voluntary principle, and after sitting for three days it was resolved that a society be formed to be entitled—"The British Anti-State Church Association," and that a conference should take place once every three years. An executive committee and a council were appointed, and the modes of action to be adopted by the Association were also settled.

Wesleyan Missionary Society.—The anniversary meeting of the members of this body was held on Monday at Exeter Hall. The proceedings were advertised to commence at 11 o'clock, but long before that hour every available place was occupied, and many who had possessed themselves of tickets were obliged to go away disappointed. The Right Hon. Sir G. Rose, G.C.B., filled the chair, and was supported by Mr. P. M. Stewart, M.P., and a great number of Dissenting Ministers. The chairman addressed the meeting at some length, laying particular stress, as being himself a Churchman, upon the necessity of encouraging that kind and kindred feeling between the Church of England and the Wesleyan body, which he was glad to see to a very considerable extent did exist. Dr. Bunting and Mr. Beecham then read the annual reports, which stated that in Ireland, as well as in Germany, France, Switzerland, Gibraltar, the south of India, Ceylon, New South Wales, Australia Felix, South and Western Australia, Van Diemen's Land, the Friendly Islands, the Teeje Islands, the Albany, Kaffraria, and Bechuana districts, Sierra Leone, the West India Islands, and British North America, the Society's missions were generally in a highly satisfactory state. At Wairau, in New Zealand, however, the mission, in consequence of the melancholy collision between the authorities and the natives, has been suspended; and in the Cape of Good Hope sickness had created great ravages amongst the missionaries. The Society has at present 274 stations in various parts of the world, 387 missionaries, 1640 other paid agents, 4884 unpaid agents, 101,137 full and accredited church members, 5066 persons on trial for memberships, 64,307 scholars, and seven printing presses. The gross receipts during the year 1843, including a previous balance of 523*l.* 13*s.* 6*d.*, amounted to 110,620*l.* 0*s.* 3*d.*; and the expenditure to 112,908*l.* 5*s.* 2*d.*; being an increase over income of 2288*l.* 4*s.* 11*d.*—the old debt of 30,000*l.* being, however, now completely paid off. On the motion of Mr. P. M. Stewart, M.P., seconded by the Rev. Mr. Reece and Dr. Wilson, of Bombay, the report was unanimously adopted. A resolution, expressive of gratitude for the beneficial results which had attended the operations of the Society, and several other resolutions were adopted.

Metropolitan Improvements.—The Commissioners of Woods and Forests have decided upon the plans to be carried into effect for the formation of a new avenue, to be called the Queen's Road, extending the whole length between the Uxbridge-road and the High-street, Kensington. Various plans have been submitted to the commissioners, and those of Mr. Owen Jones, Messrs. Wyatt and Brandon, and Mr. Kendall, have been accepted, and operations have already commenced. The plans selected, which are all in the pure Italian style, are designs for mansions of a grandeur seldom seen in a private thoroughfare. Some of the houses will contain upwards of 40 rooms, and in most are apartments, *en suite*, upwards of 150 feet in length. The greater portion of these buildings are secured by aristocratic and wealthy families; and a lessee under the Crown has undertaken to have them ready during the forthcoming summer. The villas on each side will command a view of Kensington Gardens. The road will be upwards of a mile in length, and 70 feet wide, except at the south side—thus connecting both the great western roads. It is the intention of the commissioners to erect gates at each end, and double sets of lodges, to be inhabited by liveried gatekeepers, assisted by supernumeraries, in keeping up an efficient police.

Wood Pavement.—Last week Mr. Kelsey the engineer, presented his official report on the wood pavement in Leadenhall-street, St. Paul's Churchyard, and the Old Bailey, to the Commissioners of Sewers. The reports stated that all these specimens of wood-paving had been constantly under repair since they were laid three years ago, and that in some instances the wood was worn down to the pins. Mr. Kelsey concluded by saying, "Upon a careful consideration of the present state of all these specimens, and of the effect which the constant transit of carriages has had, and may have upon them, I cannot but feel that the result of the trial of wood pavement, as to this particular kind, is far from satisfactory in point of durability; and although, with the chance of summer weather before us, it must reasonably be supposed that they will wear yet a little longer, I quite expect that before winter they will be dangerous to pass over; that they must then be taken up and wholly relaid, and a very large portion be replaced by new material." Sir P. Laurie, after the Court broke up, sent a copy of Mr. Kelsey's report to the Commissioners of Woods and Forests, who directed their secretary to write an official letter to Sir Peter, to inform him that they had come to the resolution to lay down no more wooden pavement in the metropolis. At a subsequent meeting of the Commissioners, several deputations of inhabitants resident in different parts of the City, attended for the purpose of pressing the necessity of paving the principal thoroughfares of the City with wood in preference to stone. Among them was one from Leadenhall-street, consisting of thirty of the principal inhabitants of that street; and another of gentlemen residing on the south side of St. Paul's Churchyard, almost as numerous, the memorial of the latter being presented by Mr. Alderman Wilson. After the deputation had retired, the Commissioners decided that the memorials be referred to the paving committee for consideration. It was stated that this committee have now nearly thirty memorials in favour of wood paving before them, and it is expected that Cornhill, Leadenhall-street, and Aldgate, will shortly be paved with wood, although a strong feeling exists that Finsbury-place, the south side of St. Paul's Churchyard, and Paternoster-row, should be paved first.

Anti-Corn-law League.—The usual weekly meeting of the League took place on Wednesday at Covent-Garden Theatre. Mr. Warburton, M.P., presided, and the meeting was addressed by the chairman, the Hon. C. P. Villiers, Mr. Gibbs, a tenant-farmer from Buckinghamshire, and Mr. W. J. Fox.

Gambling-houses.—On Tuesday morning, shortly before one o'clock, a determined attack was made by the police upon a number of gambling-houses at the west end of town, situate in Bury-street, Albemarle-street, St. James's-street, and other neighbourhoods. Upon the several divisions reaching the respective houses that were to be entered, an attack was at once made upon the doors, when admission was soon obtained. The police then rushed up the stairs into the different rooms. In some of the houses the gambling was going on, when, upon the noise of the police being heard, a general attempt was made to escape. The police, however, succeeded in capturing several persons, and getting possession of the tables, cues, &c. The prisoners, many of whom were of a superior station, were brought before the magistrates on Wednesday, and sentenced to various fines or imprisonment.

Hampton-court.—An inquest has been held on the mutilated remains of the child found last week in the sewer of the palace. Mr. Wakley, the coroner, stated his opinion that the child had not come from the palace at all—that it had been thrown into the barrel-drain at or near one of the public privies, and very likely by some person coming from a distance. He thought it necessary to state this, as it was sworn that the private water-closets of the palace had no connexion with the barrel-arch in and near which some portions of the body were found; and it would be likely to free all persons in the palace upon whom suspicion had been cast. The jury returned a verdict of "Wilful murder against some person or persons unknown."

Mortality of the Metropolis.—The following is the number of Deaths registered in the week ending Saturday, April 27.—West Districts, 134; Northern, 149; Central, 178; Eastern, 172; Southern, 247; Total, 880. Weekly average for the last five years, 946.

Provincial News.

Bagshot.—We gave an account in our last of the firing of upwards of 700 acres of the plantations belonging to Prince Albert at Bagshot. It appears that the fire was first discovered between the College, at Sandhurst, and Cæsar's Camp; and while persons were employed, although ineffectually, to subdue the flames, a second fire was discovered, of equal extent, at about a mile distant, between Winchmore-cross and New England. Such was the rapidity with which the flames extended, that before noon these two conflagrations had become united, the wind blowing strong from the north-east, and the flames at one time extended two miles in length, and upwards of a mile in breadth. A considerable number of Sappers and Miners, under the command of Sir George Scovell, Governor of the Military College, immediately proceeded to the spot, and rendered effectual aid in checking the progress of the flames, and preventing their communicating with other valuable property belonging to Prince Albert and the Marquess of Downshire. The quantities of game, especially hares and pheasants, which have been destroyed, are immense. Hundreds of eggs of the latter have been consumed. A third fire broke out in another part of the same plantation on Friday last; but, timely assistance being at hand, it was fortunately subdued, but not before it had entirely destroyed all the firs and young oaks extending over more than five acres. Notwithstanding every effort has been made to discover the incendiaries, not the least traces of the guilty parties have been obtained.

Bristol.—We learn by the *Bristol Mirror* that it was intended last week to haul the Great Britain into the floating harbour, and to moor her there while the tanks upon which she is to be floated through the locks into the river are being constructed. A slight impediment, however, for some time prevented her removal. It appeared that a portion of the timber upon which she rested had, from her great weight, become firmly fixed to her keel, and, from want of sufficient depth of water, she was unable, with this obstacle adhering to her, to clear the sill of the caisson, notwithstanding that her draught is only 12 feet. On Thursday, and again on Friday week, the water in the float was raised about 18 inches; but this was not sufficient to enable the vessel, with her encumbrance, to pass clear. On both occasions she was hauled one-third out, but had to be hauled back again. Various expedients were resorted to, in order to detach the pieces of timber in question, but without success. Mr. J. M. Hyde, mathematical instrument maker, subsequently undertook, by means of his diving apparatus, to descend to the bottom of the dock, for the purpose of ascertaining the exact position and nature of the impediment, and this hazardous work he performed on Friday afternoon in the most intrepid manner. He made his first descent about 20 minutes to 5 o'clock, and remained under water a quarter of an hour. After a short interval he again descended, and succeeded in fastening a rope to a large plank, which was hauled from the ship's bottom to the surface of the water. Mr. Hyde subsequently took with him a chain, which he affixed to the main obstacle to the vessel's egress, and on Monday forenoon he succeeded in detaching from the vessel several pieces of timber, which floated upwards to the surface, and the vessel was liberated. She was then hauled out of dock, and now lies moored in the floating harbour, near the Clifton Gas Works.

Carmarthen.—We extract the following from the *Carmarthen Journal*:—"On Friday last, a very unusual occurrence took place in the river Towy, which caused some consternation in the minds of the superstitious, who happened to be eye-witnesses of it. As some workmen were standing on the banks of the river near the Tin Mills, contiguous to this town, they suddenly observed the surface of the water completely covered with myriads of live insects, which, on closer inspection, they found to be large black flies. They were in a dense mass, covering the entire breadth of the river; and it was calculated that they must have been about a mile in length, as they were full twenty minutes passing the works, before the river got clear of them. It is asserted that the same phenomenon occurred last year, a few weeks before the celebrated Rebecca demonstration took

place at the workhouse, and the superstitious augur that some fearful calamity will occur this year again."

Ely.—One of the most serious fires which ever happened in this county, took place on Wednesday week, at Streatham, near Ely. The destruction of property is enormous; not less than twenty-five houses, &c., have been rased to the ground, including habitations of agriculturists and labourers. The fire originated in a small hovel adjoining a blacksmith's shop. The damage has been estimated at between 15,000*l.* and 20,000*l.*, a great portion of the property being uninsured.—Another incendiary fire took place at Exning, about two miles from Newmarket, on the following night, on a farm, the property of Mr. Stigwood.

Llanelly.—A serious accident occurred on Friday in a colliery near this place. It appears that between 2 and 3 o'clock in the afternoon the engine in the Penbwlchgwyn colliery, about two miles from Llanelly, caught fire. After a short time the engine with a tremendous crash fell into the pit, apparently shutting out every chance of escape for the 24 men and children who were working in the pit. All attempts to put out the flames were vain, and all the woodwork was consumed in the course of an hour, after which the fire died away. The rope, machinery, &c., were also destroyed, and a great portion of the iron work of the latter fell into the pit, at the bottom of which were 18 men, 6 boys, and several horses, being considerably less than the number usually employed. As the current of air to the pit was supposed to have been entirely cut off by the flames, it was feared, and indeed believed by experienced engineers and colliers, that the poor men must have perished. It appears, however, that they preserved themselves by throwing water on the wooden partition which divided the pit; and the people above at last succeeded in rescuing them from their perilous position.

Manchester.—The Theatre Royal in this town was totally destroyed by fire on Tuesday morning. It appears that the building was used on the previous evening, and was closed about the usual time, less fireworks and a smaller number of lights having been used than usual. So rapid was the progress of the flames, that nothing but part of the wardrobe could be saved. It is singular that on the same night the Theatre Royal at Liverpool had a narrow escape from the same cause. An alarm was raised that the house was on fire, and the audience rose and fled to the door. The alarm, however, soon subsided on its being ascertained that some scenery only had ignited, which was extinguished by a few buckets of water.

Newport.—On Saturday evening the Severn, iron steamer, plying between this place and Bristol, was lost in the Usk, by being drifted by the strong tide against Newport bridge. The Severn and the Avon are two new vessels lately put on the station by a new company. They were propelled by the Archimedian screw, and by high-pressure engines, and have only been running about three weeks. It appears that the vessel had all her passengers on board, and was preparing to start for Bristol, when the stern rope was let go, and orders given to reverse the engine. It was then discovered that the screw would not act, and the vessel was at the mercy of the current. She therefore drifted rapidly with the tide, and in a few minutes struck against the sharp angle of the bridge, which stove in the bow; the water began to flow in, and the pumps were set to work, but she rebounded, and again struck broadside against the bridge with such force that it was almost miraculous she did not turn right over. The scene was now heart-rending. There were about 50 passengers on board, and the screaming and cries for help were dreadful. There was a large number of people assembled on the bridge and shores, and assistance was promptly afforded, and all the passengers and luggage were saved, it being an hour and a half from the time of the vessel striking to her going down. Several attempts have been made to get her up, but as yet without avail. On examination it was found that the obstacle was a long piece of chain, which had been firmly twisted round the screw which had thus caused her destruction. How the chain came there is a complete mystery, as all her mooring chains have since been examined, and are safe, and the captain and crew say that they had no such chain on deck. The vessel has since rolled over with every tide, and has a rent in her side from the deck to her keel large enough for men to walk in and out, so that it is very doubtful whether she will not go entirely to pieces.

Taunton.—Public feeling was so much excited by the trials of the two Sealeys for the late murders in Somerset, that a subscription has been raised to send Mary and Faith Sealey out of the country, and they have proceeded to one of our sea-ports, from whence they will take their departure for Australia.

Windsor.—The parties in the late match from London to Windsor, after the performance of which one of the horses died of exhaustion, appeared last week, at the instance of Mr. Thomas, Secretary to the Society for the Prevention of Cruelty to Animals, at the Town-hall, Windsor. The charge of excessive cruelty was fully substantiated against the driver and owner of the horse which subsequently died, a Mr. William Moseley, who was convicted in the full penalty—40*s.* and costs. A Mr. Henry Bond, a medical student, the rider of the other horse, was then proceeded against, but as the animal he rode was described as having been in no degree distressed, the charge was dismissed. Mr. Thomas, in answer to a question from one of the bystanders, replied, that the law, however efficient against these criminals, would not reach the parties to the recent steeple-chase, at which three fine horses had perished.

York.—George Lowther, who was sentenced to be executed for the murder of the Marquis of Normanby's gamekeeper, is to be transported for life.

Railways.—The following are the returns for the past week:—Birmingham and Derby, 1376*l.*; Birmingham and Gloucester, 2086*l.*; Eastern Counties, 4420*l.*; Edinburgh and Glasgow, 2363*l.*; Great Western, 14,974*l.*; Grand Junction, 7647*l.*; Glasgow, Paisley, and Ayr, 1239*l.*; Great North of England, 1353*l.*; London and Birmingham, 17,443*l.*; South-Western, 6139*l.*; Blackwall, 1062*l.*; Greenwich, 933*l.*; Brighton, 3538*l.*; Croydon, 307*l.*; Liverpool and Manchester, 4346*l.*; Manchester, Leeds, and Hull, associated, 5920*l.*; Midland Counties, 2911*l.*; Manchester and Birmingham, 3254*l.*; North Midland, 4336*l.*; Newcastle and Carlisle, 1319*l.*; South-Eastern and Dover, 3691*l.*; Sheffield and Manchester, 536*l.*; York and North Midland, 1524*l.*—The select committee of the House of Commons appointed to inquire into the merits of the two proposed competing lines of railway from Manchester to Ashton and Staleybridge—the one projected by the Manchester and Leeds Company, and the other by the Sheffield and Manchester Company—have concluded their labours, and have come to the decision of allowing both lines to be constructed. These two lines are the first, and at present the only competing lines that have been sanctioned by a committee of the House of Commons.—The Report of the Railway Department of the Board of Trade has just been issued. It reports a progressive increase in the safety of travelling upon railways during the past year, only one serious accident of a public nature having taken place—that upon the North Midland railway, by which one passenger lost his life; the number of passengers travelling on the 66 railways during the past year not being less than 24,000,000, conveyed on an average about 15 miles each. This, in the opinion of the reporters, shows the high degree of security attained by railway travelling, and demonstrates in a most forcible manner the advantages which have resulted from the progress of scientific improvement in point of safety as well as of speed. It is satisfactory, they report, to find that the number of accidents have been so small, during the period considerable retrenchments having been effected in the expenditure of most of the Companies, and there has been a tendency to economise, by every possible means forced upon them by a decline of their traffic during the late period of commercial depression, and which, if not tempered by proper discretion on the part of the directors, must, in many cases, have been productive of danger. It was also satisfactory to find that the number of accidents attributable to the misconduct or inexperience of engineers and servants of the Railway Companies, or to defective arrangements on the part of the Companies, was on the decrease. During the year ten new lines of railways had been examined by the Inspector-General of Railways. The report contains much voluminous information upon the subject of railway statistics.—On Friday General Pasley made his inspection of the Liverpool Junction line just completed through Salford, and was so far satisfied with the various works, that he hinted to the representatives of the Liverpool and Manchester Company that they might open the line without waiting for an official order. Accordingly the line was publicly opened on Saturday morning, since which time the whole of the passenger trains have run from the Victoria station at Hunt's Bank. No stoppage is made to take up passengers at the junction with the old line at Ordsall-lane, and the offices in Liverpool-road, so far as the passenger traffic is concerned are entirely closed. The old station, however, is still the station for the Manchester goods traffic. The new offices, waiting-rooms, &c., of the Liverpool and Manchester Company, at the Victoria station, adjoin those of the Manchester and Leeds Company, and are very commodious. There is now, therefore, one continuous line of railway communication across the country from Hull to Liverpool, and the Irish Channel is thus brought into close neighbourhood with the German Ocean.—It is said that amongst the policemen on the Great Western Railway are eight members of the Royal College of Surgeons, and three solicitors.

IRELAND.

THE STATE TRIALS.—On Thursday Mr. Fitzgibbon addressed the Court on behalf of Dr. Gray, and, contrary to expectation, compressed his arguments into one day's speech. Mr. M'Donagh on Friday followed on behalf of Mr. Barrett, and, considering that it was needless to repeat the arguments which had been already urged in every shape which legal ingenuity should suggest, the learned gentleman confined his address to about three hours. The Attorney-General then rose to reply to the four preceding counsel for the traversers. He began by adverting to the misnomer of Mr. Rigby the juror. Rigby, he said, was a favourite juror with the traversers before he was empanelled. They insisted on retaining him, though he struggled hard to escape from them. He (the Attorney-General) had only insisted on his being sworn, as he was summoned, but had not interfered to remove him from the panel. Had he done so, the obloquy he would have been obnoxious to from the traversers' press would have been incalculable. But having got Rigby and kept him, it was somewhat shameless for the traversers now to insist that the trial was a nullity, because they had succeeded in retaining him. But bolder still was the objection that none of the offences charged had been proved to have occurred in the city of Dublin, when that had appeared a hundred times unnecessarily, and at every stage in the trial. After the Attorney-General had been speaking some hours, the Court adjourned. On Saturday the Attorney-General resumed his address. He submitted that there was abundant evidence to show that the newspapers were used for the purpose of forwarding the objects of the conspiracy. There was no ground whatever to disturb the verdict; if Mr. O'Connell had come forward with an affidavit stating that he did not make the speech attributed to him at Mullingar, the point might have some weight, and he (the Attorney-General) would not oppose the Court in a desire to do an act of justice; but he was to assume that speech was made. It was said that publication was not evidence of circulation. He cited several cases to show that the production of a paper from the Stamp-office was sufficient proof of circulation. If it were not, could it be said that a second paper was sufficient? Or how many papers should they produce to prove circulation? That was a point not made at the trial; had it been, a question to Mr. Vernon, of the Stamp-office, would have settled it. He could have been asked what the circulation was, and he would have answered by the newspaper stamp returns. He did not know any other matter connected with the charge with which it was worth while to occupy their lordship's time, and the only remaining matters were the allegations on the part of Dr. Gray and Mr. Duffy, that the verdict was against the weight of evidence. The learned Attorney-General then briefly summed up the evidence that had special reference to these traversers, and which, he maintained, fully overcame that objection. He did not wish to state what he thought of the notice of motion served by the traversers, further than that it was most improper, that it was a libel on the court and the administration of justice, and ought not to have ever been prepared or drawn up.—Mr. Ford said that he, in the discharge of his duty, prepared that notice, and he hoped that attorneys would always be found to fearlessly discharge their duty, notwithstanding the remarks of those prosecuting for the Crown.—The Attorney-General said that he would not be provoked to speak of that document as it merited, but there was no doubt that its publication through the newspapers was calculated to prejudice the public mind against the Court of Queen's Bench; but he knew it would not be terrified from the firm discharge of its duty. He then read Lord Mansfield's opinion with regard to attacks of the public press, with which he concluded his address.—Mr. Whiteside said that the Attorney-General had referred in the course of his speech to twelve new cases; and it being arranged that no cases should be introduced besides those referred to by the Solicitor-General, counsel for the traversers were entitled to a reply.—The Attorney-General: then I should have a right to reply to you, and the case would never end.—Mr. Justice Burton: The court will look into the nature of the new cases cited by the Attorney-General, and if they think that there is anything in them that requires observation on the part of the traversers, counsel will be allowed to reply.—On Monday, the Court was greatly crowded in the expectation that their lordships would have given judgment, but the business transacted was of no public importance. On Tuesday, the court was still more crowded. The curiosity of the public was not diminished by the knowledge of the fact, which soon transpired, that the judges had been in chamber before 10 in the morning, and as the appearance of the junior Judges was delayed much beyond the usual period, it began to be suspected that there was some truth in the rumour that the Judges were equally divided as to the motion for a new trial. Their Lordships at length took their seats, and the Chief Justice said: Mr. Attorney-General, "I am sorry to inform you that the Court find they cannot give judgment in the case until next term." The crowd immediately dispersed, and in a short time there were no signs of any unusual excitement. It is rumoured that the Judges of the Queen's Bench intend, before delivering judgment, to consult with their brethren in the other Courts. The next term commences on the 22d of this month.

Dublin.—An adjourned meeting of the Repeal Association was held on Friday in the Conciliation-hall, which was thinly attended. Mr. O'Connell (a relation of the "Liberator") in the chair. On the motion of Mr. O'Connell it was resolved that Mr. Ray should be instructed to write to all persons in America who had hitherto sent them money, to inform them that no one whatever was authorised to correspond with them, or direct them in the disposal of their funds, except the said Mr. Ray. This was necessary in consequence of some persons having written to America from Dublin, as if authorised agents of the Association. Mr. O'Connell stated that he had not been able to prepare the document he had promised to submit to the Association that day, with the view of regulating the conduct of the Irish people after the prosecutions. He therefore moved that it be referred to the committee, to prepare an address on the subject. He denied the truth of a statement in the *Univers*, copied from the *Standard*, to the effect that he was in a state of great dejection. He never felt so little dejected in his life, for he knew the worst and was well prepared for it. Others might be faint and downhearted, but he saw nothing to dispirit him; for he knew the impression which the prosecutions had made upon the Irish mind, and was convinced that the gallant people of Ireland would never rest till they saw their native Parliament in College-green. He reiterated his command to peace and order—detailed the means by which the Union was carried—denounced Lord Eliot's Franchise Bill as a truculent insult—and solemnly declared that Ireland could never be prosperous and happy until she was legislating for herself. The Rent for the week was announced to be 248*l.* 1*s.* 6*d.*—A company is forming to run a railway from Dublin to Sallins (which is within

two miles of Naas), along the banks of the canal. The Canal Company join in the speculation. The power to be used is atmospheric. There is little doubt that the speculation would pay; but there is some doubt that Parliament will favour the project, as the line would be decidedly a competing one. All the shares in the Drogheda and Portadown speculation are taken.

Miscellaneous.

The New Governor-General of India.—At the present moment some few particulars of the life of the newly-appointed successor of Lord Ellenborough in the Government of India will probably be acceptable to our readers. The Right Hon. Sir Henry Hardinge is the son of the late Rev. Henry Hardinge, rector of Stanhope, Durham, and was born in 1785. At an early age he evinced a strong disposition for a military life, which his parents thought fit to encourage, and he was therefore educated with much care for the profession in which he so soon and so greatly distinguished himself. His services in Spain and Portugal are repeatedly the subject of warm commendation in the despatches of his illustrious commander; and at that momentous crisis in European affairs, when the Prince of Orange proposed levying a large body of troops, it was to Captain Hardinge that Lord Wellington recommended his Royal Highness to apply for counsel and assistance. Sir Henry was present in person at the following actions or battles, in each of which he more or less distinguished himself, receiving several severe wounds:—Busaco, Albuera, Badajoz, Salamanca, Vittoria, the Pyrenees, Nivelle, Nive, and Orthes; he was also at Waterloo, and at the engagement at Ligny he lost his left arm, for which he receives a pension of 300*l*. For his services in the Peninsula he was rewarded with a cross and five clasps, and from 1809 to 1813 he was Deputy-Quartermaster-General of the Portuguese army. He has likewise received several foreign Orders. In 1827 he married the sixth daughter of the first Marquis of Londonderry, relict of John James, Esq., and mother of the present Sir W. James, Bart., M.P. In 1823 he was appointed Clerk of the Ordnance, which office he continued to fill until 1828, when he was made Secretary-at-War. In 1830 he was appointed Secretary for Ireland, which he resigned at the dissolution of the Duke of Wellington's Administration, and in 1834, during the brief Administration of Sir Robert Peel, he was again selected to fill that office. On the accession of the Conservatives to power, in 1841, he was re-appointed Secretary-at-War.

Wool-Mosaic Cloth.—A new invention has recently been introduced into this country from Berlin, in which the brilliancy and variety of colours of Berlin wool are blended together in devices of surpassing elegance and richness. The manufacture has all the appearance of painted velvet, with the texture and lasting qualities of a woven fabric. In the process of manufacture the figures, with their various hues, are woven in a thick pile several inches long, and the fabric is then divided into laminæ and fixed on to flexible India-rubber ground-work, each slice of the pile producing a separate picture in wool. Some of the groups of flowers produced by this process are exquisitely beautiful, and are admirably adapted for the decoration of palatial drawing rooms. The attempts to copy paintings and to take likenesses are comparative failures, but for ornamental designs the mosaic cloth is almost unrivalled in beauty.

Law.

COURT OF QUEEN'S BENCH.—*The Queen* v. *Humfrey.*—In this case the Solicitor-General on the part of the Duke of Marlborough moved for a criminal information against Mr. Humfrey, barrister, for alleged libels uttered by him on the hustings at the late election for Woodstock. The alleged libels were stated at great length, and consisted of several distinct charges against the Duke for acts of cruelty and oppression towards his tenants, driving them from their homes, inflicting fines upon persons who had walked on the grass at Woodstock, abusing his position as a magistrate, to punish and imprison a person who had taken up a rabbit on the estate after it had been killed by a weazel, refusing to pay for the coffin of the late Duke, and other matters. After the address of Counsel the Judges deliberated for some time. Lord Denman then said—This is an application to the Court for the exercise of its extraordinary jurisdiction in issuing a criminal information in respect to words spoken of the Duke of Marlborough at the last election for the borough of Woodstock. Those words certainly convey most grievious imputations—they are words importing most grievous charges against that noble person, and we can by no means wonder that he takes the earliest opportunity that any course of proceeding affords him, of coming into Court and denying upon his oath the truth of those charges. This is one of the benefits conferred on the subjects of this realm, by the opportunities we have of granting, and refusing, and considering of criminal informations. The question is, whether these words are of such a nature that we ought to direct the information to issue: Now, with regard to the three last cases that I think the Solicitor-General stated before us, it is perfectly clear upon all the authorities that those words being merely spoken, are not the proper subjects of a criminal information, unless they could be converted by circumstances into some other misdemeanor, that is, the misdemeanor of endeavouring to provoke a breach of the peace, either by means of a retort, of immediate personal violence, or by means of a challenge to be communicated between the parties. The words upon which we have entertained some doubt are those with reference to the charge that the Duke of Marlborough, on some former occasion, corruptly and partially exercised the office of a magistrate, in resentment towards a particular individual. The denial of that charge is complete; but we do not find that there is any instance of this Court interfering for the purpose of granting a criminal information in such a case. There are many cases upon which the Court has said distinctly, that unless words be spoken of a magistrate actually at the time of his performing his duty, the Court will not interfere; and I take it that they do interfere, upon the principle that an offence is then committed by the direct obstruction of the administration of justice, that is an offence that may possibly be visited by the magistrate himself as a contempt, but which it is far more expedient in my opinion that this Court should exercise by its interposition. There is no case, however, which directly says, that where a charge is distinctly made against a magistrate of magisterial corruption and improper conduct that this Court will not interfere. And it is not improper to refer to the work of Mr. Starkie, published in the year 1830, where, after adverting to the cases, he makes this observation:—"The cases might fall under a very different consideration if the magistrate were to be charged with some specific act of oppression or corruption in his judicial capacity." Now, such specific act of oppression and corruption is charged here. But that doubt is no more than a doubt expressed by Mr. Starkie, and it is certainly founded upon no decision or authority of this Court. I own that I expected the cases which stopped short of interference would have been commented on by the Solicitor-General, and that we should have been referred to some proceeding of this Court, in which that had been laid down by authority. The only reason why that course has not been taken is, that no such opinion and no such dictum has ever fallen from the Court, and it is perfectly clear that we could not grant this rule without creating a precedent. It appears to me that that is a thing in itself highly inexpedient, and that when the course has been well understood for many years, we ought not by any means to set a new example without being perfectly clear that the law of the land will justify us in so doing. Independent of the grounds to which I have adverted of the absence of authorities upon this subject, there is one principle which seems to pervade the opinion of the Court in discussing all these matters, and that is the unwillingness to make *mere words*, upon any occasion, amount to a crime; there is so much difficulty about the proof, there are so many opportunities of various explanations being given of words that, perhaps, heard by themselves, may convey a gross imputation; but, taken altogether, may be justified or greatly palliated, that the Court is extremely unwilling to act upon anything that passes that must depend upon oral evidence only. For that reason, and for the others to which I have alluded, it seems to me that we ought not to interfere in this case, because we cannot possibly do so without setting an example which is in itself much to be deprecated, and which in its consequences obviously would lead to a length of inquiry in the most inconvenient way, and the least satisfactory to truth and justice which can possibly be conceived. It is upon this ground, and upon this ground *only*, that I feel it, for one, not proper to grant this rule.—Mr. Justice Patteson—I entirely agree in what has fallen from my Lord, and have nothing to add.—The other Judges concurred, and the rule was refused.

COURT OF CHANCERY.—*The Dean and Chapter of Ely* v. *Bliss.*—This appeal from the Master of the Rolls was argued some time ago. The plaintiffs filed their bill for tithes of corn and grain, and tithes of agistment, and the defendants pleaded the late statute of the 3d and 4th of William IV., as a bar to the claim, contending that it repeals the act commonly known as Lord Tenterden's, and that the title to the tithe was gone in consequence of no claim for twenty years. The Master of the Rolls decided in favour of the defendants, holding the statute of William to be a bar to the claim. It was contended for the appellants, that this statute applied to a claim for an estate in tithes, not to a claim made by a tithe owner against an occupier, and that length of non-payment gave no exemption. The tithes claimed are those of Laken Heath Fen (part of the Bedford Level), of which the plaintiffs held the rectory; but the question, although of great importance to the parties, is also of extensive public interest, in consequence of its affecting a great number of other claims of a similar description. The Lord Chancellor now gave judgment. The question in the appeal was of the greatest importance, and turned almost, if not entirely, on the effect of the 3d and 4th Will. IV. c. 27. That question was, whether the limitation in the statute, applied to tithes, had a reference to suits between persons claiming adversely a right to property in tithes, or to suits between tithe owners and occupiers of land which may be subject to tithes. It was argued that, according to the proper construction of the act, its operation must be confined to the first class of cases. The difficulty was in the construction of the second and third sections of the act. By the second it was enacted that no suit or action to recover land, subject to tithe, shall be brought after the expiration of twenty years, from the time when the right accrued. The words of the act were to recover land, and the argument was that land included tithe. It was quite clear that the act applied to the first class of cases, those claiming adversely to others a right to land paying tithes, and the question then was, did it apply to the others? In the first place, it was quite clear that there could be no such thing as an action to recover tithes. If, therefore, according to the natural construction there could be no such application of the act, was there any good reason for supposing it extended further? The act of the 2d and 3d Edward VI gave no right of action for tithes, but merely inflicted a penalty of three times the value for not setting out the tithe. Now why, unless the express language of the act forced them to a construction respecting claims for tithes, were they to be compelled under such circumstances to include them? Another objection was, that the act of Edward applied merely to prædial tithes of corn and grain, and not to agistment tithes of lamb and wool. If the legislature intended to make a limitation with respect to claims for tithe, was it not an extraordinary thing that it should extend its limitation to any one description of tithe and take no notice of the others? That showed the impropriety of attempting to put any forced construction on its language. It was said, in answer to this, that although there could be no such thing as an action for tithes, yet that a liberal construction ought to be given to the words of the act, and that although the suit might not be entertained for tithes, yet it might be for the value of the tithes. In the act, however, the words expressly applied to proceedings for the recovery of tithes, and it certainly seemed that it would be too great an extension to include in that the subject of a penal enactment, for the act of Edward merely inflicted a penalty for not setting out tithes. Another difficulty arose out of the wording of the third section, which declared that the right was to accrue from the last time of the receipt of profits. His lordship thought, however, that these words applied to claimants of an estate in tithes between two adverse litigants. The third difficulty arose from a reference to the act of Lord Tenterden, passed in the session immediately preceding that in which the act of William was introduced. That act was intended to shorten the period of proof, declaring thirty years to be a bar, and it certainly did not seem reasonable or natural that the legislature would, in the very next session, without any obvious reason, cut down that term to twenty years. These were points deserving of the most serious consideration, and the more so, as they did not appear, from what his lordship could collect, to have been brought under the attention of the Master of the Rolls, so fully as they ought to have been. His lordship could not help thinking that if he pronounced a decision in the cause adverse to that of the Master of the Rolls, the consequence would be that the matter must be carried further, with a great expense to the parties. Considering, therefore, that the question was one of mere law, and that it was one which must have extensive effects; considering, also, that the commissioners of tithe commutation had already taken the narrower view of the construction of the act, and that a case on the subject was about to be brought for the decision of the Court of Queen's Bench, his lordship thought that the better course, instead of pronouncing a decided opinion on the point, would be to direct the case to be brought before the judges of the Court of Exchequer, when it would probably be argued in the course of next term, and the whole matter decided before the long vacation. His lordship felt it right, however, to say, at this period of the case, that he thought, under any circumstances, the plea was a bad one, because it attempted to cover too much. The act was for the recovery of tithes prædial, not tithes of agistment, and they could not therefore be included in the limitation. The plea, therefore, was defective, but it was unnecessary to say more at the present stage of the cause. The learned gentleman who drew it up had plainly felt great difficulty in bringing it within the statute.

CENTRAL CRIMINAL COURT.—*The Marylebone Murder.*—*William Crouch*, aged 28, groom, was placed at the bar, charged with the wilful murder of his wife, Frances Elizabeth Crouch. The particulars of this case have been already given in this paper, and it will be unnecessary to repeat them as given in the evidence of the numerous witnesses. It is sufficient to state that the crime was fully proved against the prisoner, and that the defence set up was a plea of insanity. Mr. Baron Alderson [illegible] the evidence, premising, that when a plea of insani[illegible] defence of a crime, it was necessary to show that [illegible] produced by a form of disease contained involunt[illegible] afflicted person, and not produced by the voluntary act [illegible] individual. If a person by drinking deprived himself of [illegible] and whilst in that state committed a crime, he could n[illegible] insanity of drunkenness in justification, because he [illegible] deprived himself of the power over his own a[illegible] manner, if a man were in such a diseased state, or [illegible] from whatever cause, that a much smaller quantity [illegible] produce insanity in him, than would be require[illegible] ordinarily in other men, that man should abstain [illegible] quantity. For, if he were aware that by taking ev[illegible] quantity of alcohol, he would deprive himself of his senses, he could not plead insanity so produced in justification of any act of violence which he might have committed under the influence of the excitement. In the present case, therefore, the jury should consider whether it had been proved that the prisoner committed the act with which he was charged, whilst under the influence of excitement produced by disease of his brain, and not voluntarily from other causes. Although there could be no doubt about the fact of the deceased having been killed by the prisoner, yet he thought it necessary, under all the circumstances, to go through the entire of the evidence, to which he would beg the attentive consideration of the jury. His lordship then read over the entire evidence, commenting upon such parts as tended to show an aberration of the prisoner's mind, and observing that there was no proof of his having drank anything more than a pint of beer on the day of the murder. He also remarked that it was proved by the evidence for the prosecution that the prisoner was in a state of stupor both before and immediately after the commission of the deed. After a short consultation by the jury in the box, Baron Alderson suggested that they had better retire. The jury accordingly retired, and at 9 p.m. they announced that there was no chance of their agreeing upon their verdict that night. An officer was then sworn to take charge of the jury, and keep them without meat, drink, or fire (candle-light excepted), until they had agreed. On Thursday morning the foreman said they were not yet agreed, and the jury were anxious that the portion of the evidence which related to the question of the sanity of the prisoner should be again read over to them. Mr. Justice Coltman said that the Learned Judge who tried the case was engaged elsewhere, and he had taken his notes with him. A messenger should, however, be sent to request the Learned Judge to come down to the Court. The Foreman then said that the jury had been four-and-twenty hours without any refreshment, and begged they might be allowed to have some food, as they were nearly exhausted. Mr. Justice Coltman said he had no power to order them any refreshment. In about an hour a message was sent from the jury, complaining that they were in such a state of exhaustion that they must sink if they were not allowed to have some refreshment. The Judge upon this, sent Dr. M'Murdo, the surgeon of Newgate, to the jury-room, and on his return, he stated that the jury were so exhausted, that he did not think they could exercise their mental faculties without refreshment. He did not, however, think their lives were in danger, though their health certainly was. The Judge said the Court could not act unless the lives of the jurors were endangered. Soon after this Baron Alderson arrived, and read over to the jury that portion of the evidence which more immediately referred to the prisoner's state of mind. The jury then retired, and shortly afterwards returned a verdict of Guilty. Baron Alderson then passed sentence of death in the usual manner.

SPORTING.

NEWMARKET SECOND SPRING MEETING.

Jones, of the Grenadier Guards, aged 30—6th inst., at her seat in Devonshire, the LADY LECALE, relict of the late Lord Lecale, aged 66.

DESTRUCTIVE ANIMALCULÆ. — As Spring approaches, the larvæ of DESTRUCTIVE INSECTS are propagated in infinite multitudes, and impregnate with millions of insects the very air we breathe. J. READ begs to inform every person interested in the practice of Horticulture, that he has made considerable improvements in his ENGINES AND MACHINES for the purpose of destroying those Animalculæ which make such deadly havoc on all choice Fruit-trees and Plants at this season of the year. The above are fitted with tubes that will bear any degree of pressure required, and are water, air, and steam proof. From 31 years' practice in Horticulture, and 21 years in manufacturing and improving, Engines, J. R. can warrant them the best adapted for the above purposes of any hitherto made; the valves being solid spherical metal are never liable to be out of repair, even in the hottest climates.

Manufactured only by the Patentee, 35, Regent Circus, Piccadilly, where they may be seen and proved.

N.B.—None are genuine except stamped with the words, "READ'S Patent."

PIANO-FORTES.—LUFF and Co.'s Boudoir or Piccolo only £25, including use of case, is the best and cheapest Piano-forte for the country Cottage, being only 3 feet 6 inches high, with curtain front and back; it is powerful in tone, is warranted to keep well in tune, and prepared for extreme climates. L. and Co.'s Patent Cottage Cabinet and Semi-Grand is equally cheap.—LUFF and Co., Manufacturers, 103, Great Russell-street, Bloomsbury.

ROWLAND'S ODONTO, OR PEARL DENTIFRICE, patronised by "Her MAJESTY," H.R.H. Prince ALBERT, the Royal Family, and the several Courts of Europe. A FRAGRANT WHITE POWDER, prepared from Oriental Herbs of inestimable virtue, for strengthening, preserving, and cleansing the teeth. It eradicates the factitious formation of tartar, and by the removal of that extraneous substance lends a salutary growth and freshness to the gums. It removes from the surface of the teeth the spots of incipient decay, polishes and preserves the enamel, substituting for discolour and the aspect of impurity, the most pure and pear-like whiteness; while, from its salubrious and disinfecting qualities, it gives sweetness and perfume to the breath, bestowing at once cleanliness, and the appearance and reality of health. Price 2s. 9d. per box, duty included.

CAUTION.—To protect the public from fraud, the Hon. Commissioners of Her Majesty's Stamps have authorised the Proprietors' Signature to be engraved on the Government Stamp thus,—A. ROWLAND and SON, 20, Hatton Garden, which is affixed to each Box. Ask for ROWLAND'S ODONTO. Sold by them, and by Perfumers and Chemists.

*** All others are SPURIOUS IMITATIONS.

TWENTY YEARS' LOSS of HAIR, and WONDERFUL RESTORATION. Church-street, Whitby, Oct. 19, 1844.——Gentlemen,—Of the last supply of OLDRIDGE'S BALM OF COLUMBIA every bottle was sold immediately on receipt, and I have many more bespoke, only waiting for a further supply, which I hope you will send without the least delay. Orders have poured in more than ever since the powerful effects of the Balm have been so decisively demonstrated in the cases of several credible and respectable inhabitants of the town. One instance, among others which have attracted particular attention, is the case of a gentleman who had had little or no hair for 20 years; he had tried numerous preparations in vain, and ultimately had his head shaved, and wore a wig. At my recommendation he tried the Balm; and after using it according to the directions for a short time, the young hair appeared, and he has now as fine a head of hair as any person in Whitby. Yours, &c., JOHN KILVINTON.—To Messrs. Kennaby, Brothers, 19, Westmoreland-buildings, Aldersgate-street, London.

OLDRIDGE'S BALM prevents the hair turning gray, produces a beautiful curl, frees it from scurf, and stops it from falling off; a few Bottles generally restore it again. Price 3s. 6d., 6s., and 11s. per bottle. *No other prices are genuine.* Ask for OLDRIDGE'S, BALM of COLUMBIA, 1, Wellington-street, Strand.

HORIZONTAL WATCHES, very flat.—A. B. SAVORY and SONS, Watchmakers, 9, Cornhill, London, opposite the Bank. Price, in silver cases, three and a half guineas each; or in gold cases, six guineas each. These Watches are accurate and durable, the horizontal escapement being peculiarly suited to combine those important requisites. They are jewelled in four holes, and continue going whilst being wound. A twelvemonth's warranty given with each.

NECESSARY PRECAUTION.—CONSUMERS of BRANDY are respectfully informed that J. T. BETTS, jun. and Co. will not be responsible for any bottled Brandy that is not protected against fraudulent substitution, by the Patent Metallic Capsules, embossed with the words, "Betts's Patent Brandy, 7, Smithfield Bars." Sold by the most respectable Wine and Spirit Merchants, in Town and Country, at 3s. 6d. per bottle, the bottle included.

BERDOE'S SUPERIOR LIGHT WATERPROOF FROCKS for the present season.—An extensive variety of the above, in NEW and greatly improved materials (in lieu of the unsightly rubbish made by Slopsellers), now ready; guaranteed to exclude any rain whatever, and confidently recommended to those who regard a respectable appearance, or wish to avoid disappointment and vexation. First-rate Clothing of every description upon the lowest terms possible, consistent with true economy and ultimate satisfaction.—W. BERDOE, Tailor, Waterproofer, &c., 69, Cornhill (North side).

BEE-HIVES.—GEORGE NEIGHBOUR & SON beg to inform their Apiarian friends that they have prepared for the season a large supply of "Nutt's Patent Bee-hives" for the sale of which they are the only authorised agents, in which are embodied all the recent improvements. Their selection now comprehends most varieties in general use at the present time, including the "Single Box Hive," the "Ladies' Observatory Hive," the "Improved Cottage Hive," with glasses, &c., from either of which the produce may be taken at any time of the gathering season, without destroying the Bees.

G. N. & SON have also Glass Hives, and other articles connected with Bee management, a catalogue of which, with drawings, may be obtained. Letters of inquiry must have postage stamps inclosed.—Apiarian Depot and Honey Warehouse, 127, High Holborn, London.

NUTT ON BEES, Fifth Edition, now Published.

TO BEE-KEEPERS.

A. PETTIGREW, Wrotham Park, Barnet, wishes to inform Bee-keepers, whose object is profit, that he will privately give them a hint on Bee Management, worth 10*l.*, for 10*s.* each. The hint is of prime importance to all Bee-masters; and if A. P. is induced by the number of Subscribers to communicate it within 14 days, it will be to their own advantage.

N.B.—If any Subscriber say that the hint is too dear, or that it will not enable him to make 5*l.* more of his Bees this year than he could do without it, A. P. will return his money.—All letters post paid. A. P. does not pledge himself to give the hint to less than 100 Subscribers.

BEE-HIVE.

WILLIAM SAVAGE, of Swaffham, Norfolk, solicits the attention of the public (but more particularly of Amateurs and practical Apiarians) to his newly-invented BEE-HIVE, which he can most confidently recommend to their notice as the result of 40 years' observation and experience, and which may be denominated the Remunerator and Preserver Hive, being better calculated to prevent clustering upon and underneath the Hive in the Honey-season, and as well for a more safe and easy method of taking the superfluous store without destroying a single Bee or impoverishing the stock; and is also well calculated for a receptacle or storehouse for any quantity of honey the season and situation may afford, and which can be taken at any time required.

DRESS AND FROCK COATS.

DRESS COATS, Superfine Cloth, 27*s.*; extra quality, 35*s.* and 40*s.*; Imperial Saxony, 50*s.*; Frock Coats, Silk Facings, 30*s.* to 40*s.*, extra quality, Silk Velvet Collar, and Silk facings, 48*s.*; Saxony ditto, 55*s.*; Children's Silk Tunic and Hussar Suits, 30*s.*; Waistcoats, new patterns, 5*s.* 6*d.* to 10*s.* 6*d.*; Trousers, 6*s.* 6*d.* to 10*s.* 6*d.*; excellent Doeskin, 12*s.* to 16*s.*; Summer Coats, 6*s.* 6*d.* to 10*s.* 6*d.*; Chesterfield Over Coats, with Silk Collars and Cuffs, 15*s.* to 21*s.* The much approved new style, 21*s.* A suit of Black Cloth, 2*l.* 5*s.*; extra quality, 3*l.* 3*s.*; Imperial Saxony Suit, warranted to retain its colour, 4*l.* 4*s.*, at FISHER and Co.'s, Tailors, 31, King William Street, City, 10 doors from London Bridge.

In preparation:

PORTFOLIO OF PICTURES, Ancient and Modern, Coloured and Plain, for Copies, 7*s.* 6*d.*

BOX OF TERRA COTTA BRICKS, Geometrically made, 10*s.* 6*d.* and upwards.

Published by JOSEPH CUNDALL, 12, Old Bond-street, London.

WANTED, in a Nursery 120 miles from London, where New Holland Plants, Ericas, &c. are principally cultivated, a steady, active Man, of good character, as PROPAGATOR. It will be useless for any party to apply who is not thoroughly competent in all its branches.—Address letters to A. B., 45, King William-street, London-bridge, London, stating terms, and reference as to character and ability.

WANT PLACES.—All Letters to be post-paid.

AS GARDENER.—A married Man, aged 30, who has a thorough knowledge of his business, and can take charge of Meadow-land and Cattle. His Wife to look after the Poultry if required. Can be strongly recommended by the gentleman he is about to leave, and with whom he has lived three years.—Direct to W. P., Post-office, Hampton-wick, Middlesex.

AS GARDENER.—A single Man, aged 34, who well understands his business in all its branches; would prefer a situation where one or more are kept, but a single handed situation would be accepted. Can have a six years' good character.—Direct to A. B., Mr. ROLLISSON, Nurseryman, Tooting, Surrey.

AS GARDENER, and to look after a Horse and Chaise, or Cows.—A middle-aged Man, who can make himself generally useful; he has lived with a clergyman nearly seven years.—Direct to W. T., 2, Greenland Grove, Cromer-st.

AS GARDENER.—A married Man, 32 years of age, who understands the management of the Kitchen and Flower Garden, Forcing, &c. No objection to take charge of farming land, if required. No single-handed place accepted.—Direct to Y. Z., 8, Arthur-street, Trevor-square, Knightsbridge.

AS GARDENER.—Wanted, by a Married Man, without any Encumbrance, a Situation in a Gentleman's Family. He understands the management of Hothouse, Greenhouse, and Frames; can have an excellent Character from his last Situation. His wife would be glad to engage herself in any domestic work, if required.—Direct W. W., Stone's Coffee House, 50, Great Windmill-street, Haymarket.

AS GARDENER.—A single Man, aged 39, who has lived 10 years in his last situation, where he had an extensive practice in the cultivation of the Pine, Vine, Peach, and Forcing generally, who left in consequence of the decease of his employer, and breaking up of the establishment. Can have the most undeniable reference as to character and abilities.—Direct to T. M., at Mr. CUTHILL'S, Florist, Denmark-hill, Camberwell, London.

AS BAILIFF.—A middle-aged married Man, without children, who has a practical knowledge of the Yorkshire system of Farming, is desirous of meeting with an engagement to Superintend or take the Management of a Farm. He has had many years' experience in the management of arable, meadow, and pasture-land, and the rearing and feeding of stock. Unexceptionable references as to character and ability will be given.—Direct to E. N., 64, Frith-street, Soho, London.

AS HOUSE or LAND-STEWARD.—A middle-aged Man, who has served in both situations. His character will bear the most strict inquiry, and reasonable security can be given. Active employment is more an object than wages, until the Advertiser's merit is known.—Direct to E. M. MAXWELL, Post-office, Chiswick.

TO MILLERS.

AS SUPERINTENDENT and ASSISTANT in a MILL.—A young Man of considerable experience, who is a good accountant. Can give unexceptionable reference as to character and ability, and good security if required.—Direct to Mr. B. JENKINS, Watchet, Somerset.

AS SECOND GARDENER—Or Gardener in a single-handed place; can Brew, if required, and has no objection to look after a horse and chaise, a respectable young Man, with unexceptionable character from his last place.—Direct J. B., 7, Gloucester-grove, East, Old Brompton.

THE GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE.

A Stamped Newspaper of Rural Economy and General News.—The Horticultural Part Edited by Professor Lindley.

ROYAL BOTANIC SOCIETY, REGENT'S PARK.

EXHIBITIONS of PLANTS, FLOWERS, and MICROSCOPES in the GARDENS of this SOCIETY, for 1844.

Tuesday, June 4.

Tuesday, July 2.

Fellows, Members, and Bearers of Ivory Tickets, will be admitted upon entering their names in the Gate Book. Visitors may obtain Tickets at 5*s*. each, except on the days of the Exhibitions, when they will be 7*s*. 6*d*. each, by orders from Fellows and Members only.

Should the weather prove wet, a New Gate connected with the Tents will be opened, so that Company may view the Plants without being incommoded by Rain.

Tickets and further particulars at the Gardens.

GLOXINIA ROSEA ALBA; Figured in the present Number of the "Florists' Journal."

Extract.—"Our present illustration, G. rosea alba, is an hybrid obtained from seed of *candida*, impregnated with the pollen of *rubra*. Its beautiful intermediate colour at once proclaims its origin; and we have no doubt it will speedily become a favourite."—*Florists' Journal*, May 1, 1844, by the Editor.

The flower is of a lovely and delicate rose colour, with a pure white throat; habit of G. rubra, and a prolific bloomer.

Strong Plants now ready for sending out, at 7*s*. 6*d*. each; discount to the trade, if three plants are taken. Apply to Wm. E. Rendle, Union Road Nursery, Plymouth.—May 16, 1844.

CHEAP GERANIUMS, FUCHSIAS, CALCEOLARIAS, CHRYSANTHEMUMS, PANSIES, DAHLIAS, &c.

THOMAS APPLEBY begs to refer the Readers of the *Chronicle* to his Advertisement of the above popular tribes of plants, in this Paper of the 11th inst., and regrets that in the hurry of the moment he should have omitted to attach the prices to some of the miscellaneous plants, which omission is now added, as below.

	each.—*s*.	*d*.		each.—*s*.	*d*.
Hibiscus Cameronii	2	6	Chelone centranthifolia	1	6

PANSY, "Lady Alice Peel."—In every respect one of the best Show-Flowers of the present year; raised by Youell & Co. in 1843. Blooms were submitted for the opinion of the Editor of the *Gardeners' Chronicle*, a description of which will be found under "Notices to Correspondents," in *Gardeners' Chronicle* of April 27, page 218.

Strong plants are now ready for sending out, post-free, at 3*s*. 6*d*. per plant.—Great Yarmouth Nursery, May 16, 1844.

GLOXINIA CERINA.

MESSRS. MOUNTJOY and SON have much pleasure in offering fine strong plants of this beautiful variety, at 21*s*. each. It is a Seedling between Gloxinia rubra and Sinningia guttata, partaking of the habit of the latter parent, with large, downy foliage. The flowers are of a delicate, waxy flesh-colour, with a dark pink throat. It was awarded a Certificate of Merit at the Horticultural Society's rooms last summer, and received a Prize at the July Exhibition of the Royal Botanic Society, Regent's Park. An allowance to the Trade.—Ealing, May 15, 1844.

T. & C. LOCKHART & DUNCAN, Florists, &c., 156, Cheapside, London, beg to announce that they can supply strongly-rooted plants of Paulownia imperialis or Fox-Glove Tree, at 2*s*. each, package included. This plant, from Japan, is perfectly hardy, and highly ornamental.—May 17, 1844.

SUPERIOR NEW SWEDISH TURNIPS.

WARNER AND WARNER, SEEDSMEN, 28, Cornhill, London, beg to introduce to their Friends the following New Swedish Turnips, which for their general good qualities stand unrivalled; growing to a large size, being small in the top, of a dark yellow flesh, and may be grown as close to each other as a Stone or Stubble Turnip.

WARNER'S RUSSIAN SWEDE . . 2s. 6d. per lb.
WARNER'S EMPEROR SWEDE . 2s. 6d. per lb.

Also WARNER'S Purple-top Yellow Hybrid, 2s. 6d. per lb., with all the varieties of Norfolk and Tankards, of the most genuine and selected stocks, from 9d. to 1s. per lb.

NEW AND SUPERB CHRYSANTHEMUMS.

YOUELL AND CO. beg to call attention to the following select List of CHRYSANTHEMUMS; the plants are strong and healthy, and ready to be forwarded per Post free to any part of the United Kingdom, at 12s. per dozen, the selection being left to the purchaser or to Y. and Co. They will be found very desirable to those who intend exhibiting at the Autumnal Exhibitions.

The above Plants carefully packed and forwarded to any part of the United Kingdom. A post office Order or reference for payment in Town. Persons erecting Greenhouses or Conservatories can be well supplied with the choicest and best of Plants for furnishing, including the many handsome Climbers recently introduced.

N. B.—Plants securely packed for exportation.—Albion Nursery, Stoke Newington, London.

WILLIAM E. RENDLE can supply the following at the Manufacturers' prices, having been appointed Agent for the sale of them:—

WHITNEY'S TRANSPARENT COMPOSITION, in bottles; quarts, 4s 6d.; pints, 2s. 6d.
HUMPHREYS'S COMPOUND, 1s. 9d. per bottle.
CAMPBELL'S CORN-PRODUCING LIQUIDS.
HENRY HUNT'S PATENT GARDEN-POTS and STANDS, in fancy or common ware.
POTTER'S GUANO.
STEPHENSON'S CONICAL BOILERS.

WILLIAM E. RENDLE'S BOOK-CATALOGUE of GERANIUMS, DAHLIAS, FUCHSIAS, CAMELLIAS, NEW PLANTS, &c., has been just published, and can be had on application.—Union Road Nursery, Plymouth, May 17, 1844.

SHADES FOR GREENHOUSES.

J. WEEKS & Co., ARCHITECTS, Hothouse Builders, &c., Gloucester-place, Chelsea, beg to inform Horticulturists that they have made great improvements in their excellent and simple plan of Shading, whereby the largest or smallest can be instantly covered or uncovered with a sheet of canvas. To be seen in use at most of the London Nurseries, and at the Horticultural Manufactory, Gloucester-pla., Chelsea, near Sloane-sq.

LYNDON'S PATENT GARDEN SPADES.—These excellent Spades, warranted to bear a knife edge, and wear as long as three Spades made in the usual way, are sold by JOHN SHEWEN, Ironmonger, Sevenoaks, to whom orders may be addressed, and will receive prompt attention.

JOHN RIVERS, Sawbridgeworth, Herts, begs to inform Agriculturists in general that the MANGOLD WURZEL and SWEDISH TURNIP enumerated beneath are new and of his own growth, and can be recommended with confidence. The Russian Swede, with yellow skin and yellow flesh, was imported by him in 1835, it has been since carefully selected, and is recommended for productiveness and superior hardiness, and for its not being so liable to mildew as the Liverpool and other dark-coloured varieties.

Long yellow Mangold Wurzel, growing much out of the ground, fangless, with fine top . . . 1s. per lb.
White-fleshed, purple-skinned Globe, for thin soils, 1s. per lb.
Long Purple, superior stock . . . . . 9d. per lb.
Russian Yellow Swedish Turnip . . . . 2s. per lb.
Carriage paid to London.

Lawn Grasses, mixed with dwarf Clovers, warranted to insure a fine sward (weight 20 lbs. per bushel), price 14s. per bushel; Pasture Grasses mixed for any description of soil, varying in price from 8s. to 12s. per bushel; three bushels per acre recommended upon a clean tillage, to be sown at Midsummer, with a portion of Lucerne, Perennial Clover, and Sainfoin, upon soils that are not too retentive of moisture.

If a description of the soil intended to be laid down is given, J. R. trusts, by attentive observation of the various Pasture-Grasses, both separately and in pasture, upon various soils, to give satisfaction to those favouring him with their commands.

WM. JOHN CORMACK, AGRICULTURAL SEEDSMAN by Appointment to His Royal Highness PRINCE ALBERT, New Cross, Surrey, and Bedford Conservatory, Covent Garden, begs to call the attention of the Nobility, Gentry, and Agriculturists in general to his combinations of GRASS SEEDS for Permanent Pasture, the Alternate Husbandry, Parks, Lawns, &c. (as recommended and practised by his partner, the late Mr. GEORGE SINCLAIR, Author of the "Hortus Gramineus Woburnensis.") Upwards of 25,000 acres have been converted to permanent pasture by this establishment with the greatest success. Parties requiring Seeds are respectfully requested to state the nature of the soils. Mangold Wurzel, Carrot, and Turnip-seed of excellent sorts, saved from transplanted bulbs. Garden and Agricultural Seeds of the best quality and most approved kinds.

N.B.—Cormack's British Queen and Prince Albert Peas, at 3s. 6d. per quart.

WOODLANDS NURSERY, MARESFIELD, NEAR UCKFIELD, SUSSEX.

WILLIAM WOOD and SON respectfully invite the attention of their Friends, and Amateurs, to their Extensive Stock of New Plants, adapted for bedding, CAMELLIAS, GREENHOUSE and HERBACEOUS PLANTS, SHRUBS, and CLIMBERS, together with a Splendid Collection of the Newest and Best ROSES of the season, Catalogues of which may be had GRATIS on application.

W. W. & S. have the pleasure of offering the following at moderate prices, the selection of varieties being left entirely to themselves:—

FUCHSIAS, per dozen—Extra fine varieties, 6s. and 9s.; Extra new and fine do., 12s; 50 fine and distinct do., for 40s.

CINERARIAS, per dozen—Fine distinct varieties, 6s. and 9s.; Extra fine and new do., 12s. and 18s.

VERBENAS, per dozen—Good and distinct varieties, 5s.; Extra fine do., 9s. and 12s.; Extra superb and new do., 18s.

PETUNIAS, per dozen—Extra fine varieties, 6s. and 9s.

The above are now ready for immediate transit, and may be had either in strong plants, packed in baskets, or they will be supplied in smaller plants, and sent by post, at the option of the Purchaser.

*** Plants will be presented with each order, to defray the expense of carriage, &c.

Agents, by appointment, for the sale of WHITNEY'S CHEMICAL TRANSPARENT WATERPROOF COMPOSITION. Sold in Bottles—Pints, 2s. 6d.; Quarts, 4s. 6d. each, with printed directions for use.

TO GENTLEMEN, GARDENERS, AND THE PUBLIC.

CHEAP PLANTS for turning into the BORDERS.—Fregmore Scarlet and other Geraniums, 30 varieties of Fuchsias, Verbenas, Petunias, Celsias, Heliotropes, Lobelias, Salvias, Calceolarias, Mimulus, Lophospermum, Ageratums, Senecio, Musk, Damask and other China Roses—all at the low price of 4s. per dozen; and also all the new Fuchsias, Verbenas, &c. as they come out, at moderate prices.—P. PORTER, Nursery, Sussex-place, Loughborough-road, Brixton, Surrey.

N.B.—An omnibus, from Gracechurch-street, passes the Nursery six times a day.

SPLENDID NEW SEEDLING LOBELIAS.

F. C. BALL, NURSERYMAN, Taunton, (successor to Mr. JOHN YOUNG,) begs to offer the following as decidedly the best Scarlet Lobelias known, viz.:—

Lobelia fulgens multiflora.
,, ,, ,, variety.
,, ,, pyramidales.

All partaking of the free growth of L. ignea, and in colour exceeding the vivid scarlet of L. fungens; particularly the first, which is also very desirable from its robust habit and long continuance in bloom. Last season in the greenhouse its flowers were conspicuous for four months. Plants are ready for immediate delivery, price 5s. each. May 15, 1844.

BURBIDGE AND HEALY'S NEW BOILER and FURNACE for HORTICULTURAL PURPOSES.
Registered under 6 & 7 Vict., Cap. 65.
No. 130, FLEET STREET, LONDON.

BURBIDGE and HEALY respectfully inform the Horticultural Public that they have constantly on hand an extensive assortment of their new Boiler and Furnace Doors. In very numerous cases where they have been fixed, they have the highest testimonials of their complete success: for the further assurance of those who may require this apparatus, BURBIDGE and HEALY refer them to the Horticultural Society's Gardens, Chiswick; also to Mr. GLENDINNING, Garden Architect, &c. &c., Chiswick Nursery, in the same neighbourhood, where the apparatus may be seen in successful operation, in connection with their new Tanks. The following are the present prices:—

Plain Boiler.		Patent Door and Frames.	Fire-bars & Dead Plate.	Flue Door.	Damper.	Will heat of Pipe.	Forcing Pit, Length by feet.
in.	£ s.	s.	s. d.	s. d.	s. d.		
10	1 5	20	7 6	6 6	2 6	30 feet.	12 to 20
Ribbed Boiler.							
10	2 2	20	10 6	7 6	2 6	50 to 70 ft. 4 in.	Under 25 to 40
12	2 15	30	12 6	7 6	3 6	80 to 125 feet.	40 to 65
14	3 10	35	17 5	8 6	4 6	150 to 250 feet.	65 to 100
18	5 5	42	25 0	8 6	5 6	300 to 400 feet.	Warm a grapery 35ft. long, and a pit 50ft.
24	8 15	50	35 0	8 6	7 6	600 to 800 feet.	

If 3-inch pipe be used, one-third more. If 2-inch pipe, as much more.

The above quantities are rough estimates, which may be varied by enlarging or contracting the fire, or by regulating the fire door. It is possible to heat a much larger quantity of pipe with the boiler, but it would be done at great loss of fuel. The above proportions can be generally relied on as a near approximation to what is correct.

WIRE-WORK, HOT-WATER APPARATUS, GREENHOUSES, &c.

ST. THOMAS BAKER, MANOR-HOUSE, MANOR-PLACE, KING'S-ROAD, CHELSEA, Manufacturer of INVISIBLE WIRE FENCE, to resist Grazing Stock, and rendered Rabbit-proof. WIRE-WORK in Trainers, Arches for Walks, Bordering, Flower-stands, Pheasantries, &c. HORTICULTURAL BUILDINGS, Green and Hothouses, Conservatories, &c. The same heated by HOT-WATER APPARATUS, on improved and economical principles.

Parties waited on in Town or Country, and Drawings and Estimates free. Work for the Trade as usual.
Ward's Cases, or Domestic Greenhouses.

Sales by Auction.

KENTISH TOWN.—TO GENTLEMEN, FLORISTS, & Others.

MESSRS. PROTHEROE & MORRIS will submit to public competition, on the premises, Hawley Place, Kentish Town, on MONDAY, May 20, 1844, at One o'clock, (by order of the Executrix of the late Mr. Archer,) the entire Stock of choice TULIPS, consisting of most of the approved kinds; also Iron Hoops and Canvass, excellent Tulip Boxes, and other Effects. May be viewed prior to Sale. Catalogues may be had on the premises, and of the Auctioneers, American Nursery, Leytonstone.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE & MORRIS will submit to public competition, at the Auction Mart, Bartholomew-lane, on TUESDAY, May 21st, and THURSDAY, 23d, 1844, at 12 o'clock, each day, a fine Collection of DAHLIAS, comprising all the leading varieties. Also a splendid Assortment of GERANIUMS, the newest varieties of FUCHSIAS, VERBENAS, HEARTSEASE, &c., and a variety of other Flowering Plants. May be viewed the morning of Sale; Catalogues may be had at the Mart, and of the Auctioneers, American Nursery, Leytonstone.

FLORICULTURE.

TO BE SOLD BY AUCTION, By Wm. WILDE, On Saturday, May 25, 1844, at Eleven o'Clock precisely, at the Artists' Room, Exchange-street, Norwich, TWO BEDS, consisting of upwards of 1200 of the most RARE AND CHOICE TULIPS. They will be sold by Catalogue in small Lots, offering a fine opportunity to Amateurs and Florists to complete their Beds.

TO NURSERYMEN AND FLORISTS.

TO BE SOLD by Auction by W. FISHER, without Reserve, for the benefit of Creditors, on THURSDAY, the 23d day of May, 1844, on the Premises in Rose-lane, near the Botanic Garden, the STOCK of Mr. JOHN BIRCH, consisting of a Bed of 46 Rows of TULIPS, including Garrick, Shakspeare, Wilmer's Duke of York, Violet Alexander, Princess Sophia of Gloucester, Fabius, and other fine Varieties; about 300 Pairs of CARNATIONS and PICOTEES, now planted in their blooming-pots, comprehending most of the leading Varieties; 100 Pots of AURICULAS, including Lee's Colonel Taylor, Imperator, Booth's Freedom, Conqueror of Europe, Fletcher's Ne Plus Ultra, Othello, Blue Bonnet, Jupiter, &c.; about 30 Plants of fine-named Varieties of POLYANTHUS; Bed of choice PINKS, and a Collection of PANSIES. The Flowers may be viewed the morning of Sale, which will commence exactly at eleven. Catalogues will be ready three days prior to the Sale, and may be had of Mr. BATES, Summer Town; the Auctioneer, Littlegate; and Mr. HOBBS, 23, St. Giles's, to whom all persons having any claim on Mr. BIRCH are requested to send particulars by the 27th instant, or they will be excluded the benefit of a division.

TO LET, A FARM OF 170 ACRES.—PRIORY FARM, Warbleton, Sussex; comprising a large Farm House, fit for a respectable family, with workmen's Cottage, Barns, Stables, and all necessary Agricultural buildings; together with about 170 Acres of Arable, Meadow, Pasture, Hop, and Orchard land; with Gardens; and about 12 Acres of good Marshland, in Pevensey Level. Possession at Michaelmas next. To view the same, apply to JOSEPH PANKHURST, Warbleton; and for terms, to Messrs. PATTENDEN and SMITH, Hop-factors, 247, High-street, Borough.—The right of Sporting over the above, as also some extensive Woodlands adjoining, may be had if required.

TO BEE-KEEPERS.

A. PETTIGREW, Wrotham Park, Barnet, wishes to inform Bee-keepers that he will privately, for 10*s.* each, give them a hint on Bee-management, worth 10*l.* The hint is of prime importance to all, but A. P. will not bind himself to communicate it to fewer than 100 apiarians.

N.B. If any say that the hint is too dear, or that it will not enable him to make 5*l. extra* of his Bees this year, A. P. will return his money.

The Gardeners' Chronicle.

SATURDAY, MAY 18, 1844.

MEETINGS FOR THE FOLLOWING WEEK.

Wednesday, May 22 . Society of Arts . . . 8 P.M.
Friday, May 24 . Linnean Anniversary . . 1 P.M.

COUNTRY SHOW.—Friday, May 24 . Tunbridge Wells Horticultural.

THE statement by Mr. Baker's gardener respecting the HARDINESS OF THE MEXICAN CONIFEROUS PLANTS, cultivated at Bayfordbury, in Hertfordshire, (see p. 260) will, we doubt not, have been read with interest; more especially since it will be a guide to those who wish to plant these beautiful trees in the open air. In the Garden of the Horticultural Society similar conclusions have been arrived at in most cases; but as all the specimens there have been slightly protected during winter by hand-glasses, it would not have been safe to form any decided opinion from that evidence, while standing alone. We have now, however, before us, along with this evidence, the experience of Mr. Frost, at Dropmore, and may therefore venture to speak on the subject with some confidence; more especially since the return of Mr. Hartweg, by whose indefatigable exertions our Mexican Pines were principally discovered, enables us to ascertain more exactly the natural stations of the species in their own country.

We know that PINUS LLAVEANA is hardy, because it endured the sad winter of 1837-8. Its locality may therefore be taken as an indication of what may be expected from others. Mr. Hartweg saw it on the mountains near Zimapan, Cardonal, and San José del Oro, (lat. 21°) at the height of 8000 feet above the sea; and also found it near Real del Monte (lat. 20°) growing within two miles of Abies Douglasii, and at the same elevation. The habits of the two may therefore be taken to be similar. It has died, indeed, at Dropmore, in consequence of having been damaged in 1837-8; but that seems to be an exceptional case.

In the Horticultural Garden it has been found that P. OOCARPA is very tender; and the same result has been observed at Bayfordbury. Mr. Hartweg gathered it on the western declivity of the high Table Land, towards the Volcano of Jorullo, near Morelia (lat. 19°), a very warm situation, and in places not more than 3000 feet above the sea. He did not see it higher than 5000 feet, which is 3000 feet lower than P. Llaveana. P. oocarpa may therefore be regarded as tender.

P. LEIOPHYLLA is found below P. Llaveana, not ascending higher than 7000 feet on the mountains of Mechoacan (lat. 19° 30″). This plant has perished at Dropmore and Bayfordbury, but has only lost the points of the shoots and some of its leaves in the Garden of the Horticultural Society, although unprotected. Hopes may therefore be entertained of it in warmer situations in this country.

P. PSEUDOSTROBUS was greatly injured at Bayfordbury, perished at Dropmore with the first frost, and has also suffered in the Garden of the Horticultural Society. Its station is as low as 7000 feet near Angangueo, in lat. 19° 30″, but as it was seen 1000 feet higher, it may possibly bear our climate in some districts.

P. TEOCOTE, from Oaxaca and Real del Monte, at the height of 6-8000 feet; MACROPHYLLA, of which one tree only was seen in a Pine wood, called the Ocotillo, between Real del Monte and Regla, at the height of 7000 feet; and DEVONIANA from the same place, but a thousand feet higher, have proved hardy at Bayfordbury, and have not suffered in the garden of the Hort. Society. The two last have, however, died at Dropmore; while the first has stood. Neither have P. RUSSELIANA, APULCENSIS, and MONTEZUMÆ, all Real del Monte species, occurring at the elevation of 8000 feet, that is to say, at the same height and in the same latitude with P. Llaveana, been found tender. They stood at Chiswick, Dropmore, and Bayfordbury, and may all be regarded as hardy.

According to the Dropmore and Bayfordbury observations, P. PATULA is also hardy; and its natural station, about Real del Monte, 1000 ft. higher than any of the last, would seem to render that certain. It has, however, been found, in the Horticultural Society's garden, without the guard of a hand-glass, to sustain injury in its leaves and partially in its shoots.

There remain the PINUS HARTWEGII and AYACAHUITE, which are both Mexican and Guatemala species. The former is found on the Campanario, near Angangueo (lat. 19° 30″) at 9000 to 10,000 ft. of elevation; and on the Volcan de Agua, near the city of Guatemala (lat. 14° 30″), as high as 12,000 ft. It has been found hardy both at Bayfordbury, Dropmore, and in the Hort. Soc. garden. This is perhaps only what might have been inferred from its mountain habits; but it is not a little curious that P. Ayacahuite, which goes as far to the south as the town of Quezaltenango (lat. 15°), where its upper limit is full 2000 feet lower than the last, and which died at Dropmore, should have suffered nothing from the climate of Chiswick. In Mr. Baker's collection it is not mentioned. Perhaps its apparent hardiness may be explained by its being also found near Real del Monte.

CUPRESSUS THURIFERA, [illegible] and Tlalpuxahua (lat. 19° 35″), at the height of 8000-9000 ft., and JUNIPERUS FLACCIDA, from Regla, in the district of Real del Monte, at from 6500-7000 feet above the sea, appear to be everywhere indifferent to cold.

How strange, then, it is that ABIES RELIGIOSA, a most noble tree, found as high on the Real del Monte mountains as 10,000 feet, that is, 2000 feet higher than Llaveana, should be very tender. At Bayfordbury, indeed, it is reported as being uninjured when protected by single mats; but in the garden of the Hort. Soc., and at Dropmore, all its young wood was killed by the first slight frosts of autumn. The species grows very fast and very late; its young wood is as brittle as ordinary Firs in May, and is evidently incapable of enduring cold. Those, therefore, who happen to possess it should plant it in high dry situations, where its growth will cease early in the season, so as to ripen before winter. That being effected, it should be the hardiest of the whole Mexican race.

ON the 27th of April we solicited the opinions of our readers as to the utility of publishing accounts of COUNTRY HORTICULTURAL EXHIBITIONS, and expressed our intention of shaping our future course by the number and bearing of the letters on the subject which we might receive during the succeeding fortnight. On that day our circulation was 7741; we have now received 55 letters, and therefore we conclude that 7676 of our subscribers are indifferent upon the subject. Among the writers of the 55 letters which are before us, 33 object to the insertion of the Country Shows, which it would therefore seem have but 22 advocates out of 7741.

This would certainly justify our relieving ourselves from the trouble and expense of introducing the Provincial Shows, which, as our correspondents truly allege, are always reported in Provincial Papers. Nevertheless, we admit the force of the arguments of some of their advocates, and most especially of those who regard them as a criterion of the real state of Horticulture in different localities. It is certainly not a valid, though a common argument against their insertion, to say they are unreadable. They are not intended to be read—their use is for reference at a future period; and for that reason their record in country Papers, which are never filed, is insufficient. One of our correspondents rightly observes that, "although the report *to-day*, of *yesterday's* Flower Show may not be very interesting, yet some 20, 30, or 50 years hence, that part of a Journal which consists of a *record of facts* will, I suspect, be the most interesting part of it. If a *Gardeners' Chronicle*, dated 50 years back, were now placed in my hands, I should consider the advertisements of the 'Youell and Co.' of that day, and the records of the Flower Shows, exceedingly entertaining at least, perhaps instructive, and certainly valuable. Some nine or ten years ago, I used to consider the long accounts of Flower Shows, which were occasionally copied into the 'Gardeners' Magazine,' as a bore; but I now find them becoming more interesting and valuable in proportion as they become older."

We admit the justice of these and similar observations, and therefore we have decided to continue our reports. We shall not, however, burthen those who dislike them with their appearance, to the exclusion of other matter, but shall print them from time to time in double Numbers, like that of last week.

There is, however, one rule which we propose to adopt, to which no person should object; and that is, to omit all names of persons, rewards, &c., where the names of the plants for which the rewards are given are not distinctly specified. When, however, reports of Shows are sent to us without any such information, we shall not wholly omit them, but merely insert a short paragraph explaining the general nature of the Exhibition.

FUCHSIAS.

(*Continued from page* 243.)

The second or intermediate stage of growth in Fuchsias is from the period of the second and last potting in May or June (whilst in the forcing-house) to their final position in a well-ventilated greenhouse.

A pulverised sandy loam having been recommended for the first potting, it should, in their last shift for mature growth, be exchanged for a yellow, turfy loam, of stronger texture, using nearly one half of well-decomposed leaf-mould or cow-dung, in a partially dried state, with one fourth portion of sand; or if the loam is of a sandy texture, one sixth will be sufficient.

Occasionally there exists a great difference in the material used as leaf-mould. Pure leaf-mould is generally found in a coarse and partially decomposed state. Another kind has the texture of highly-decomposed black manure, in a loose state, without any apparent remains of leaves. Both should be used in a relative degree of coarseness to maintain an increased circulation of water for a given period after the last shift.

The following process of obtaining leaf-mould (in [illegible] texture, is repeated for [illegible] other material for potting) of a uniform ability to soils in general.

Supposing a portion of pure leaf-mould to be so much decomposed as to resemble dust, so that when water is applied it becomes close and retentive, place portions of it in a sieve, one or two eighths of an inch wide in the wire, and by slightly sifting the material, it will pass the small portion through, and the remainder, by being entirely rubbed through a sieve of four or six eighths of an inch, will leave the whole material in a uniform state for heavy potting in more delicate plants than Fuchsias. For the last-named plants, any pulverised material will be best prepared by the hand. In highly-decomposed vegetable matter, like dung in a friable state, there is always found a certain portion in a coarse, close, and unbroken state; such, on being examined and divested of stones, earth, &c., will always be found to contain the decomposed vegetable part in its coarse and unmixed state, for application in heavy shifts. This material should be broken throughout, and divested of worms, &c., by the hands of the cultivator, and on no account be passed through a sieve. It is best obtained when laid in quantities upon the ground, previous to being housed, or round the sides of a heap, and not unfrequently amongst the refuse in ordinary siftings.

Where the loam is of inferior quality, owing to the absence of vegetable fibre, or is too sandy, obtain a portion of the siftings of strong, turfy, yellow loam; divest it of stones and other refuse, and rub it entirely through a sieve six eighths of an inch wide in the wire; after which, by being well mixed with the remainder, it will render the whole more uniform and porous.

Though a pulverised condition of the turf in soils is, to a certain extent, essential in all cases, it is less so in proportion to the agencies of heat, &c. to which it is exposed, and also in proportion as the roots of plants are capable of assimilating food from nutritive material in a gross form; hence the application of these conditions to the present genus of plants in their first and intermediate stages of growth. The less pulverised or decomposed is the fibre in loam or peat, the more essential it is that their component parts should be so separated and broken as to permit the uniform action of those agencies which cause decomposition.

From the foregoing remarks, it may be inferred, that in shifting plants for the attainment of mature growth, the soils, &c., should be so arranged as to secure a strictly uniform circulation of moisture consistent with the greatest amount of material. This result does not necessarily depend upon suitable soils, nor yet upon the situation in which plants are placed, but on the general conditions upon which the successful growth of plants depends. Of what avail are the best materials apart from their appropriate "arrangement and proportions," by the hand that applies them? And of what avail is even a correct application of potting materials, apart from the knowledge and means of maintaining the agencies of light, heat, moisture, &c., which are essential exactly in proportion to the effects sought for? If a cultivator were asked to define the means necessary for transferring a plant of Fuchsia from a 60 to a No. 1 sized pot, with success, it might be as follows:—Give me suitable soils, with a perfect command of exposure to intense atmospheric and solar agencies, and I will show the highest possible effects under those conditions, and such are the necessary conditions for the highest effects of cultivation generally.

In the process of shifting Fuchsias from 32s and 24s to Nos. 8, 6, and 4 pots, the bottom drainage should be large in proportion to the pots, and uniformly placed, not exceeding 2 inches in a No. 6, and so on in proportion; the sub-drainage of coarse partially-dried turfy peat, with leaf-mould, or flakes of cow-dung, in a similar state, to the depth of 2 inches, each firmly pressed. The mixture is then filled in till the ball of the plant may reach within half an inch of the top level, and when the ball is made firm by a portion of soil around it, apply a few handfuls of coarse leaf-mould, or broken cow-dung, with charcoal, or crocks intermixed, and finish by filling up to the level of the ball. The ball of each plant having been in a sufficiently moist state previous to the operation, the plants are removed back to the platform of the forcing-house, without air for two days, but well shaded from sun-light, and heavy syringings substituted alternately for waterings, during the following week (allowing for casual instances).

The conditions of growth above stated, are those by which a collection of Fuchsias was grown by the writer, in the summer of 1843, the unexpected success of which has led to the present remarks. As previously stated, the growth of the plants commenced in March and April. F. formosa elegans, was, at the first mentioned period, 6 inches in height, and by the first week in August, attained nearly 7 feet, forming a perfect pyramid

of uniform growth and bloom, the lateral branches extending 2 feet from the main stem, thus giving a circumference of 8 feet. F. Rogersiana (a cutting of the current year), was also as much in circumference. F. racemiflora elegans (a cutting) formed a very graceful plant from 7 to 8 feet in height; F. conspicua arborea (a cutting) reached 6 feet; F. tricolor (cuttings) of uniform growth and bloom, was 6 feet in circumference; F. magnifica (a cutting) was the same size; F. St. Clare (a cutting), removed the third week in May from a 60 to an 8 pot, was 2 feet in diameter by the first week of August. F. rosea elegans, and Cooperi were each 12 feet in circumference. A plant of F. magnifica (a cutting) was selected from very beautifully-formed plants of the same variety grown in pits, and subjected to the above treatment [illegible] their extent of growth and bloom.—Smith's (of Dalston) varieties were received in May about 9 inches in height, and by August nearly the whole were 2 feet in diameter (in 12s and 8 sized pots), and exceeded all others by their uniform vigour and bloom.

Those who wish to speculate in dispensing with intermediate shifts, by removing from 60s or 48s to 12s, 8s, or 6s, must bear in mind the following conditions:—1, a slight elevation of the ball of the young plant, above the level of the soil around it; 2, an exposure upon a shelf, or lofty platform, to intense sunlight; 3, alternate syringings, in the place of waterings, for a few weeks; 4, the essential proportion and texture of the sub-drainage; 5, the leaf-mould, or decomposed manure, in a partially dried state; 6, the surface of the soil to be but slightly compressed until the plants are established. The importance of the last condition is in proportion to the increased size of the pot, and the diminutive vigour of the plant.—*William Wood, Pine-apple Place.*

FRENCH ROSE CULTIVATION.

THE following are a few remarks on the mode of rearing Rose-trees in France:—No French nurseryman engrafts his Dog-Roses (Eglantines) on other persons' hedges; for if so, he would require, for the many thousands of them which he plants, the command of a great deal of spare ground. He has not inclosures sufficient to maintain the number of them which he would require according to his system of culture. He employs, therefore, boys to provide him with them; and where the culture of Roses is extensive, as in the vicinity of Paris, there are people in the season who make a regular trade of gathering them wherever they can find them; so that the gardener who would engraft Rose-trees on the hedges and in the woods would only give himself trouble for the benefit of other people; he would in such a case have undoubted reason to apply to himself the "sic vos non vobis" of the poet.

According to our system, the Rose-trees which we have for sale have been nourished in our gardens before they are grafted, and brought to exhibit the beautiful varieties which we produce. If Rose-trees exported by us are ill-furnished with small roots, this deficiency has been caused by the quality of the soil in which the wild stock have been reared. Those which are grown in strong heavy land produce but few capillary roots, while those reared in light soil produce them abundantly. The truth is, that Rose-trees are transferred from our nurseries so soon, that they have not time to multiply their roots to any great extent. It often happens that Dog-Roses planted in autumn may be sold with a very strong head at the same period of the following year, which is easily accounted for by the manner in which we cultivate them.

We procure early in autumn stocks that are at least two years old, those of one year old being too thinly wooded, and liable to injury from frost; and we plant them and support them by stakes. In the beginning of February, the cuttings for grafting are cut from those sorts which we wish to multiply, and stuck into the ground, numbered, and opposite the north, in order to retard their budding.

In March and April we take them up, and graft them on the Dog-Rose Briers; and it is important that this operation should be performed when the sap of the stock Brier is in circulation (which is ascertained by the shooting of the buds). The operation of grafting, *en fente* (by cleft), as we term it, is too well known to require explanation. I shall merely remark that the stocks which, from the smallness of their diameter, can only bear one graft, should only be split at one side, and that opposite the bud nearest the upper surface of the stock, where it has been cut evenly across. This bud is designed to draw the sap into the upper part where the scion is, and to impart life to it. Two grafts may be placed opposite each other on stocks of sufficient diameter. Two buds are sufficient to have in any graft, and when this is cut in the proper wedge-form, it should be inserted in such a sloping direction as will bring the lower part of the wedge into contact with the second bark of the stock; and the lower bud of the graft should evidently be kept on the outside of the slit. Unless the graft be the termination of a branch, its upper part, to which the knife has been applied, will require to be protected by a little cement; and, if the stocks be not sufficiently large to receive the grafts completely and firmly, these ought to be tied and covered at the point of union with cement. Our composition for cement is made of rosin and pitch in equal quantities, with half as much of white wax as of the other ingredients, properly melted and mixed together.

Grafts thus placed on strong and healthy plants cannot fail; and will form a superb head in autumn, if care is taken to pinch them off to the height of from 4 to 6 inches, to make them branch. It is also necessary not to leave too many buds at the lower part, but those on the top cannot be too numerous. By this kind of grafting, a Rose-tree in full flower may be obtained in six weeks or two months.

Dog-Roses, if planted as stocks in pots, should be taken into a greenhouse early in the season; and, as vegetation soon begins there, the stocks will be fit to be grafted in a month or six weeks, and flowers will be obtained from them much sooner than from Rose-trees in the open air.—*Bataille, Curator of the Botanical Gardens at Avranches.*

BOILERS.

I HAVE a large garden, and many sorts of boilers, from the old waggon-form down to that of Messrs. Stephensons. But when I want to heat some new building, I find that the cost of even the cheapest of them is a very serious difficulty. For example, I wish to force some Seakale in an open bed. A few drain-pipes will enable me to do so; but then there is the boiler—and really it is too bad to be forced to pay 5*l.* or 6*l.* for an instrument which is to produce me a crop not worth half the money. I see, too, by your Notices to Correspondents, that many others are in a similar difficulty with myself; and well they may be. Let us then see whether a cheaper kind of boiler than any on sale may not be readily contrived.

In the section A we have a common 4-inch iron pipe, placed with one end over a fire, and the other in a tank of water. When heat is applied the water circulates in the direction of the arrows, and the heating effect is just as well gained as if the most complicated boiler were employed. But there is no setting A in brickwork advantageously.

A

B

But if the pipe has an elbow over the fire, as at B, the setting is more easy, and all the effect that we desire is obtained.

Nevertheless, people may complain of the waste of fuel and of the awkwardness of these contrivances, and with some reason, though not with a great deal, because it is to be recollected that such an apparatus is only for a temporary and slight purpose. However, to satisfy them, let us take the section C, which represents what you have occasionally recommended, an iron-saucepan, with a lid

fastened down by a bayonet-catch, and adapted to the tank by a flow and return pipe. Now here, by casting a flange, *a*, *a*, upon the upper edge of the saucepan, six inches deep, a sufficient means is offered of setting such a contrivance in brick-work, and thus a good boiler is at once furnished. I find that a common 6 gallon iron pot costs in the shops 10*s.*, and I see no reason why such a boiler as this, which is nothing but a pot with a flange and a fixed lid, should not be sold for 15*s.*, instead of four or five pounds, which is the lowest price of the hothouse boilers now in use. It would certainly answer the purpose of any dealer to sell such things, or if they will not do so, an ingenious blacksmith could make them out of an old saucepan and a piece of sheet iron, and thus the means would be afforded of applying heat efficiently to purposes in which it cannot be employed at all, so long as there is no refuge from the costly boilers of the day.—*Dion.*

ENTOMOLOGY.

ACARUS HORTENSIS (*the Garden Mite*).—When I lately had occasion to reply to a correspondent respecting this mite, I had no doubt in my own mind that it was identical with that which infests and lives upon various beetles; but upon relaxing and setting out specimens of both varieties, it appeared at once evident they were totally different, although nearly related. I therefore take an early opportunity of correcting my error; and it may serve as a lesson how unsafe it is to take things for granted, and at the same time be admitted as a convincing proof, to those who are engaged in Agricultural pursuits, that in the investigation of these abstruse subjects it is indispensable to exercise the greatest caution in the discrimination of the insects supposed to affect and injure the crops. From the communication above alluded to, it appeared that some mites abounded to such an extent in the Cucumber frames that they destroyed one set of plants, by eating off the roots, which compelled the owner to turn out the infested plants, and the soil likewise. Having done so he put in fresh soil and new plants, but these were getting as bad as the first, by the middle of March.

This Acarus differing from any of those I have seen named and described, I have called it Acarus hortensis, from its inhabiting gardens. It is oblong, shining, and of an ochreous colour, but the body is of a semi-transparent white, with a large thoracic crustaceous plate or shield of a deep ochreous tint, separated from a smaller one, of a somewhat transverse ovate figure, merely by a narrow white suture; the head is small and trigonate, with two points in front, and on each side is a slender palpus of 5 or 6 joints, and slightly hairy; it has 8 legs, the 1st and 4th pairs being long, the four intermediate ones shorter and perhaps a little stouter; they are all bristly or hairy and taper; they are, I believe, only 6-jointed, if the tarsus be not included, the last joint being the longest and most slender; from the extremity of this projects a fine whitish thread which forms the foot, and appears to be biarticulate; the apex is dilated and semicircular, forming a pulvillus, with 2 divaricating dark rays, which may be the claws. Figs. 1, 2, the same magnified.

I have added figures of Acarus coleoptratus (3 and 4), the species I at first supposed the above mite to have been; the body is more oval and broader, the horny shields are larger, with a much narrower transverse suture, and there are a few bristles scattered over them; the head is not so prominent, and it is of a darker ochre colour. These mites are generally seen running over the underside of beetles that live upon putrid animal and decomposing vegetable substances, more especially a genus of Silphidæ, called Necrophorus or grave-diggers, and of Scarabæidæ, named Geotrupes or dung-beetles,* and it not unfrequently happens that one finds a wretched individual of the latter genus sprawling on its back, or with scarcely strength to crawl, the entire contents of the body having been eaten out by this dreadful scourge.

Labouring under the mistaken impression that these were the mites which infested the Cucumber plants, I imagined they had been introduced by the infested beetles, which were conveyed into the frame with the hot manure, or had crept in whilst the glass was off; if such had been the case, a single beetle would soon have established a colony extensive enough to do the mischief complained of. But as it proves to be a distinct species of Acarus, which probably only feeds upon decomposing vegetable substances, we must trace its presence to other causes. I therefore think it very likely that it is generated in the manure, and in that case it would be advisable to sprinkle unslaked lime between the layers when it is turned over, which I expect would kill the Acari, or gas-water might be equally effective. There is also another important point to be attended to, and that is neatness and cleanliness in the frames. If the woodwork, as it frequently happens, be rotten and crumbling away, it forms an acceptable harbour for woodlice, mites, earwigs, and every kind of animal destructive to frame plants; after a crop is cleared off, and before the frames are again used, boiling water should be poured upon the parts coming in contact with the soil; they ought to be well scrubbed with soft soap, and afterwards washed with spirits of turpentine or painted on the inside; then, again, after the crop is off, whether of Cucumbers or Melons, none of the fruit should be left to rot, or the stalks to decompose there, as it cannot fail to attract and harbour Acari, &c., which when once established are frequently not readily exterminated.

I am, however, surprised to hear of "the Acari eating off the roots of the Cucumbers," and shall be glad of any information which may throw light upon the subject; for whilst the roots are healthy I should not expect that these little animals would attack them. I have detected large nests of Acari in the putrescent clubbed roots of Cabbages and in Turnips suffering from anbury, but never in those which were not diseased. I believe, however, that these Acari are scattered through the soil, and are consequently ready to fix upon any sickly plant, which speedily becomes a nidus for them, and falls a sacrifice to their attacks. It is, therefore, always prudent not to allow drooping and weak plants to remain, but to dig them up at once and burn them, or at least remove them to a distant spot, where they cannot communicate disease to the rest of the crop.—*Ruricola.*

* Curtis's Brit. Ent. folios and pl. 71 and 266.

THE ROSE-GARDEN.—No. VIII.

(Continued from page 165.)

Roses for Budding, with a pushing eye (à l'œil poussant).—The sorts most likely to succeed in this way are Chinese Roses and Hybrids, &c. Amongst which are the following:—

De Rol	Greville
Blush ditto	Multiflora
White Noisette	Double Purple
Purple ditto	Banksia
Sanguinea	&c.

Different sorts of Roses on the same Stock.—It may be observed here, that buds from Roses of different sorts may be freely placed on the same stock; but not if their manner of growing be different; that is, one free, the other delicate and slow; as the free-grower famishes the other, and, at any rate, the tree grows and looks lopsided; but if more than one Rose be put upon the same stem, reference should first be had to the similarity of growth, both in habit and vigour; secondly, to the appearance and size of the leaves; and lastly, to the habit, shape, and colour of the flowers.

Choice of Shoot and Bud.—The shoot from which the bud is taken should be healthy and vigorous, of the autumnal growth, and should look as if it were in its full strength, and on the point of finishing its growth; the wood of it also must be sufficiently ripened. The words *autumnal* and *spring*, are not intended to refer to the periods when the shoots first began to push, but to their actual state at the season of budding. The sense in which the former of these words is to be here understood, is, "continuing in a growing state during the autumn," in opposition to those shoots termed spring-shoots, which, having borne flowers at their summits, or from any other cause, are comparatively dormant at the time when the buds are required for use. The terms *flower-shoots* and *wood-shoots* may be substituted for spring and autumnal, provided we bear in mind that Chinese Roses and Hybrids form a half-exception to the rule laid down, as their buds may occasionally, and, indeed, sometimes must be, procured from flower-shoots. When, therefore, the species to be propagated is a free flowerer, and, like the Damask and du Roi, produces upon every shoot, grafting (with the exception of such sorts as may not be found to produce scions sufficiently woody) is the most eligible mode of propagation, both for the purpose of avoiding waste and insuring success. When this is objected to, those shoots should be chosen, the flowers upon which are forming, in contradistinction to such as have full-blown flowers, or their remains, at their summits.

If a spring shoot be taken, it is fifty to one but the bud is quite inactive, or else has imperceptibly opened; in which latter case, evaporation would take place before the junction became effected, and the bud would perish; of the former, the bud is not in the state required, being too torpid to effect a union.

The autumnals, also, part better from the wood, and are larger in girth, from having the strength of the sap spent upon themselves, instead of upon the flowers, (besides the circumstance of the tree being at that period in full action,) and they frequently start the same year with success; whereas the buds of the spring, in a similar case, generally fail. If the shoots are in the operator's garden, they should be cut as nearly as possible at the moment of use; if from a friend's, the ends may be placed in a watering-pot to keep them moist, and care taken to keep them from the sun, using them as soon as possible after they have been cut, which ought to be at sun-rise in the morning.

As it is frequently necessary to carry buds a considerable distance, the following mode may be adopted: trim off the leaves and points of the shoots as usual, and envelope the remainder in wet moss until an opportunity occur of plunging the shoots as above directed. The bud is found in the axil of the leaf, which ought to be cut off a third of an inch from the bud, on separating the shoot from the parent plant, in order to avoid the evaporation from it, which would weaken the bud. The look of the bud should be round, full, quite closed, and healthy; those from the centre of the shoot are preferable, as base buds are more likely to lie dormant, and those at the top are not so safe, being sometimes a little open and unripe. The leaf under the bud should be healthy, and shoot, buds, and leaves, appear of even and luxuriant growth.

Home Correspondence.

Spring Planting.—About the 20th of March I transplanted upwards of four dozen standard Roses; and they are all doing well, excepting one with which I tried an experiment. About the same time I removed Portugal Laurels, common Laurels, Aucubas, Rhododendrons, and other plants, amongst which was a Yew; all of which are doing well. These have only been watered twice, and the Roses once since they were planted; and it is scarcely possible to discern which were removed, and which were not, while those planted in the months of November and December are nearly all dead. I am not an advocate for spring planting, far from it; I only mention this in order to show that if the operation is rightly performed, plants may be removed with safety in spring. In planting, the following method has given me every satisfaction.—After inserting the plant in the pit, filling it about half full of soil, and giving it a good watering, then putting in some more soil, I trod it firmly, and on this I put about two inches of rotten dung all round, and covered it with a little soil, in order to prevent birds scraping it about. By following this plan, I have not lost a single plant.—*Peter Lowe, Portobello House.* [We do not see how this affects our argument.]

Salt v. Asparagus.—The observations you made in your Leader (No. 15, April 13), induced me to delay sending you the following observations respecting Asparagus and salt, as I wished to make as correct a statement as I possibly could. No vegetable deserves greater attention than it, and I suppose the more experiments made in its culture, if faithfully watched, the more likely are we to succeed in its improvement. Ever since you mentioned salt as likely to be beneficial, I commenced applying it, and in consequence formed an idea that Asparagus could not be injured by it; but I have bought my experience too dear. I have two beds of Asparagus. The first year I sparingly covered them in spring, and some time in summer. The second year I think I applied the salt twice, but more copiously; and last year I laid it on four times, rather thickly each time, especially the last time. Some half-dozen times I have constantly watered the beds with manure-water, from June to August. The Asparagus certainly improved, and last autumn it had attained the height of six feet, so that I anticipated a noble crop this spring. After cutting down the haulm, I gave my last and strong dose of salt (1), and perhaps three weeks after, covered the beds with long litter. The beds were uncovered early in March, and well stirred with a broad-pronged fork. It was long before any heads made their appearance, and they were of the most puny kind. Suspecting that all was not right, and fearing that my most strenuous advocacy for the salt system might come to nothing (for a friend of mine in the winter declared to me that salt had killed his Asparagus, and I had asserted that it could not do so), I commenced an examination of the beds from beginning to end; and I assure you that at least one-fourth were quite dead, quite decayed, and I never met with a single root which was not more or less injured. The upper portion near the crown of the roots was rotten: this, I say, was the case with every root, more or less. About this time, a gentleman residing in Louth informed me that much of his beds was also injured by the application of salt. These beds were not old ones—7 or 8 years old, like mine; but he had only applied the salt once. Up to this time I have carefully watched my beds, and the heads cut from them have been very mean indeed. I ought to have mentioned that the last time I examined the crowns, they were putting up very thin heads; and since they have appeared, they have presented only the same mean appearance. Upon these beds also I see several Sycamore plants coming up, so that the salt could not have been, I think, so very strong. Shall we, therefore, conclude that salt must not be very strongly applied? Of this I am quite certain, my beds are ruined, for this year at least; and I can conceive no other cause than the salt. Should I be wrong in taking one of these beds up, and mixing the soil with sea-sand and a due portion of guano, and then re-planting the roots upon the first appearance of rain? [We cannot suggest a better remedy for the mischief than that which is here proposed. But as to the mischief itself, there can be no doubt that the last dose (1) was what did the mischief. Salt should only be applied when the plants are in full growth. To put it on when the haulm is dead, is to pickle, not to manure. The following memorandum has come in while we are writing these remarks:—"I have tried salt on my Asparagus-bed, both last year and this, with the greatest advantage. I mention this to add my testimony to its value, in case it should be doubted by any of your readers who have hesitated to try it."—*T. T. H.*]

Gentiana verna.—This is a plant of great beauty, but it is very much neglected. Being easily cultivated, it is well suited for forming edgings round the margin of flower borders, where its bright blue flowers have a fine appearance. About 300 yards of this was planted as an edging to flower beds here in April, 1843. It flowered tolerably well the first season, but during this year it has been the most striking feature of the garden, and has been admired by all who have seen it.—*R. T., Hornby Castle, Yorkshire.* [Is it not Gentiana acaulis that is here spoken of?]

Hybrid Rhododendrons.—As the blooming season is arrived, would it not be desirable for the readers of the *Chronicle* to communicate, through the medium of its pages, a description of any new and striking varieties that have fallen under their notice? Much remains to be accomplished by the growers of this most exquisite tribe, as, notwithstanding the beauty of numberless hybrids, a fresh race is required, which would unite the glowing tints of the Indian species with the hardness and freedom in flowering that characterise both R. Maximum and Ponticum. At Highclere this has been done; as by crossing the finest varieties of Altaclarense with a variety of Ponticum, known as Lee's Late Purple, a collection of perfectly hardy sorts has been raised, on which no severity of the winter has any effect, and which adorn the grounds of that noble seat with flowers of a most beautiful description. These Rhododendrons combine every requisite quality, being abundant bloomers, and productive of immense trusses of large flowers, of every shade of pink and rose, crimson and dazzling scarlet, and purple, in some instances dark as the fruit of the vine; with the additional recommendation of being in perfection from the middle of May to the beginning of June. I believe that these fine varieties are not in the possession of the trade, which is to be regretted; and the object of this paragraph is to stimulate both nurserymen and amateurs to embrace the present season, and cross such varieties as may, by an intermixture of habit, colour, and size of their flowers, render their progeny equal to those I have been describing. It cannot be doubted that the union of some fine, high-coloured hybrid, with such kinds as Lee's Late purple, Ponticum, Lee's Grandiflorum (a very large flower), a rose-coloured or purple Maximum, would produce such shrubs and flowers as would not only be suited to our uncertain climate, but be the admiration of all who saw them.—*A Devonian.*

Chicory.—It has been my opinion these ten years that Chicory would become as common as Endive. It is much more easy to grow and preserve than the latter, which requires continual covering, and is very liable to rot. About three years ago I grew a quantity for Covent-Garden Market; the first lot I sold to Mr. Steptoe, and made 9*s.* 6*d.* of it; it was the first that had ever come into the market. The next market morning Mr. Steptoe shook his head, and said he had sold but two bunches, and those to a Frenchman. I, however, gave him the next lot, and the third time, having no better success, I never attempted to grow it since. For market-gardeners I would recommend them to take out a trench just in the same way as they do for Rhubarb, and to plant it in the trench, covering it over with mats and straw. No farther trouble is necessary. The best time to sow it is about the 1st of June, so that it may become very large, and not run to seed. I have grown the roots as fine as the largest Horseradish; but to do this the plants ought to be thinned out to a foot each way. The following article on this subject was sent to the "Gardeners' Magazine," in 1837:—"It is with much pleasure that I have to notice the success that has attended my cultivation of that most valuable salad-plant, the Chicory, which was brought into notice last year by Dr. Lippold. I am well aware that Chicory has been known in this country for many years, and also that it has not been cultivated to any extent; but I may safely say, that a more valuable salad-plant for winter use never was introduced. Our autumns are so changeable, that the gardener finds great difficulty in keeping Endive in a good state of preservation for winter use; while Chicory can be taken up and put into a pit for forcing at pleasure. The pit which suits it best is one flued all round, on account of damps; and it must be planted in very dry mould; the mould, indeed, cannot be too dry, as the roots are sure to imbibe moisture enough for their support. I planted them six inches apart, and found it quite enough; the heat required is very little, but that must be regulated by the quantity of Salad to be raised. In place of taking the outside leaves, I cut the head close down, though not so low as to injure the second cutting. Some of the heads produced enough for one salad each, along with other small salads. Every gardener who has to produce good salads during the winter ought to provide himself with Chicory, and if he has not got flued pits, the next best place is any shut-up or inclosed shed; if there is a stoke-hole with fire so much the better, but no light must get at it, as it must have a fine cream colour when fit for table. Market-gardeners would also find Chicory a most valuable salad when their Endive was all over."—*James Cuthill, Camberwell.*

Sparrows.—People complain of the loss of their Gooseberries this year by birds—for birds, I imagine, we should read grubs. I had a tree loaded with blossom, and it is now all blank; I saw six or seven sparrows on it at a time, and was induced to watch them closely. I saw one knock his bill against a leaf and eat something; at last he knocked one of these somethings to the ground, when I ran and frightened him away, and found his lapsus humi was a green caterpillar. I now examined the tree, and found that sparrows did not eat the Gooseberries. Every third or fourth leaf contained one of these depredators—of a sort that let themselves to the ground by a gossamer thread. Black Currants are all gone by the same marauders.—*F.*

Rabbits.—These are easily taken alive, by soaking their favourite food, Parsley, in strong rum or brandy. A similar method is employed in catching small birds with steeped seed. They, like the rabbits, are so intoxicated by the spirit, that there is no difficulty in obtaining as many as you wish.—*J. R. L.*

Morphology.—It is due to the genius of "R. E." to express gratitude to him for his very instructive letters on Familiar Botany; his plain, unvarnished exposition of the gradual changes that the organs of plants undergo, must ultimately lead the most sceptical to embrace the doctrine of Morphology. It appears to me as reasonable and as possible that flowers should be metamorphosed leaves as that many insects change first from the (ovum) egg into the (larva) caterpillar or maggot, then into the (pupa) chrysalis, and lastly into the (imago) fly, or perfect state. While the butterfly lies in the body of the caterpillar, its wings are long and narrow and wound up into the form of a cord, and the feelers are rolled upon the head; the trunk is also twisted and laid upon the head, but in a very different manner from what it is in the perfect animal, or indeed in the pupa state. How similar that is to the leaf of a Pæony and its petals, the same organ in different states, as is clearly proved in the last letter of "R. E." That a tadpole should become a frog appears more wonderful than that leaves should be metamorphosed into flowers; the egg of the frog being laid in the water produces that lively little animal the tadpole; after some time legs and feet burst through the skin, the tail drops off, and he is a perfect quadruped. The amusing and useful letters of "Ruricola" have given to the readers of the *Gardeners' Chronicle* many examples of the various metamorphoses by which insect life proceeds from the ovum to the perfect state. As another instance, in confirmation of the change of leaves into sepals and petals, so clearly explained by "R. E.," I beg to direct the attention of the unbelieving, or those doubtful on the subject of Morphology, to a bed of Tulips, where is frequently to be seen at this season of the year that

the leaf is marked with streaks and colours similar to the flower. There is one of that sort in our Tulip-bed, which is confirmation strong that flowers are metamorphosed leaves. These are phenomena rejected as absurdities by those persons who repudiate every discovery in Nature which does not come within the scope of their own pre-conceived notions, and who exhibit a degree of violence in their opposition to it, proportioned to their ignorance of the subject. The investigation of Morphology should be pursued with an earnest and honest desire to elicit truth, rather than a determination to find some flaw in the operation, by which they might raise a clamour against the principle and its supporters.—*W. P. Keane, Leybourne Grange.*

Seedling Pelargoniums.—I have flowered plants of these three weeks ago, that were raised from seed sown August 28, 1843. The size of the plants will show that they are not stunted specimens. They stand 18 inches above the surface of the pots, and are 2 feet in circumference. The thickness of the stems is 1½ inch, and numbers of the leaves measure either way 6 inches.—*J. Sherriff, Lodge Road, Hockley.*

De Candolle's Prodromus.—Having just received the eighth volume of De Candolle's "Prodromus," I am sorry to find the Monograph of the Primulaceæ by Duby very inferior in its execution to the others, and it is a pity to see so many omissions. For instance, amongst many others, what has he done with Primula helvetica (Don.), fig. in the Bot. Cabinet, t. 348? Is it Primula microcalyx? No mention is made either of the name, or figure. What has he made of Primula Simsii, Botanical Magazine, t. 1161? This is passed unnoticed, like P. helvetica, as is also P. nivea (Fisch.) These probably are only varieties of P. villosa, but they ought to be taken up. When a Monograph is written in such a valuable systematic botanical publication as the "Prodromus," it ought to be done with extreme care, and, if possible, without the omission of any described plant; but these omissions, in my opinion, arise from extreme carelessness. Indeed, the details seem very indifferent when compared with the other Monographs. In the same volume, Sir J. E. Smith's "English Flora," which is our standard authority for British Plants, is passed over, and not quoted for the three Primulas—which belong to Britain—as is also English Botany. It will be beneficial, I imagine, if you will notice these omissions; and if you will examine the Monograph you will find many more. By noticing these omissions, M. De Candolle may be induced to supply the deficiencies in the Appendix to the next volume. Should Mr. Duby be engaged to write any more articles, it is to be hoped he will bestow more care, and not suffer so valuable a work to fall off in public estimation.—*F. B. W., Cambridge.*

A Full Trap.—Mr. Marsden lately found in a small common iron spring rat-trap, in his shop at Cabus, near Garstang, no less than four full-grown rats; two of them were held by the tail, and the other two each by a leg. I saw them in this pleasant position.—*Facile.*

Miscellaneous.—"Delta" remarks, that he never saw a honey-bee extracting either honey or pollen from the Polyanthus. He writes, that he has long been both an apiarian and a large grower of Polyanthuses, and that he has taken particular notice of the fact.——*Mr. J. Linton, of Hulme, Manchester*, informs us that he lately cut a Cowslip out of his garden, with a bloom consisting of 180 pips, and a stem 1 foot long. This, he considers, is rather remarkable.——*A Gardener* states that Sphenogyne speciosa stood the winter of 1842 with him, under a wall having a south aspect, and flowered in March, 1843. He has this year sown seed in the open ground, and says that the plants are about half an inch high.

Societies.

SOCIETY OF ARTS.

May 15.—Sir J. J. GUEST, Bart., M.P., V.P., &c., in the chair. The Secretary read a paper on the Improved Management of Bees; the materials for which were partly obtained from the Society's Transactions, but chiefly from Mr. Milton, Mr. Neighbour, and Mr. Sholl, apiarians. Several bee-houses and hives, as recommended by the above-named, were placed before the meeting.—Mr. Sholl's bees have been at work on the Society's premises since April 17, and the results of their labours were shown to the meeting. The first accounts of bees are contained in the writings of Varro, Pliny, Columella, and others. By Columella, the celebrated writer on husbandry in the reign of Claudius Cæsar, the subject is treated at considerable length, and contains all the information on the subject known in his time. About the 16th century this subject attracted the attention of many eminent persons in various parts of Europe. Gervase, Markham, Gawson, Stephens, Sufflet, and others translated the "Maison Rustique" in 1529. In 1539, Ruccellai produced his beautiful poem "Api;" following these, Mr. Thomas Hyll and Edmund Southorn, were busily engaged on the subject. In 1609, Charles Butler, the father of English apiarians published his "Feminine Monarchie," containing valuable observations on the instinct and habits of bees. In 1654, we find that great architect, Sir Christopher Wren, while at Oxford, engaged in the delightful study of bees, (a large drawing of whose storified hive, consisting of three tiers of octagonal boxes, was shown to the meeting). In 1655 Mr. S. Hartlib drew the attention of apiarians to the subject of glass hives and boxes. Dr. Butler, and all before his time, used only common hives, made either of reeds or straw. Maraldi in France, Swammerdam in Holland, and Dr. Gedde (1675), Dr. Warder, and the Rev. John Thorley in England, all paid much attention to the subject. The Rev. John Thorley's bee apparatus was presented to the Society by Sir Charles Whitworth, in 1763, and was the model recommended to be followed by apiarians, the Society having at that time offered 200*l.* to the persons who should collect the largest amount of merchantable wax without destroying the bees; and from that year to 1821 the Society continued to encourage, by their rewards, every real improvement in the management of bees. In Varro, "De re Rustica," Book III., chap. 16, a curious account of the profit to be devived from bee-keeping, beginning with "De fructu authorem habeo," &c. &c, the translation of which is as follows:—"Of the fruit (profit) I have not only a witness who says he lets out his bees for 5000 lbs. of honey by the year, but also our friend Varro, who had with him in Spain two rich brothers, soldiers, to whom their father left a small country-house, and a little field of about one acre; near to the house they formed an apiary, and also a garden, which was planted with Thyme, Cytisus, and Balm. Taking one year with another, their profit from bee-keeping never amounted to less than 10,000 sesterces, equal to 83*l.* 6*s.* 8*d.* English money." The following bee-houses and hives, &c. &c., were placed on the table, but their description would occupy too much space, viz.: ESPINASSE's Bee-house — MILTON's Common-straw Hive; Do., with cap; Do., with revolving-top; Miniature Apiary; Box Hive, with interior cases; Huber or Leaf Hive; Unicomb Observatory Hive; Storified Box Hive; American Transparent Bee Palace—NUTT's Improved Hive, with pavilion and collateral apartments, having a thermometer and ventilator attached—NEIGHBOUR's Improved Single Box Hive; Cottage Hive, with ventilators and thermometer; Ladies' Glass Observatory Hive; Simple Cottage Hive—SHOLL's Bee Castle, with pavilion, &c.; Hive of Glass; Portable Barrel Hive—THORLEY's Bee Apparatus.

Reviews.

The Cryptogamous Plants of Dr. Roxburgh, forming the Fourth and last Part of the Flora Indica.

By W. Griffith, Esq.

THE name of Roxburgh stands first among those of the botanists who have investigated the vegetation of India. Although not a man of high scientific attainments, and living at a time when the true principles of classification were little known, yet his extraordinary diligence, zeal, and good sense, more than compensated for such deficiencies. It is not much to the credit of other botanists that so little justice should have been done to his labours. For years a manuscript copy of his "Flora Indica," in the library of Sir Joseph Banks, was, in this country, the only accessible record of his labours; his Indian editors of the work, Drs. Wallich and Carey, carried it no further than a second volume, out of many that would have been required; and when, at last, the bulk of his manuscripts was published by his sons, in justice to their father's memory, no botanist revised the sheets, so that the work appeared with all the blemishes arising from ignorant Indian transcribers. Yet it is a monument of industry that Dr. Roxburgh's relations might well be anxious to raise, and the foundation of the systematical botany of the peninsula of India. Mr. Griffith, the acting superintendent of the Botanic Garden, Calcutta, has now stepped forward, and, in a manner worthy of his distinguished rank as a botanist, has rescued from oblivion Dr. Roxburgh's account of the Cryptogamic vegetation that was known to him.

The Cryptogamic plants described by Dr. Roxburgh were chiefly Ferns; and Mr. Griffith hopes, by the present publication, to secure for his name the authority to which they are justly entitled. He calls upon botanists to "exert themselves, and determine that his MS. names shall not be passed over in favour of any other MS. names, given in neglect of Roxburgh's characters, descriptions or drawings; any more than zoologists will show countenance to similar names in the most marked case of the zoological labours of Buchanan;" and adds, "I wish here to call the attention of the scientific world to the fact, that no explanation has been yet given by Mr. John Edward Gray, of the appearance of copies of Buchanan's zoological drawings, without the slightest acknowledgment, in the 'Illustrations of Indian Zoology' of General Hardwicke."

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

CYMBIDIUM PENDULUM, var. brevilabre. Short-lipped thick-leaved Cymbidium. (*Stove Epiphyte.*) Orchidaceæ. Gynandria Monandria.—As far as our experience goes, the ordinary variations to which Orchidaceæ are subject, are in all respects analogous to what is met with in other plants, and as is exemplified by the plant before us from Sincapore, in which, while the lip becomes shorter, broader, and with a much blunter middle lobe, everything else remains so exactly the same, that nobody can entertain a doubt about the specific identity of the plant with Cymbidium pendulum. The vertical plates of the lip, in particular, are quite unchanged, showing, as we find it always shown, that the elevations and processes of the surface of the lip are of the utmost importance in considering the limits of species. Eria bractescens and longilabris, furnish the converse of the rule. They are much alike, and their labella vary in form in a manner not unlike that of C. pendulum and C. p. brevilabre; but with a change in the form of the lip occurs in these plants a most material alteration in the form of the labellar processes, and both are connected with other peculiarities in the appearance of the two species. This plant was received by Messrs. Loddiges from Mr. Cuming, who found it at Sincapore. It should be grown in turfy heath-mould, of rather closer texture than that commonly used for Orchidaceous plants. The pot should be well drained, in order that all superfluous water may pass off freely, otherwise the roots will perish. Like some other species of the genus, this requires an ample supply of water at all times; and the atmosphere to be kept as moist as possible, especially during the growing season. To prevent the leaves from being scorched, the house should be slightly shaded in sunny weather. In summer the temperature should never be allowed to rise much above 80° by day, nor to fall below 68° at night; but in winter it should never be raised higher than 64° by artificial means.—*Botanical Register.*

ERICA MURRAYANA Mr. Murray's Heath. (*Greenhouse Shrub.*) Ericaceæ. Octandria Monogynia.—This plant is another worthy result of experiment in the intermixture of properties. It was reared from seeds by Mr. A. Turnbull, of Bothwell Castle Gardens, near Hamilton, Scotland, and has been named by him after his friend Mr. Murray, of the Glasgow Botanic Garden. Mr. Turnbull favours us with the following:—"E. aristata minor being a dwarf compact grower, and E. vestita coccinea a rambling grower, my object in crossing them was, if possible, to get a variety with the dwarf habit of the former, and the brilliant flowers of the latter. With this view I impregnated E. aristata minor with the pollen of E. vestita coccinea, in the spring of 1837. The seeds ripened freely, and were sown in the autumn of the same year. A few of them vegetated the following spring (1838), and the remainder twelve months after. As I could not spare room for keeping them all, so soon as I could form some idea of their habits I destroyed all those that approximated most nearly to the male parent, reserving only six or eight of those that appeared most dwarf. Of these I bloomed four in the autumn and winter of 1842, three of them being very nearly the same in every respect as the specimen sent, while the other one is very different, being contracted at the mouth of the corolla, in the way of E. epistema. None of the plants exceeded eight inches in height when they bloomed, and I think they are likely to continue dwarf in their habit, while their general appearance will certainly bear a considerable resemblance to the Vestitas." E. Murrayana appears quite to have realised Mr. Turnbull's wishes; for its habit is very like that of E. aristata, and the flowers are as rich as those of the male parent. It is a most beautiful hybrid, and other similar ones, which we have received from Mr. Turnbull, are almost equally good. The specimens evinced the highest state of health, and Mr. T. cultivates his plants according to the well-known treatise of Mr. M'Nab.—*Paxton's Magazine of Botany.*

GARDEN MEMORANDA.

The Arboretum at Derby.—Amidst the benefactors of the human race, none stand more conspicuous than the late Joseph Strutt, Esq., who, with an effective liberality and determined kindness, was spared to commence, carry on, and complete the (emphatically speaking) garden of the poor. I visited this place on Sunday evening, the 21st of April last. The gardens open only in the afternoon. I observed a happy seriousness on the countenances of the visitors—a subdued enjoyment which spoke volumes in favour of the judgment of the noble-minded man who had thus provided the means of bringing the works of the Almighty under the eye of those who, all the week, are busily engaged in earning their daily bread. Parents, with their children of various ages, might be seen quietly sitting on the many substantial seats provided for them under the shade of trees, or strolling on the walks, admiring the early flowers on the shrubs; all the shrubs have a name attached to them, very conspicuous, yet not so as to be offensive to the fastidious eye. Bricks are made for the purpose; they are set on end, the upper angles being bevelled off. The name is painted on the angle and covered with glass, which keeps off the wet effectually; I only observed two in all the garden but what were as legible as the first day they were put down. It was amusing to see the children of ten years trying to read, no doubt to them hard names, and puzzling their little heads to make them out. I remarked the good behaviour of those "children of the poor," as amidst the many hundreds that were in the garden, I only observed one instance of rudeness, in two boys throwing stones at each other. It was instantly checked by the elder people, and the boys slunk away ashamed of their conduct. The garden was, as is generally known, laid out by the late Mr. Loudon, and the execution of his task does credit even to him. Broad substantial walks lead down the centre, branching off diagonally, and returning up each side in a serpentine form. They are hid from each other by raised mounds of various forms, sufficiently high to prevent persons seeing over. The named specimens stand singly on the Grass, at such a distance from each other as their various habits, as to size and form, will require when fully grown. They are, consequently, conspicuous objects, and draw attention even from the most heedless. In the ground, previously to its being laid out, there were some larger trees; these are judiciously preserved, and seats are placed under them. It is, I think, however, an oversight that these our common trees are not named. That the people pay attention to the names, was evident from the fact that the early flowering shrubs, such as Ribes, Prunus, &c., were crowded by even well-dressed elderly persons, who were reading the names, and, in some instances, copying them. I would just observe, *en passant*, that the labels contain the botanical name, English name, native country, and year of introduction. As a means of refining the manners, elevating the taste, and subduing evil propensities, giving the lower orders an innocent and rational amusement, and even instruction, the Derby Arboretum is much to be admired; I came away delighted at the good effect it produced even already. The garden is well kept; the walks were smooth and free from weeds, the Grass was short and of a good colour, and the beds were newly raked. Many of the Ribes are fine specimens, although the gardens have only been finished three years.—*T. A.*

Miscellaneous.

Mr. Fortune.—Letters dated Hong-Kong, Jan. 31, have been received by the Horticultural Society. At that time Mr. Fortune was well, and had lately arrived from Shanghae and other northern parts, with a considerable number of plants, a portion of which he was able to despatch by the Cornwall, a fine ship just about to sail. It is hoped that many valuable acquisitions will be the result of this first trip. Mr. Fortune had travelled far inland, visiting the gardens of the Mandarins, and generally receiving the greatest civility from the inhabitants. Nine glazed cases, a large number of seeds, and various objects of natural history, are now on their way to Europe.

The Deodar.—The largest plantation of this magnificent and useful tree, of which we have yet heard, is that

of William Ogilby, Esq., Secretary of the Zoological Society, who, on his estate of Altinachree, in Tyrone, has this spring planted *eleven acres*, the trees for which he raised from Himalayan seeds in the same manner as Larches are raised. Has any one heard the like of this?

Experiments on the Cultivation of Plants in Charcoal. By J. E. Teschemacher).—The first view I took of the value of charcoal in Horticulture, arose from the arguments on the different powers of well-rotted and of fresh manure: my prejudice, from constant practice, being rather in favour of the former. And one of my imaginary reasons for this prejudice (for proof was not to be expected), was that the carbon of the vegetable part of the old manure was reduced by fermentation and complete decomposition (combustion, Liebig) to the finest possible state of comminution, such as it is totally impossible to imitate by the most laborious mechanical pulverisation. In this finest of all states, carbon, if used at all by the living vegetable, could be most easily appropriated. My experiments were, therefore, all made with the finest pulverised wood charcoal I could procure, such as is used in making gunpowder:—1st. I planted a young, thrifty plant of Daphne odora in this charcoal altogether; in 12 months it was alive, the leaves quite yellow. On examining the roots they had not in the least increased or altered. I then repotted it in loam with one quarter charcoal, and watered with a very weak solution of nitrate of soda; in four weeks the leaves had become of a dark blackish green, and the plant was beginning to push vigorously. 2d. I planted a fine root of Fuchsia fulgens, with a stem, in charcoal alone. It immediately began to vegetate; the leaves were, however, extremely diminutive, and soon dropped off; the flowers appeared also diminutive, and finally dropped off likewise just after opening. It then, with the others, went to rest; but to my surprise, in August it again began to vegetate, and went precisely through the same process as in spring—others which were by its side remaining dormant; after this it went again to rest. 3d. I potted several seedling Camellias in one quarter charcoal, one quarter old manure, one half loam; these grew with great luxuriance, and the colour of the foliage was dark, healthy green. 4th. I potted several young Pelargoniums with various quantities of charcoal, never exceeding one quarter, often very much less. In these the effect was the same, both coming very near to the luxuriance and size of foliage of those treated with guano. In August last, I made up my mind to repot and top-dress a large number of exotic plants, of various kinds, many of which were in a bad state from neglect; of these the chief number were Camellias. I made up a compost, consisting of about two-thirds Roxbury fresh loam, and one-third a compost, chiefly consisting of old manure; to this I added about one-fortieth part of charcoal, and had the whole very carefully and intimately mixed; with this I operated. In September, when I thought the earth had got well settled round the roots, I began to water, every Saturday, with water in which guano had been mixed, in the quantity of about one ounce to ten gallons. I was perfectly astonished at the alteration which appeared in about four weeks, in the general health of all the plants—it seemed to me like magic; and many who visited the Public Conservatory, previous to the late calamitous fire, can bear testimony to their beauty and luxuriance. The earth of one large Camellia, (double white,) with about 250 blooms, was nearly altogether changed, the tub having fallen off with much of the earth. I hardly expected to save the blossoms, but they opened in as great splendour as the others. It seems to me that the period of the opening of the flowers was also generally accelerated. We had 20 or 30 out the first week in November, and the first week in December, just previous to the fire, I counted above 500 in full beauty; this was certainly earlier than we had them in previous years. Passiflora Loudoni, which, under the best of common cultivation, has always yellow and unhealthy-looking leaves, was placed in this mixture with the addition of charcoal drainage. The rapid change in its appearance was surprising, and although, from unavoidable circumstances, it was removed into this soil just previous to flowering, yet instead of being checked, fresh flower racemes shot forth, and, with the others, opened their beautiful blossoms in the greatest splendour; the foliage becoming of a fine healthy green and spread open, not curled in at the edges. I had several other experiments in progress on the use of charcoal, some of which I had hoped would have thrown light on its immediate action on the roots of plants—a subject on which we are at present in the dark; unfortunately, these with many others were destroyed by accidental fire. My impression from these trials is, that although charcoal alone is nearly useless, yet when mixed in due proportion with the earths and salts, usually found in soils and manures, its presence is highly beneficial, and greatly promotes the luxuriance of vegetation, as far as regards stems and leaves. Of its value in the production of flowers and seeds, I am not, for the reasons before stated, able to give an opinion of any worth. It may be thought, and probably is in part true, that much of the luxuriance of the last-named experiments arose from the use of guano water; but from other experiments with charcoal, instituted for the purpose of making comparisons with guano, and in which of course none was used, I cannot hesitate to believe that some portion of this luxuriance was also due to the charcoal.—*Hovey's Magazine of Horticulture.*

Trapsia gargonica.—M. Guyon brought some roots from Algiers, in the spring of 1843, for the Museum of Natural History. He states that the root possesses strong purgative properties, and that it is much used among the Arab tribes, and likewise in the interior of the Mazabite country, south-east of Algeria. This very fine umbelliferous plant, it appears, has been long in the collection of the Museum of Natural History. Its roots are white, large, and tapering, often extending to a depth of more than three feet in light soil. Its leaves are divided, erect, and shining; but it suffers from the cold of severe winters, consequently against such it requires protection. The young plants should be kept in an Orangery or greenhouse. — *Revue Horticole*, 1843, p. 327. ‖ [This is supposed to be the silphion of the ancients].

Hydrangea Japonica.—It has been stated that the Hydrangea japonica has produced seed, an advantage not afforded by the Hydrangea hortensis, which it was also hoped this new shrub would surpass in beauty. This hope has not, however, been realised. The finest plants of Hydrangea japonica which have been seen in flower, are very inferior to the one which has embellished our gardens for more than 40 years. It now remains a question whether finer flowering plants may be obtained from seed. It appears to form a bush of considerable size.—*Revue Horticole*, 1843, p. 327. ‖

Abstract of Tables kept by W. Wyatt, Esq., showing the Highest, Lowest, and Mean Temperature, &c. &c., in Adelaide, South Australia, for the year ending 31st October, 1842.

—*From the Tasmanian Journal.*

The Franconia Raspberry.—(See p. 103, 1844.)—This shrub has been cultivated in this place for several years; the first winter they were covered; the second year one half of the plants only were protected. Those left exposed to the winter bore as well, if not better, than the protected ones, and appeared in perfect health the summer following. This year the bed contains about 1000 stems, after pruning out; every one in sound condition, and wholly exposed to the winter, which has been a very trying one. Other beds, in different locations, were left unprotected the past winter, and have proved perfectly hardy. If it is unnecessary to protect them, there is a saving of labour spring and autumn, seasons of the year when gardeners are very busy. Any one in the country cultivating them by thousands, can the next winter leave a part, in an exposed situation, unprotected, and prove the thing, sending you the result for publication. It may be that the protection afforded by houses in the city may be sufficient, and the plant be killed in the open field. They also force well. I tried a few pots of them in the greenhouse last winter, with different treatment. The result was in favour of those grown in the greatest heat, with a dry atmosphere, and watered with carbonate of ammonia, in the proportion of 300 parts water to one of ammonia; next, those watered with liquid manure; and last, those watered, simply, which were nearly a total failure, the fruit not swelling off. They were taken up with a ball of earth, before severe frost, and all put in same sized pots, with as much rich soil as could be added. —*Hovey's Magazine.*

CALENDAR OF OPERATIONS

For the ensuing Week.

I.—HOTHOUSE, CONSERVATORIES, &c.

Many stove plants would do better in an intermediate house from this time until the end of August, where they would get less confinement than in a regular stove. For want of such a house, gardeners often make use of Vineries, &c. for this purpose, and distribute their stove plants in summer through the different forcing-houses; and, if only for the benefit of finishing and ripening their growth, without being crowded, this is a good plan. Air, moisture, and cleanliness are now such matters of course, that I need not insist on them.

Conservatory.—It may be useful to know that the Echites suberecta, and Alamanda cathartica graft freely on the Beaumontia grandiflora; and these two beautiful stove-climbers may therefore be got to flower in a conservatory with a fixed roof, as the Beaumontia is hardy enough to live in a common greenhouse, if it is planted out in the borders. The Beaumontia itself, however, is one of our very finest climbers. One in the conservatory here has just begun to flower, and will probably continue to do so until August. It has a greater multitude of blossom-buds on it than many would imagine. In the hurry of watering it often happens that the centre of the balls of large specimen plants, Orange-trees, &c., get very dry, the water finding its way down near the outside, where the soil is looser. Gardeners on the Continent make a provision against this, which we seldom see done in this country. They scoop out a little of the soil round the stem, and raise it towards the edge of the pot, or tub, thus forming a shallow basin, so that a large portion of the water passes down the centre. In summer, this is a good plan for many plants; and in winter, the surface could be levelled over in the usual way.

Greenhouse.—Be in no hurry to turn out of doors fine greenhouse plants; but all coarse and common things, and many soft-wooded plants, whose tops may be considered, in a manner, to be annual, may be turned out any time about the end of spring; and the finer portion of the plants will by this means have all the room, air, and light to themselves. Of all plants, those in the greenhouse are most apt to get too dry in summer; and therefore, besides the regular watering, they may be well syringed every afternoon, in such fine weather as we have had this season.—*D. B.*

II.—FLOWER GARDEN AND SHRUBBERIES.

Out door Department.—Since I last wrote, multitudes of tender plants have doubtless been planted out, and as the weather is as ungenial as it can be for such operations, nothing but assiduous attention to watering and shading can give them a chance of success. The importance of properly mulching the beds cannot be too much insisted upon, and where it is inconvenient to use short Grass because of its untidy appearance, the beds should be surfaced an inch thick with leaf-mould, or fresh light soil, or where neither can be used hoe the beds over so as to form a loose surface. The soil in the American beds here, which was mulched with short Grass two months back, is in the finest condition imaginable, though we have not had any rain for the last 47 days—a proof that mulching is calculated to effect considerable good, for had these beds not been mulched they must have been watered repeatedly to have kept the plants alive. Mulching is advantageous not only from saving labour, but also, where cold spring-water has to be used, from preventing the soil from being unnaturally cooled, by the frequent application of water from a cold medium. The indispensability of using water, as warm or even warmer than the soil, is well known to practical men; and a few experiments will soon satisfy the amateur of its advantage. After planting out your beds make a reserve of a few plants of each kind to fill up gaps, and also, if you fill any beds with Annuals, reserve some plants in pots to replace them as soon as they get shabby. Last year, after planting the beds, I had some small scarlet Pelargoniums left on hand; these stood about in a half-starved condition in small pots until the end of July, when they were potted into 24s and the bloom buds taken off. They began blooming in November, and were in bloom in the temperature of the greenhouse throughout the winter.

Rosery.—The "worm i' the bud" is making considerable havoc in some gardens. Look carefully over the plants, and destroy them between the finger and thumb; at the same time, you may also regulate the growth of the plants where necessary. The Cloth of Gold Rose is a very vigorous grower, and, like some of the other Noisette varieties, will probably grow to the length of 10 or 15 feet before it blooms.—*W. P. A.*

III.—FLORISTS' FLOWERS.

Auriculas.—Seedlings may now be pricked out into pans or boxes, of leaf-soil and sand, at regular distances, keeping them in a closed frame for a few days, till they have got fresh root, when they may be placed in the shade, and protected from drenching rains. *Tulips*—still continue to be the centre of attraction. The reports from various quarters describe the bloom as generally good, but those which miss flowering are very numerous. Bees are apt to get inside the flowers disturbing the farina. The careful florist, with a Camel hair brush, will remove it, so that the purity of the cup may be apparent. *Ranunculuses* — Are growing fast, but are in much want of rain. If they have been top dressed with very rotten manure, as previously recommended, they will in some measure have escaped the effects of the drought, which has been detrimental to many. *Carnations.*—As these continue to grow, keep them regularly tied up to their flowering stakes; the pots must also be well attended to; all weeds must be removed, and the plants top-dressed. *Pinks.*—Continue to remove exuberant shoots, and train the buds, removing those which are small or malformed. Both Pinks and Carnations are now much infested with insects; these must be carefully brushed off; avoid bruising them on the bud or stem of the plant, as it appears to have a prejudicial effect. *Dahlias*—May now be planted out with safety.—*T. F. W.*

IV.—PINERIES, VINERIES, &c.

Pinery.—Do not let the bottom-heat of the plants intended for fruiting in the autumn fall below 85°. Let the watering be attended to with the utmost regularity, or the present hot weather will be likely to throw some of the plants into fruit prematurely. On the other hand, if you wish to induce any of the plants to fruit sooner than they appear likely to do with regular treatment, it may be done by withholding water; but it will be at the expense of size and quality. It is an excellent plan, where practicable, to let the stools from which fruit has been cut remain in the house for some time, and to supply them liberally with liquid manure, in order to encourage the growth of the suckers.

Vineries.—As soon as the Grapes are cleared from any of the rafters in the early house, let the foliage be well washed with the syringe, and repeat this twice a week, till the leaves begin to change colour. Vines planted inside the house must be kept well supplied with water. In the succession-houses, thin the bunches, stop laterals, and use the syringe freely in the afternoons. To those who are about to plant Vines for early forcing, I would confidently recommend the Muscat Muscadine, as one of the best kinds, combining the flavour of the Muscat with the good forcing properties of the Muscadine. It also succeeds well in pots.

Peach Houses.—Although a dry atmosphere is required for giving flavour to Peaches and Nectarines, it is not well to withhold water from the roots, while the trees are in the midst of their growth. Water the inside borders freely with liquid manure. I find guano-water to suit them remarkably well. Let the watering be done in the morning, and in clear weather, as vapour is prejudicial to the ripening fruit. The outside borders also should be watered as far as the roots extend; and if they are afterwards mulched, it will be a great saving of labour during hot, dry weather.

Fig house.—See former Calendars.

Cherry-house.—Attend carefully to the trees from which the crop has been gathered, till the wood is perfectly matured. Watering at the roots, syringing frequently, and giving plenty of air both front and back of the house, will be the principal things to attend to for several weeks.

Strawberries.—Encourage, by watering and mulching round the old plants with decayed manure or leaf mould, the growth of the Strawberry runners intended for forcing next year; as success depends in a great measure on obtaining strong plants. Any spare lights and frames may now be usefully employed, in forwarding part of the crop of Strawberries out of doors, to succeed those in the houses or pits.

Melons.—As it is not necessary that Melons intended for preserving should be of large size, to thin them much will not be required. Endeavour to preserve the foliage of the early Melons clean and healthy, and they will produce a second crop. Plant out for succession in frames where Potatoes have been forced. Let the soil be good, and 18 inches or 2 feet deep; and procure, by means of linings, a bottom-heat of about 80° to start the plants.—*G. F.*

V.—HARDY FRUIT AND KITCHEN-GARDEN.

Pear and Apple-trees, &c., on Walls.—There is generally so much to do in other departments at present, that Pears, &c., on walls are apt to be neglected. How else can we account for the unsightly hedge-like appearance, which in a short time they will generally present; or for the different theories respecting their summer management, put forth by men of great success and experience—theories which seem sometimes to be based upon a desire to erect a plan the apology for the exhibition of the admitted unsightliness. Many imagine a Pear-tree would be ruined if its shoots were removed before they became sufficiently ripened, so as to prevent any of the buds left in the base of the shoot from starving. In such a case the buds left have had little opportunity of concentrating for themselves the elaborated juices; the fruit is often injured by the simultaneous removal of shoots, that previously shaded it from the sun; the relative action going on between the root and the top receives a sudden check, but a check seldom to the benefit of the cultivator, as already there will be a sufficiency of crude sap in the branches and roots, to cause those buds left at the base of the shoots to break again into shoots next season; instead of those desirable small spurs, the precursors of fruit-buds. Others again with more reason and science advocate the partial breaking of the shoots, so that they may be placed in a pendent position, contending that thus the buds intended to be left are not unnecessarily shaded, and that no sudden check is given. But even in this case, the buds left at the base of the shoot will seldom become fruit-buds, until after another summer's maturation; while the pendent shoots shade from the

influence of light those leaves upon the small spurs, from which you expect to obtain fruit-buds next season. The existence of a mass of breastwood indicates that the plant commands more nourishment such as it is, than the circumstances in which it is placed will enable it to appropriate to fruitful purposes. In checking this luxuriance, would it not be a preferable method to limit at once the pump-handle action of the shoots upon the root-suckers, by pinching out their points when from four to six inches in length? It will require to be repeated during the season, but there will be no danger of the lower buds breaking, no sudden check will be given to the system, no unnecessary shade afforded to those parts which ought to be fully exposed, and if persevered in, and the tree is otherwise favourably situated, there will be little occasion for resorting to the modern panacea for most fruit tree ills—root pruning. It must be adopted with caution in the case of weak trees and those new sorts which bear freely, and chiefly on the two or three years old wood.

Cucumbers—Vegetable Marrow.—Prepare for getting these planted out, forming beds of short Grass, refuse from Sea-kale beds, &c., or any other littery rubbish. *Routine.*—The same as formerly. I almost envy those who write about flooding the ground before planting, as water is water here. Cauliflowers, &c., are thriving, however, with the protection of short Grass.—*R. F.*

VI.—ARBORICULTURE.

Old Woods.—Proceed as speedily as possible with the felling, peeling, drying, and housing, or stacking of Bark, while weather is favourable; and clear away all branches, timber, &c., as soon as possible.

Coppice.—The foregoing observations apply to Coppice woods, when felling and peeling is going forward. Attend to the directions given last week.

Young Plantations.—The directions given in last Number should be attended to, and followed up regularly. It is of the greatest advantage to proprietors of plantations to see that these things are done properly.

Nursery Work.—As the weather continues dry and sunny, constant attention to young seedlings in beds, or transplanted ones in rows, is necessary, and to thinly planted trees of all kinds; weed, water, shade, and fasten them firmly from wind waving, &c.; and put in practice the directions given last week regarding the training of young plants in nurseries.—*W. B.*

State of the Weather near London for the week ending May 16, 1844, as observed at the Horticultural Garden, Chiswick.

May 10 Overcast, partially clouded, and fine, clear at night
11 Very fine throughout; densely overcast at night
12 Overcast; very fine; clear
13 Very fine; dry and sultry; clear at night
14 Very fine throughout, uniformly overcast at at night
15 Fine, with light clouds, brisk N.E. wind, clear and cool
16 Light clouds; very dark air; overcast at night
Mean temperature of the week, 2 deg. above the average.

State of the Weather at Chiswick during the last 18 years, for the ensuing Week ending May 25, 1844.

May	Aver. Highest Temp.	Aver. Lowest Temp.	Mean Temp	No. of Years in which it Rained.	Greatest quantity of Rain.	Prevailing Winds. N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.

Sat. 25	66.1	45.6	55 9	6	0.64	1	2	—	1	1	4	3	—

The highest temperature during the above period occurred on the 25th, 1833—therm. 82°; and the lowest on the 25th, 1839—therm. 29°.

Notices to Correspondents.

APPLE PIPS.—*F.*—These should be treated in the same way as the Gooseberry seeds mentioned below: probably the reason why the seed failed is, by keeping it dry during winter in paper. The seed should either be preserved in the fruit or in dry sand during the winter, otherwise it becomes mouldy and soon perishes. ¶

BOOKS.—*M. G.*—The division of "Mackintosh's Practical Gardener," relating to Conservatories.

BOX-EDGINGS.—*A Subscriber.*—You had better lift your Box-edging that is 1 ft. high, and replant it with fresh box, which will form a better edging than if the old Box was cut down.‡

DISEASES.—*A. B.*—The cause of white variegation in leaves is unknown. It is often unaccompanied by ill health. Probably the appearance in your Rhododendron will be removed by a good dressing of cowdung, and being fully exposed to light in a warm greenhouse. Treat Azalea Smithii in the same way.—*Vitis* and *J. T.*—The production on Vine leaves is a diseased state of the cells of the under surface, immediately beneath the cuticle, which become much elongated and multiplied, with a vertical arrangement, the cuticle being sometimes wholly, sometimes only partially obliterated. We do not observe any trace of an acarus, as is the case in a similar production on the leaves of the Pear and mountain Ash. The leaf is evidently discoloured and withered in consequence of the absorption of the neighbouring chlorophyll by the diseased and multiplied cells. It is very difficult, if not impossible, in the present state of our knowledge of the diseases of plants, to say what is the cause, and consequently to assign a remedy. The whole leaf, whether sound or diseased, abounds in raphides, perhaps more than is usually the case; at least, more than in a leaf plucked for comparison. Though so strongly resembling one of the epiphyllous fungi outwardly, it is of an entirely different nature.—*M. J. B.*

FLOWER-DRAWING.—*A Subscriber.*—If your daughter knows how to draw other things, she may acquire the art of drawing plants, provided she will study attentively their exact structure, and attend to the minutiæ of the matter. But it cannot be done well except by those well acquainted with Vegetable organisation. We have some thoughts of giving a series of articles on the subject. Almost all flower-drawings are miserable things. Lindley's "Introduction to Botany," or his "Elements of Botany," will teach as much as books can teach, which are not written with a special view to flower-drawing.

GOOSEBERRY SEEDS.—*F.*—Sow these as soon as possible, in pots filled with a light sandy loam, and place them in a shady situation. The proper time to have sown the seed would have been about the end of February: it will probably not vegetate now before next spring. The seeds should be preserved in sand during winter, otherwise they become dry, and frequently will not vegetate for twelve months after sowing. ¶

HEATING.—*G. C.*—The very circumstance you name of brick tanks, lined with cement, losing 24 gallons of water a day, is a proof of their excellence for bottom-heating. Flues may be built brick on edge, and covered with a flat tile. Cover your back roof with either glass or calico. The nearer the ground you can get your flue the better. It cannot be too low to be above ground. A common foot flue will do perfectly well. There is no reason that we see why the ascending flue should not be in the back wall; you may put a damper in it in any convenient place. You cannot cement an iron boiler to a wooden tank, but must employ a union joint. Let your tank be 3 feet wide, and 6 inches deep; or 9 inches if it suits you; for the larger the body of water the better for the purpose of propagation.

HORSEPOND.—*Tom Muddy.*—Use the charcoal in small pieces, such as are unfit for fuel; it does not matter whether dust or small fragments. No doubt a good deal will be necessary to produce an effect; but it will be valuable manure afterwards. If, however, you can get the offensive water on idle land, it will benefit that land, and soon cease to smell. The detestable odour is its most useful part, if you can but get it absorbed by earth, or other substances. Cinder-siftings, small coal, peat, all act something like charcoal. It is very difficult for us to give the best advice concerning these matters, without actual inspection, which is impossible.

INSECTS.—We wish we could impress upon correspondents the utility of securing specimens from the pressure of the Post-bag, by inclosing small objects in QUILLS, *well stopped with cork*, and larger ones in *flat boxes*. It is often very desirable to breed the insects transmitted. It is a mere waste of money and time to send Ruricola leaves dried up, and beetles and flies reduced to powder. As our great objects are to communicate information beneficial to the cultivator, and to obtain data for the advancement of science, we must beg as a favour that this request may be attended to.——*A Constant Reader.*—The greatest benefit has been derived from dusting the Gooseberry-trees with hellebore-powder; but if hand picking be resorted to in good time, and be persevered in, it is a certain remedy. *R.*——*A Lady Subscriber.*—The animal is a snake-millipede, called Julus terrestris (?) It is believed to injure the roots of plants. *R.*——*Devoniensis.*—I do not remember to have seen Rose-buds affected as yours are; but the specimen was so much crushed, that it is impossible to form any opinion concerning the disease. Soap-suds and Tobacco-water make an excellent wash for the aphis, but fumigation is better where it can be applied. *R.*——*W. P.* is referred to the advice already given to "A Constant Reader." *R.*——*G. S. Winkle* is correct in attributing the destruction of his Raspberries to the weevils transmitted. They are named Curculio picipes; he will find their economy given in the 1st Volume of this Journal, p. 292. The best mode of destroying them is to shake the bushes over sieves *by night*, when they are feeding, by which means vast numbers have been collected. *R.*——*Iquotus.*—Your Pear-leaves seem to be diseased by some fungus, but the brown spots are caused by a Caterpillar, whose history was given in the 1st Volume of this Journal, p. 261; it will produce a beautiful little Moth, called Argyiomiges Clerckella. The most effectual means of stopping its ravages, is to pick off all the spotted leaves and burn them; at the same time the earth at the base of the trees, or of the walls against which they stand, should be stirred a few inches deep, and lime-water or liquid manure poured down to destroy the pupæ. *R.*——*X. Y.*—If you will transmit us, in a box well protected, specimens of the caterpillars or grubs infesting your Gooseberries and Apple-trees, we will with pleasure answer your queries; but without such materials it is out of our power to do so. *R.*

LIME-WATER.—Z.—One pound of lime will dissolve in about 100 gallons of water. But it is nonsense to apply exact chemical proportions to rough operations with the cheapest of all materials.

MANURES.—*A. B.*—Camellias like a rich loam, abundantly manured. Guano and cow urine have been found to work wonders, especially if one-eighth of fine charcoal-dust be added to the soil. Potter's guano seems to suit everything. ——Z.—Horse-droppings are of little value. There are no proportions worth mentioning for such mixtures as liquid manure. Everybody exercises his own judgment. The stronger the fluid, of course the less is used and *vice versâ*. Instead of applying to druggists for superphosphate and such articles, you should inquire of the advertisers in our columns.

MARTYNIA FRAGRANS.—*Andover.*—If Balsams are well managed, the same treatment that suits them will also suit this; but it is one of those plants with which nothing can be done except the house is damp as well as warm. It requires a rich soil and frequent potting; it should also be well attended to with water.‡

MORPHOLOGY.—*G. J. T.*—You are perfectly right. If you fertilise the pistil of a double flower with the pollen of a single one, the seeds will be more likely to produce double flowers than seeds raised from single ones.

NAMES OF PLANTS.—*J. C. L.*—Maxillarias cannot be determined by single flowers; the leaves are requisite. This seems to be M. platypetula. The Oncidium is bifolium.——*W. T.*—Asplenium Adiantum nigrum.‡——*W. D. T.*—Isatis tinctoria; probably Ribes petræum. It is worthless as a currant.‡——*A Subscriber.*—Doronicum Pardalianches.——*Flora.*—Lunaria biennis.——*Eliza.*—Kennedya rubicunda, Erica togata.——*J. D.*—1, Pteris longifolia; 2, Aspidium pectinatum; 3, Pteris hastata; 4, Serissa fœtida.§——*M. A. G.*—1, Indigofera australis, var. gracilis; 2, Saxifraga granulata plena; 3, Erysimum Perowskianum; 4, Gnidia juniperifolia; 5, Pimelea decussata.§——*A. B.*—1, Indigofera australis; 2, Goodia pubescens; 3, Leptospermum juniperinum; 4, Cytisus albus; 5, Acacia verticiliata; 6, A. tristis.§——*H. A.*—1, Shepherdia canadensis; 2, S. argentea; 3, Lonicera villosa; 4, Cynoglossum; 5, Hamamelis virginica; 6, Acer tataricum.§——*Cupio Discere.*—1, Amelanchier ovalis; 2, Amygdalus pumila; 3, Andromeda calyculata; 4, Amelanchier vulgaris; 5, Salix cordata (?); 6, 7, 8 are so small specimens, that no one can tell what they are.§——*W. R. M.*—Coronilla Emerus.§——*W.*—1, Epidendrum selligerum; 2, Bletia hyacinthina; 3, Bletia sp.; 4 and 5, Oncidium Carthaginense; 6, Pentstemon, too much dried up for any one to know what species; 7, Carex ovalis; 8, C. sylvatica; 9, C. præcox.§——*J. G.*—1, too small a specimen for any one to know it; 2, Nemophila insignis var., inferior to the common sort; 3, Spiræa lævigata.§——*Annandale.*—A. Smilax, very like S. glabra.——*Este.*—Rosa rubella, apparently.——*P. C.*—Reticularia atra, Fr., a species which has hitherto been very rarely noticed in Great Britain. It is the Lycoperdon fuliginosum of Sowerby, who found it on floating deals in the Thames, near Battersea. It is very well figured by Albertini and Schweinitz. *M. J. B.*

OAK GALLS.—*Rural Ch.*—You have inclosed *nothing*. Gall nuts are mentioned at p. 170 of Lindley's "Natural System." Kermes are insects, and have nothing to do with Botany.

ORCHIDACEÆ.—*C. F. S.*—The woods around Bahia abound in Orchidaceæ. Little is known of them; but Epidendrum cinnabarinum, Catasetum Hookeri, Cattleya Loddigesii, and Oncidium ramosum are rare and fine species to be met with there.

PANSIES.—*S. M. H.*—A perfect bloom of a Pansy should be circular in form, the petals individually large, with even edges, and of considerable substance; the side petals should meet above the eye, and the eye be distinctly marked; the ground-colour uniform, and the marking or belting should be uniform also.*

PELARGONIUMS.—*J. N. J.*—The following 12 varieties will much improve your collection:—Matilda, Coronation, Annette, Privy King, Hodge's Commodore, Queen of the Fairies, Rhoda, Nestor, Gaines's Rising Sun, Grand Monarque, Madeleine, and Garth's Witch.*

TRANSPARENT CALICO.—*J. R. L.*—If you can prevent your birds from picking and tearing this material, you may employ it for an aviary; but we should think it very unsuitable. Remember that you cannot see through it. If, however, your object is to give them some protection from cold, it might be used on the outside of the wires.

TREES.—*A Constant Reader.*—Had you not better look about you, and see what common trees and shrubs succeed best in your neighbourhood? To give you a complete list would be to print a catalogue. Besides, you give neither soil nor climate. Of course, Yews and Hollies must be employed in connexion with the style of an old English mansion. Indeed, for such a place, the common wild trees should be employed in preference to exotics, if they are to be in keeping with the architecture.

VERBENAS.—*B—g.*—The only yellow Verbena with which we are acquainted, is an old variety named *sulphurea.**

WOODEN ROOFS.—*Hibernicus.*—If boards are *nailed* upon a wooden roof, all the pitching in the world will not prevent their splitting by the action of the sun. Wooden roofs should be made with loose boards, placed crosswise, not lengthwise, and secured by fixed rebates, which house in the joints. Your best way would now be to cover it with Croggon's Asphalte felt, which is excellent for such a purpose.

MISCELLANEOUS.—*X. Y. Z.*—We never give prices. As to gas-water, its value varies from place to place. We must refer you to previous Numbers for the manner of using it.——*Nhoi.*—Water that has been standing over tar (not gas-tar), is not likely to be injurious to plants; but we should not anticipate any advantage from its use.——*J. B., Kew.*—The Botanic Gardens at Kew are open to the public *gratis* every day after one o'clock.‡——*Maria.*—You may cut the first Grass on your lawn when it is about 6 inches high.‡——*B. g.*—Much obliged; but the Numbers would be useless.——*S. M. A.* will find a list of plants suitable for rockwork given at p. 152 of this year.‡——*Felix.*—You must excuse us. We cannot undertake to teach Latin, or to discuss the goodness of such as botanists employ. With them it is, in some respects, a conventional language, and necessarily so. There is no inaccuracy in the instances you mention, and we cannot understand your meaning. Jussieu's "Genera Plantarum" is written in good Latin.——*Sambucus.*—Your variety of the Elder is a most beautiful variegation. We never saw one so handsome. From what you say, we should expect the variety to be permanent. Let the wood ripen before you take cuttings from it, unless you prefer the half ripe wood of mid-summer.——*A Beginner.*—Your Pelargoniums that are in too small pots may be shifted now. If you find book-muslin too weak, you may use calico for your purpose.‡——*W. D. T.*—Ribes aureum and sanguineum produce fruit in the neighbourhood of London; but it is not esteemed.‡——*A Subscriber.*—A scythe should last one season, at least.‡——*E. C.* may remove Laurustinus about the beginning of November.‡——*M.*—Cinerarias are occasionally sweetscented.*

SEEDLING FLORISTS' FLOWERS.

CALCEOLARIAS.—*J. W.*—Nos. 1 and 2 are not at all uncommon; 3, light buff ground, covered with maroon blotches, is a good variety; 4 is pretty, but no novelty. In packing them for post, damp blotting-paper should be placed over the flowers before you apply the cotton-wool. *——*G. S.*—Nos. 1 and 2 are not novel; sorts similar, but stronger in the marking, have already been sent out. So many of these flowers are annually raised, that it requires some decided novelty in colour or marking to make them worthy attention; we like the Selfs best in your collection, being bright and clear colours. *——*H. G. W.*—Nos. 1 and 5 are worthless; 4, pretty, but not good in form; 2 wants more of the yellow seen; 3 is the best flower, but similar sorts are now not uncommon. *——*W. P.*—*Delicata* is your best seedling, but they are none of them equal to the present race of flowers; *Cardinal Wolsey* is large, but the blotch is too blurred and undecided. *——*Z. Z. Z.*—Great numbers are raised similar to *Unique*; *Majestica* is large and delicate, and forms a pretty variety; but this is also similar to other varieties we have seen. *——*T. L. T.*—No. 151, spotted varieties are now not uncommon, and they require to be large and well formed; your specimen is much too small; all the others have the same fault, and they are no improvement upon seedlings raised years since. *

CINERARIAS.—*Y.*—Your seedling is rather narrow in the petals, but good in size, and very beautiful in colour.*——*A Constant Reader.*—The seedling sent is pretty in colour, but the petals too narrow, and wanting substance.*——*G. S.*—Your white seedling with purple disk, is decidedly the best white we have seen.*——*A. S.*—Your seedling, a rich and brilliant deep blue, with black disk, is a very beautiful variety.* ——*J. B.*—*Carminata* is a rich coloured variety, better than either of the old varieties sent with it. *Mertonia* is a very pleasing colour, large and good; a single pip of each is not sufficient to form an opinion from. No. 3 we could not find.* ——*J. H. Elmhurst.*—Neither of your crimson varieties have any qualities to distinguish them from a great many other varieties of similar colour. The white one tipped with delicate blue is a pleasing variety.*

FUCHSIAS.—*S. S. J.*—*Favourite* is a very good flower; tube and sepals stout, of a rich rosy scarlet; with stout corolla, of a crimson purple.*

PANSIES.—*Z A.*—No. 1, a fine large flower, of great substance; eye large and fine, lip large, and side-petals meet well above the eye, joining the belting, which is broad, of a deep purple, upon a yellow ground. No. 2, same in form as No. 1, three degrees lighter in colour, the petals not of so great a substance, and where the belting joins the ground-colour it is not so decided. No. 3, pretty, but not so good as the last. No. 1 is a very fine variety.*——*L. and D.*—*General Pollock* is a flower of good form, great substance and firmness, white ground, eye deep blue, with darker lines; belting, deep blue in the centre, gradually becoming lighter and brighter each way; top petals blue purple; there is a slight degree of roughness on the edges of the lower petals in the specimen sent.*—— *Y.*—*Helen* is very pretty in colour; but we doubt the constancy of the flowers. *Titian* fails in the ground-colour, and wants substance. *Patroclus*, very large, but wants form and compactness. *Harry* is a fine bright flower, of good substance, bright yellow ground, belting joining well above the eye, broad, and with top petals of a deep rich velvety purple. *Sulphurea superba*—of no use.*——*J. L. H.*—No. 1, a large and well-formed flower, of a deep mulberry colour, having a small centre, occasioned by the breadth of the belting. No. 2, a large flower, of good form, novel, blue belting, rather too faint. No. 3, very large, petals meet well above the eye, ground colour a bright pale yellow, eye fine, belting and upper petals of a very deep rich velvety purple, joins the ground-colour with a decided edge—a fine flower, of peculiar brightness. No. 4, fine eye, deep yellow ground, upper petals and broad belting of the same; wants a little more substance. No. 5 was rather too much gone. No. 6, a flower novel in appearance, the eye being a lighter blue than usual, very little deeper than the margin; large and well formed; rather defective where the side-petals should meet above the eye. No. 7 wants the dark eye. No. 8, with a fine eye, has a slight variation in the ground-colour between the lip and side petals. These are a fine set of flowers, large, with the petals in fine proportion, the side-petals generally meeting well above the eye.*

PELARGONIUMS.—*Anon.*—*Flora* is a flower of good form, rather too veiny in the under petals, and requiring a white centre to relieve the flower from a monotonous appearance.*——*S. W.*—*Beauty of Kilperton*: a large, delicate, and showy flower; trusses large; the upper petals are rather crumpled, and too veiny.*

PETUNIAS.—*V. W. X.*—Your pencilled varieties are the best; and of these No. 6 appears to be the most decided; and No. 16, a rich purple of a peculiar tint, with dark throat, is worth preserving. Nos. 2 and 3 are common; these flowers alter so much after being cut and placed in water, that it is difficult to decide upon their particular tint.*

VERBENAS.—*J. H., Elmhurst.*—Both your specimens are good varieties; the flowers are large, and they expand well.*

ERRATUM.—In the article on "Potting," by T. Moore, in last week's Paper, p. 296, col. a., line 48, instead of "it is on soil," read "it is an evil."

AGRICULTURAL COLLEGE, &c.—At a Meeting of the Committee, held the 6th May, 1844—Earl Bathurst in the Chair, Resolved, "That having determined on applying for a Royal Charter, to limit the responsibility, and also the profit of shareholders, it is desirable to fix on a site for the Institution. The Committee therefore invite Tenders of Farms, of from 300 to 600 acres, addressed to the Secretary."—Signed, by order of the Committee, ROBT. J. BROWN, Hon. Sec.
Cirencester, 17th May, 1844.

The Agricultural Gazette.

SATURDAY, MAY 18, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

Wednesday, May 22 Agricultural Society of England.
Thursday, May 23 Agricultural Imp. Soc. of Ireland.
Wednesday, May 29 Agricultural Society of England.
Thursday, May 30 Agricultural Imp. Soc. of Ireland.

FARMERS' CLUBS.

May 25 { Gloucester. Cardiff.
May 27 { Chepstow. Wenlock. Fairford.
May 28 Rayleigh.
May 30 Richmondshire.
May 31 { Stoke Ferry. Hadleigh. Wrentham. Debenham.
June 1 Collumpton.

We do not intend to detail the facts, experiments, and arguments, which induce those who study the subject to believe that much of the solid matter, the carbon of vegetables, enters them through their leaves from the air, as well as through their roots from the soil. We allude to the subject generally, because it explains the advantages which are derived from many Agricultural operations, and more especially because it so clearly explains the benefit which, as many farmers know from experience, often follows the practice of MOWING YOUNG WHEAT at this season of the year.

The food which plants absorb by means of their leaves from the air is contained in a gas existing there, called *carbonic acid*—so called, because it is known to be composed of carbon, the substance of wood, and of oxygen, the life-giving element of the atmosphere. Now, it has been ascertained that under the influence of solar light, plants absorb this carbonic acid gas, and decomposing it in their leaves retain the carbon and exhale the oxygen. Light is the agent in this process; on whatever part of a vegetable it falls, there it effects a decomposition of this gas, causing a deposition of carbon, the basis of *wood*. Its tendency is thus to convert an herbaceous into a woody substance. Deprive a plant of light, and, to speak technically, you blanch it; it becomes soft, juicy, colourless; give light free access to it, and it hardens, assumes a colour, and in fact becomes woody.

Now, at this season of the year, on our best Wheat lands, the plants, owing to the luxuriance of their growth, completely hide the ground; this, in dry weather, such as we have at present, is certainly an advantage, but the foliage of the Wheat plant, where it has grown luxuriantly, hides not only the ground but also the stem of the plant. After a shower at this season, when every leaf is bowing under the weight of rain-water, look towards the sun at a promising field of Wheat, and you will see its light reflected towards you in an unbroken sheet; none of it can find access to the lower parts of the plants—the leaves get it all to themselves, and as a natural consequence, they grow most luxuriantly, increasing in number, length, and breadth, until, with the load of water which the weather sometimes lays upon them, they ultimately become too heavy for the weak herbaceous stalks below them, and the plants are laid flat on the ground, to the great injury of the crop.

The remedy for this, as farmers well know, is to mow these broad leaves off. There is no chance as yet, with ordinary care, of injuring the young ear; its position in the plant may be easily ascertained by dissection, and except where the crop is very forward, it is still very near the ground. The leaves should be cut as high as possible, and for this purpose the scythe must be very sharp. The Grass cut off should be allowed to remain where it falls: it will soon wither and disappear.

Why is this process beneficial? The practical man will say that the plant is thus relieved from the weight of leaf above it, and also from the load of water which it carried, and which bowed it to the ground. Doubtless, the plant does derive an immediate advantage from the process in this respect; but this is a very meagre answer to our question. The true answer depends upon that chemical process in which, as we have said, light is an agent. The leaf of the plant being cut off, light has access to the stalk, and renders woody that which before was soft and herbaceous. The stem of the Wheat-plant thus hardens, and becomes strong and able to bear the weight of leaf and ear in a future stage of its growth. And, unquestionably, upon the strength of the stem the ultimate productiveness of the crop in a great measure depends.

Now, what good can be derived from the perusal of these observations? No plan has been suggested which ordinary common-sense, under the circumstances, would not at once indicate, and the advantage of which experience has not long ago confirmed. Nay, here is a case in which a practical man, who may be prejudiced against, as he thinks them, the officious suggestions of scientific men, may fancy that he has full scope for his sarcasm. "Well! after all your laboured efforts, after invoking all the aids of Chemistry and Vegetable Physiology, you have got no farther than the stage to which I, and my predecessors for generations back, had long ago attained. You have elicited nothing new—you have suggested nothing by which I can hope to *profit*—you have but confirmed me in the opinion that farmers must put their own shoulders to the wheel as heretofore, and not stand calling on science, theory, or Jupiter, for assistance."

Let us, nevertheless, simply state a useful inference, which may fairly be drawn from what has been said, to impress the truth of which upon our readers these remarks have, in fact, been made.

Here is an instance in which the deductions of science, independently of the farmer, entirely agree with and confirm a practice of which the experience of farmers has long ago approved. This is, in fact, an instance in which, had it not been forestalled by experience, the suggestions of science might have been adopted with great advantage. Let this one instance be added to the many now existing, the tendency of which is to excite and increase the confidence of farmers in the results obtained by scientific men. If a knowledge of these results were generally diffused, and if confidence in them really existed in the minds of the great body of the tenants of land, the practice of Agriculture would undoubtedly *improve* with rapidity, in the true sense of the word; the expenses of cultivation would diminish, and its returns increase.

ROOKS.

[A CORRESPONDENCE regarding the injury supposed to be done to the farmer by the Rooks has lately been published by J. M. Hog, Esq., of Newliston, Midlothian. It was occasioned by the presentation of a memorial to that gentleman, signed by 54 farmers, including some proprietors of land in that neighbourhood, requesting him, as the proprietor of a very large rookery, to allow means to be used for its diminution. Mr. Hog says, in the course of his answer—

"It is the result of my own deliberate conviction, formed from an observation of the habits of the bird from my earliest infancy, that the injury done by it to the farmer is of the most trifling nature. I believe it is a fact in which all naturalists will confirm me, that the almost entire food of the Rook is grubs and insects—that they prefer these by much to grain of any kind—and that it is only when hard pressed by hunger that they attack this species of food. I think I may call the attention of every observing farmer to what all who have watched their habits must have noticed, that at seed-time they *follow* the harrows, picking up the worms which are dislodged from the broken clods, not *preceding* them, as they would certainly do were their object GRAIN instead of GRUBS."

Towards the close of his letter he states his intention of applying for information as to the food of the crow to Charles Waterton, Esq., the celebrated naturalist. The following is a portion of that gentleman's letter, in answer to Mr. Hog's application.]

"I hold the Rooks in great respect. We have innumerable quantities of these birds in this part of Yorkshire—and we consider them our friends. They appear in thousands upon our Grass-lands, and destroy myriads of insects. After they have done their work in these inclosures, you may pick up basketsful of grass-plants, all injured at the root by the gnawing insect. We prize the birds much for this; and we pronounce them most useful guardians of our meadows and our pastures. Whenever we see the Rooks in our Turnip-fields we know then to our sorrow what is going on there. We are aware that grubs are destroying the Turnips; and we hail with pleasure the arrival of the Rooks, which alone can arrest their dreaded progress. I have never seen the least particle of Turnip, or of Turnip-tops in the craws of the Rooks, either young or old. If these birds feed on Swedish Turnips in Scotland, they abstain from such food here; so far as I can learn by inquiry. Perhaps they may be taking insects at the time that they are seen perforating the Turnip. Dissection could set this doubt at rest for ever. No farmer in our neighbourhood complains that his Swedish Turnips are injured by the Rook. The services of the Rook to our Oak-trees are positively beyond estimation. I do believe if it were not for this bird, all the young leaves on our Oaks would be consumed by the Cockchafers. Whilst the Ringdove is devouring the heart-shoot of the rising Clover in spring, you may see the Rook devouring insects in the same field.

"The faults of the Rook, in our imperfect eyes, are as follows:—It pulls up the young blade of corn on its first appearance, in order to get at the seed-grain still at the root of it. The petty pilfering lasts about three weeks, and during this period we hire a boy at threepence a-day, sometimes sixpence, to scare the birds off. Some years we have no boy at all. Either way, the crops are apparently the same in quantity every year. In winter the Rook will attack the corn-stacks which have lost part of their thatch by a gale of wind. He is a slovenly farmer who does not repair the damaged roof immediately; and still we have farmers in Yorkshire of this description. The Rook certainly is too fond of our Walnuts; of course, it requires to be sharply looked after when the fruit is ripe. In breeding time, it will twist off the uppermost twigs of the English and Dutch Elms, and sometimes those of the Oak in which its nest is built, for the purpose of increasing it. This practice gives the tops of the trees an unsightly appearance, and may injure their growth in the course of time. Sycamores, Beeches, Firs, and Ashes, escape in great measure the spoliation. It ought to be generally known that, in former times, the North American colonists having banished the Grakles, (their Rooks), the insects ate up the whole of their Grass, and the people were obliged to get their stock of Hay from Pennsylvania and from England. And in the island of Bourbon, the poor eastern Grakles disappeared under a similar persecution. The islanders suffered in their turn; for clouds of Grasshoppers consumed every green blade, and the colonists were compelled to apply to Government for a fresh breed of Grakles, and also for a law to protect them. Thus it appears from history that the sages of the East, and the wise men of the West, did wrong in destroying their Grakles. They were severely punished for their temerity, by the loss of their crops. They repented and repaired the damage; and, so far as I can learn, things have gone on well betwixt themselves and the Grakles, and betwixt the Grakles and the crops ever since. In 1824 I saw immense flocks of these birds in the low meadows of the Delaware. I defend my sable friends, the Rooks, here in England, on account of their services to the land. Should the adverse party effect their extirpation from Scotland, and then suffer by the ravages of the grub, I will, at any time, be happy to send you a fresh supply of these useful and interesting birds.—*Charles Waterton.*" [In a separate communication Mr. Waterton refers to what he has already written on the Rook, in his "Essays," to which I would request attention. As he is now engaged in writing a second volume, for the benefit of Mrs. Loudon, it is to be hoped he will find a place for this subject—as indeed he gives me reason to expect.—*J. M. H.*]

TURNIP CULTURE.—No. I.

THE system which it is our intention to describe is in full operation, and has been in practice in various parts of the kingdom for many years, so that it is no new thing, no mere fancy.

The science of Agriculture is founded on those fixed principles which regulate the operations of Nature, and whether the farmer knows them or not—whether he endeavours to carry out these principles or not—Nature will constantly proceed in her own way acting upon them; and any striving against her, whether in ignorance or not, must result in loss. It is then of the greatest importance for us to know the principles which regulate vegetation, and, before proceeding to describe the mode of cultivating the Turnip crop, it may be well first to inquire into the nature and habits of the plant itself. We shall thus be likely to ascertain the kind of cultivation and the condition of soil which it requires to make it grow in perfection.

The leaves of the Turnip plant are large, with thick fleshy veins, rough and prickly, having the power of evaporating or imbibing a large quantity of moisture; and it is said that the plant, by virtue of these large leaves, receives a great part of its nourishment from the atmosphere. The roots, which are sent out laterally from the tap root, present a fine silk-like appearance, and extend to a great distance, till they meet with the obstruction either of other roots or of uncultivated land. When the soil is well cultivated, they extend to the distance of two or three feet from the centre of the plant, ramifying in every direction, crossing and re-crossing each other, forming a complete net-work over the whole of the cultivated soil. This may be observed in the soil between the rows, when it has been deeply and repeatedly horse-hoed or ploughed and harrowed; but when the soil has not been well pulverised between the rows, the fine filaments of the roots cannot push themselves in search of nourishment.

The bulb is that part of the plant for which it is cultivated; it generally takes a globular form, sometimes more of a cylindrical shape, conical at the root, and globular or even flat at the top. The bulb, when it is ripe and fit for use, has a fleshy substance full of juice, generally of a sweetish though sometimes of an acrid taste. When fresh, the Turnip bulb contains about 89 per cent. of water.

The roots of all plants that are cultivated by the farmer push over a large horizontal extent in search of nourishment; an extent which is limited generally by the distance at which the plants are placed on the ground, *i. e.* provided Nature do not fill up the space between them by natural plants (weeds). When this distance is great, the roots are most extensive, and the plants are proportionably luxuriant; but when the plants are thick on the ground, their roots extend and intermingle with the roots of those that are nearest, and are limited in their growth and bulk. Hence a necessity of having only the plant we cultivate growing in the field, and of extirpating weeds of every description, during the whole process of the growth of any crop.

The spongioles which are at the termination of the small fibrous roots, take in nourishment from the soil; and as the fibrous roots spread over the whole of the cultivated land, it is evident that if we give to this active soil a regular and equal supply of manure, and at the same time make and keep it in as perfect a state of cultivation, and the greatest possible depth which circumstances will allow, we may expect the greatest return which the active soil, under its present condition, can produce.

As the size and quality of every vegetable greatly depends on the size and number or the surface of its leaves, the advantages of attending to the growth of the leaves of bulbous-rooted plants must be evident. By increasing the growth of the leaves of the Turnip plant, we furnish it with the means of increasing the bulk of its bulb; for if the leaves be to the vegetable what the lungs and stomach are to the animal—if they are large, the roots will naturally be large also. When, therefore, we have our Turnips so close together, that the leaves have not room to grow, we prevent ourselves of getting a good crop of roots.—*John Morton, Whitfield, Thornbury.*

ON BLACK HORSEPONDS.—No. II.

THE office performed by the kidneys in man and animals is that of separating from the blood the soluble saline substances, as well as the nitrogenous matters which are destined to be carried out of the animal system; these substances we find dissolved in water in the urine, and they exist in much larger quantities in it than in the solid excrements of animals; yet how little attention is bestowed by the farmer in collecting and preserving this valuable liquid! The solid matter contained in the urine of man and our domestic animals is at least as rich, if not richer in quality, and capable of supplying plants with as large an amount of nitrogenous, as well as of inorganic food, as the best guano imported, and when judiciously applied to the land is found to produce an effect on the crops in every respect equal to it, giving a large increase both in the quantity and in the quality of the produce. The amount of dry fertilising matter annually lost to the farmer, who allows the water from his cattle stalls and stables to waste, valued at the present price of guano (10*l.* per ton), will amount to a sum of money which few imagine, and from which, under judicious management, and at a trifling cost, the full effect of a powerful manure might be obtained.

The solid matter, both organic and inorganic, as well as water, contained in 10,000 parts of the fresh urine of man, and some of our domestic animals, will be seen by the following table:—

Urine of	Water in 10,000 parts.	Solid matter in 10,000 parts.		
		Organic.	Inorganic	Total.
Man	9690	230	76	306
Cow	9300	500	200	700
Horse	9400	270	330	600
Pig	9260	560	180	740
Sheep	9600	280	120	400

From the above table, it is obvious that for every 10,000 lbs. of the urine of the horse that is allowed to run to waste, 600 lbs. of solid dry matter, of high fertilising power, is lost to the farmer, worth 2*l.* 15*s.* at the present price of guano; and for every 10,000 lbs. of the urine of the cow, the loss would be 700 lbs. of dry matter, worth 3*l.* 2*s.* 6*d.* The same calculation might be extended to the urine of the other domestic animals, and to that of man.

But to prove this statement, and convince the farmer of the great loss he annually sustains, it will be necessary to enter a little more into detail.

From recent observations, made with every precaution to insure success, it appears that the average quantity of urine annually voided by man, the cow, and the horse, amounts to the following quantities:—

Man, 1000 lbs., containing of solid matter 67 lbs.
Cow, 13,000 „ „ „ „ 900
Horse, 1000 „ „ „ „ 60

It may appear rather surprising to many that the amount of urine voided by the horse should not exceed that of man, particularly when the quantity of liquid taken into the stomach by each is considered—the horse often drinking four or five gallons of water in the 24 hours, while man seldom exceeds 3½ lbs. of liquid; the explanation of the cause of this difference is to be sought for in the extent of skin and lungs in the horse capable of giving off large quantities of water as insensible perspiration, while the same function in man seldom amounts to one-tenth part the liquid taken.

It appears also, from the recent experiments of Boussingault, that when a cow is giving milk, a less amount of urine is voided. He found that a horse which drank 35 lbs. of water in 24 hours only gave 3 lbs. of urine; and a cow which drank 132 lbs. of water in the same time gave 18 lbs. of urine, and 19 lbs. of milk. But, besides the amount of water drank, many circumstances tend to modify the amount of water, nitrogenous and saline substances contained in the urine, such as the quantity and quality of the food, the temperature of the air, and amount of exercise.

As an illustration of the loss sustained by a farmer who allows his liquid manure to run into his horse-pond or nearest ditch, we will take the case of one occupying 500 acres of land, consisting of 400 of arable, and 100 of pasture; supposing the stock on such a farm to be about 50 head of oxen, 20 horses, and 60 pigs, besides sheep.

If we only take into account the urine of the oxen, horses, and pigs, the sheep not being in the fold-yard, we shall have 45,000 lbs. weight, or upwards of 20 tons, of dry fertilising matter contained in the liquid manure, which, at 10*l.* per ton, would be worth no less than 200*l.* sterling. The urine of the horses would yield an amount equal to 1200 lbs., or nearly 11 cwt., equal in value to 5*l.* 10*s.*; and if the pig only passes 3 lbs. of urine in 24 hours, the 60 pigs would produce 4140 lbs., or nearly 2 tons of solid matter, worth 20*l.*; making a sum total of dry matter equal to 22 tons 11 cwt. in weight. Now, taking the solid matter, which is in fact identically the same as guano, at the price of guano, viz., at 10*l.* per ton, it would be worth no less than 225*l.* 10*s.* annually.

If we assume that 3-4ths of this valuable manure is annually wasted through bad management, the loss to the farmer of every 500 acres of land is equal in weight to 16 tons annually; and if 3 cwt. of guano is sufficient to keep an acre of land in a high state of fertility, he here loses the means of manuring no less than 105 acres of land at the same rate; and if we extend our calculation to the whole kingdom, the subject becomes far more important. It is estimated that the number of cattle in the United Kingdom amounts to eight millions: hence, if we multiply the dry solid matter contained in the urine voided annually by one ox, by the number of cattle, we have upwards of 3,000,000 tons, which, at 10*l.* per ton, will amount to 30,000,000*l.* sterling, or more than six times the amount of the income-tax of the country, and as much as would purchase 4½ cwt. of guano for every acre of arable and garden land in England, Ireland, Scotland, Wales, and the British Isles!*

In Holland and Flanders, they well understand the amount, and appreciate the value of these manures; but how little knowledge exists of either in this country!—*Alfred Gyde, Painswich.*

ON THE CULTIVATION OF FLAX.—No. VI.

WHEN the saving of seed for sowing is an object, it is better that the Flax should be stacked up so soon as thoroughly dried, and the treatment of it can afterwards be resumed when convenient. This is the Courtrai system, so called from the name of the district in the north of France, in which it is so successfully practised. This system is peculiarly deserving of the attention of flax-growers in this country, especially such as can afford to wait for a season for a return from their capital, for which they will be amply repaid.

In the Courtrai district, the Flax, after being pulled, is placed on end in a very peculiar manner, of which the annexed figure will convey a better idea than the most lengthened description. Though apparently loosely placed on end, it is so skilfully arranged, that it is difficult to blow it down by winds, nor do the heaviest rains penetrate it. In a few days, usually eight or ten, according to the state of the weather, it will be sufficiently dried, after which it is bound up into bunches. The Flax is then made up into small wind-stacks, as they are termed, only a single bunch in breadth, and after remaining some time further in this state, it is ready to be at once carried to the barn, or stand in some convenient situation until the further operations of the manufacture are to be commenced. The method of storing in this case will not differ from that employed in the case of grain crops in the stackyard. In this state the Flax may be kept for an indefinite length of time without injury,—nay, indeed, but with absolute advantage,—experience having proved that in the second or third year which it remains in the stack, it will have materially improved in quality. An important advantage gained by this system of treatment is that of being able to have the watering and grassing done in the summer, when the weather is more favourable than the autumn. May or June is the usual time to steep Flax thus treated, but it may be done at whatever period of the summer may be most convenient. In the flax-growing districts in Ireland considerable prejudice exists against this system, it being supposed that allowing the stem to harden before steeping, injures the quality of the fibre; but the superiority of the Courtrai Flax shows that such is not the case.

The seed may also be taken off Flax treated in this manner at any convenient time; but it is usually done during the winter, that the seed may be ready for sowing in the spring; and after the performance of this operation the crop is again stacked up as before. It would obviously be more convenient to take off the seed immediately before steeping the Flax, when the labour of re-stacking would be saved; but the steeping takes place at too late a period of the season to admit of that arrangement. This is not done by the ripple, as in the former case, but by repeated strokes of a stick, the foot being, at the same time, kept on the root end of the Flax, to prevent it from being turned about or disarranged, which would interfere with the after processes of the manufacture.

The next operation in the treatment of Flax is watering, and the mode of conducting this does not vary, whatever the previous management may have been. It is to be observed, however, that when the Flax has been dried, a longer time will be required in the water. The object of this process is to facilitate the separation of the fibre from the stem, the mucilaginous matters causing the fibres to adhere to it, thereby partially undergoing the putrefactive fermentation. The water should be what is termed soft; to insure which it should be collected several days in the pond before being required: nor is it to be changed during the time the Flax is in it, the quantity lost by leakage from the pond and evaporation being, however, cautiously supplied. But, above all, it is necessary to guard against the use of water impregnated with mineral matters, which would prove most injurious to the Flax. This must be guarded against by previous examination; but to prevent any mistakes on this point, if the quality of the water is in any degree doubtful, it will be well to have a cut formed all round the pond, which may be filled up with stones, observing that the cut or trench thus formed shall be considerably deeper than the pond. This arrangement will, in general, prevent the ingress of injurious matters. The water should be at least of sufficient depth to admit of the Flax being placed almost upright. The length and breadth of the ponds will obviously be regulated by the situation and quantity of Flax to be steeped, observing that more than one day's pulling should not be placed in the same pond. The Flax is put into the water with the root end uppermost, and a covering of straw or other matters not liable to rapid decomposition, is found to be advantageous in preserving uniformity of colour, by shading off the light. After being covered in this manner, stones are placed along the surface, to keep all under the water, and in this state it remains until it is ready to be taken out of the pond. Although any considerable current of water passing through the pond has been said to be injurious, such a flow as will carry away the impurities caused by the fermentation is necessary to produce fibre of a good colour.

The time required in the water is variable, being regulated by the state of the weather, the quality of the water employed, and the degree of ripeness or dryness which the Flax had previously obtained. When properly watered it will be observed to sink in the pond, and the fibres will separate freely from the stalk on its being broken and rubbed by the hand. Eight or ten days will in some cases be sufficient, and in others ten or twelve may be required; but repeated examinations of the Flax itself only can be depended on. For this purpose a few stalks of average quality should be taken from bunches in different parts of the pond, and carefully examined, as before directed. While it is important that the watering process should have been continued until the fibre readily separates from the stem on being rubbed, an excess of watering is to be strictly guarded against. It is apparent that carrying the fermentation beyond a certain extent would cause the destruction of the Flax altogether.

After being taken out of the water, the Flax is placed on end a few hours, on the bank, to drain, the bunches supporting each other. It must not be allowed to remain long in this state, as the action of the water would continue unimpaired on the inside bunches, by which they would continue to get softer, while those on the outside, being comparatively dry, would not be affected. This, then, would interfere with uniformity in the watering, and lower the value of the Flax.

Grassing is the next operation in the management of the crop; the intention of which is to remedy any defects in the watering, and to wash and bleach the Flax by exposure to the sun and rains. Pasture-land, on which the Grass is short and close, is the proper place on which to spread the Flax; and in this operation it is important to distribute it evenly on the surface, and to make the rows perfectly straight, to prevent confusion in turning. It should also be rather thickly spread, to prevent the weather from hardening it too much before being properly bleached, and further, to prevent it from being easily tossed about by the winds. After remaining a short time on the Grass, it is turned over by long poles, or wattles, run under the rows, beginning with the first row, and proceeding so that the second falls upon the ground occupied by the first. The object in turning the Flax, is to secure both sides being equally bleached and washed; and with such facility is this process performed on the Continent, that after three or four turnings, the crop is as evenly and regular in the rows as when first spread. The turnings, as far as possible, are performed immediately before rain, so that the Flax may be laid down by it, and obtain a better hold of the Grass—if the phrase be allowed—as it is obviously more easily disturbed by wind after being turned than before. Turning the Flax is never neglected on the Continent, and hence a primary cause of the uniformity of colour of the fibre so treated. Recent trials in Ireland have shown that at least 2*s.* per stone are lost by neglecting this particular alone.

The length of time during which the Flax should remain on the Grass, will depend on the weather and state of the Flax itself. If not fully watered, a greater length of time will be required on the Grass; and in dry weather a longer time will be necessary than in wet weather—the reason of which is obvious. The precise time required, either in watering or grassing, can only be ascertained by careful observation; and to guide the flax-grower on the point, some experience is necessary. Fibre of an inferior quality will be the result of allowing too short a time for these processes; but an excess of either is still more injurious, as effecting the destruction of it altogether. Before taking up the crop off the Grass, it is important that it should be thoroughly dried; to secure which, in a still greater degree, it is usually placed on end for a short time in the field. It is afterwards formed into small stacks, loosely built, in which it may remain without injury for a length of time, until it is convenient to resume the manufacture.—*J. Sproule.*

ON BREEDS OF SHEEP.

THE management and selection of any breed of sheep must, after all, become matter of pounds, shillings, and pence. The question the farmer has to consider is, what description of sheep will in the long-run return the most profit; and this question must be viewed in strict relation to the management he will be able to adopt on the particular farm on which he may be located. It is not therefore a simple, but a compound question. It is not merely which breed will make most flesh and fat, but which will make it in the shortest time and on the least food; which can bear the weather, or hard keep, or travelling, or a particular mode of management, with the greatest impunity. All these considerations must enter

* From Mr. Couling's statement to a Committee of the House of Commons, it appears that 13,746,950 acres are under arable and garden culture in Great Britain.

into the farmer's mind before he can come to a sound conclusion. From the want of making these considerations many fatal mistakes have been made, and a flock has been selected altogether unsuitable to the soil, and incapable of bearing the severity of the weather.

The two breeds which appear as rivals in their claims on public attention are the New Leicesters and the South Downs. It cannot be doubted that, as far as propensity to fatten and early maturity is considered, the Leicester will not only rival, but eclipse all others; for these qualities the former may justly be considered as a model, and all other breeds will possess these qualities in a greater or lesser degree, in proportion as they possess the similitude of the form and points of the Leicester sheep. The South Down itself will not be an exception to this rule, for if the improved and the neglected specimens be compared together, it will be found that the excellencies of the former consist in those points which approximate most to the Leicester. The wool, too, is also a consideration; for the fleece, from its greater length and weight, will bring in nearly double that of the Down. Where, therefore, the pasture is very fertile, and the sheep can be tended with much care and without exposure, the Leicester may be justly regarded as the most profitable of the pure breeds. Its drawbacks, however, are the incapability of the animal for bearing exposure, or travelling, or living hard; in fact, its weaker constitution, and greater liability to inflammatory disorders. It is thus unfitted for the purposes of folding, or for the exposure of the South Downs, and still more for contending with the severities of the Grampian hills or the Welsh mountains. In such localities these sheep could not endure. Then again, the mutton is by no means so good as the South Down, which, however, is partly, not wholly, owing to the early period (twenty months) at which they are fit for the butcher, and partly to the very large proportion of tallow in proportion to the lean. Thus it is not a favourite in the London markets, and accordingly, of late years, the first cross between the Leicester and the Down has been produced instead of the Leicester; and it is contended that this first cross is the most profitable sheep that can be fattened, making greater and more rapid progress than the Down, and better meat than the Leicester, and possessing, to some extent, the dark faces of the Down, which sign-manual of their origin renders them a greater favourite with the butcher.

The South Down, or rather the improved South Down—for there is a great difference between the two—possesses most valuable qualities; with a propensity to fatten inferior only to the Leicester, but with later maturity (often 32 months, though considerably shorter than what it once was), this breed are excellent travellers, well adapted for folding, hardy compared with the Leicester, and capable of living on short pasture, and perhaps the best of all breeds for the Down farms of the South of England. The mutton, too, is more esteemed than any other, with the exception of the small mountain sheep. Perhaps there is no ancient pure breed of sheep that has undergone so much improvement as the South Down, and it affords the owners of other breeds a proper example, showing what can be done by care and attention, and the application of proper principles. Nothing can afford a better proof of the sterling qualities of this breed than the facts that some 20 or 30 years since, the price of South Down wool rendered the fleece a matter of great importance; and now, although the price is reduced to one-third, and it can never expect to realise much advance, yet, notwithstanding this, the valuable qualities of the animal, and the improvements that have been made, have enabled the breed still to retain a foremost rank in public favour.

With these two valuable breeds, each adapted for different pastures, it may, perhaps, be asked, What need is there of any other? It will, however, be found that in the marshes of Kent and many other places, the superior hardihood of the native breeds has rendered them more profitable than the Leicester, though, unquestionably, crosses with the latter have much improved their value. And notwithstanding the eminent qualities of the South Down, they have been found not sufficiently hardy to endure the severities of the Grampian hills or the Welsh mountains. They have been tried and found wanting: vast numbers have been destroyed by the rigours of winter in these bleak situations, and the losses that have accrued to many parties have deterred others from following their example.

The Cheviot sheep possess many valuable qualities; decidedly inferior to the South Downs in their fattening powers and their early maturity, they are superior in these points to all other mountain sheep, and, in hardihood, even to the South Down, and are thus the best adapted to their native hills, and all other pastures of a similar character. When carried, however, to the extreme north and the islands of Zetland and Orkney, it is said they are not sufficiently hardy for these extra rigorous places, although it is probable, with a little increase of care, they might be rendered so, and they would then be far more profitable than the ungainly forms of the native breed.

These three breeds—the Leicester, the South Down, and the Cheviot—may be considered as the principal pure breeds which this country possesses. They are essential to the variety of pastures which obtain, and without them this country could not be properly stocked. Other breeds, which it may be advantageous to adopt, either possess peculiar qualities which render them valuable, or have been crossed extensively with more improved breeds. [Extracted, by permission, from a forthcoming work on sheep, by Mr. W. C. Spooner, of Southampton.]

SKETCHES OF EAST LOTHIAN HUSBANDRY.

As the subject of tenure appears to be now exciting much attention, a brief account of the connection subsisting between landlord and tenant in this district, may prove interesting at the present time; particularly as it is, I believe, generally regarded as incontrovertible, that the prosperity and acknowledged excellence of Lothian Agriculture, the high rentals of proprietors, and the comparative happiness and contentment of the rural population, are mainly attributable to the secure and liberal conditions on which the farmers hold possession. The principal points to which I propose adverting, in my remarks upon this subject are, 1. Mode of letting or renting Farms. 2. Time and conditions of entry. 3. Varities of tenure and usual covenants of leases. 4. Amount of rent and public burdens. 5. Different modes of paying rent.

1. When a proprietor has a farm to let, his factor advertises the circumstance in the newspapers, stating its situation and extent—also the duration of lease, time of entry, kind of rent, whether a money or a grain rent, or a combination of both, together with any other particulars connected with, or which may enhance the value of the farm. Any individual whom such a farm and conditions may suit, goes immediately to inspect it, accompanied and assisted in its valuation by a few of his cleverest agricultural friends. All the ability and practical skill of the would-be-tenant and his advisers, are of course called forth, and required on this momentous occasion: they carefully examine the fields, fences, buildings, &c. separately and minutely, particularly attending to the nature of the soil and subsoil,—its condition with respect to weeds, wetness, and fertility, besides a great many other considerations which may enable them to arrive at a tolerably correct estimate of the productive capabilities of the farm, its advantages and disadvantages, but above all, the amount of rent which it may be safe or advisable to offer for it. All tenders, or written proposals, are lodged, up to a specified date, (generally a month prior to the period of entry,) with the factor. When a candidate for the farm is well known to the landlord, or his agents, as a man of capital and enterprise, no security is required of him, but in the case of strangers and those whose funds and ability for the payment of the stipulated rent, and the fulfilment of the other obligations of the lease, are unknown or questionable, ample and unexceptionable security is demanded for having the farm "stocked and cropped, and the first rent paid." In the course of a few days after the time limited for receiving proposals, the successful candidate for the farm is announced, and the others apprised of their failure. In the majority of instances the highest bidder obtains the farm, but this is not always or necessarily the case, the highest offer being sometimes rejected and the preference given to some more favoured competitor, although promising an inferior amount of rent.

2. Possession is given almost invariably throughout Scotland at the Whitsunday and Martinmas Terms (May 15 and Nov. 11), but the former is the usual period of entry in this county. The straw of the last or away-going crop is sometimes left by the out-going tenant in "steelbow," according to previous agreements, that is, it descends without purchase to the new tenant, he, in like manner, having to leave a similar provision for his successor. This evidently useful regulation is not, however, so common in this as in some of the adjoining counties. In the majority of instances the whole of the dung made from the penult, or last crop but one, must also be left for the use of the new tenant, for which he pays his predecessor according to the valuation of arbiters mutually appointed. The incoming tenant has likewise to pay for the young Grass (the previous year's sowing) and fallow, if any; but he is entitled to compensation from the old tenant, or from the landlord, should the former neglect to leave in Grass of different ages, and in bare or summer fallow, the precise proportion of the farm stipulated in the lease, the amount of compensation being estimated by mutually appointed arbiters. He is in his turn, of course, subject to similar obligations at the expiration of his lease.

3. Although the system of leasehold tenure for a limited number of years may be said to be universal in the Lothians, there are still, I understand, a few lingering instances of life-rent leases in the parish of Ormiston, and in one or two other places; but this ancient mode of tenure is deservedly hastening to utter extinction. Life-rent tenure has almost invariably been found highly detrimental to the progress of improvement, and the interests of the landlord, without communicating any corresponding advantage to the tenant. Tenancy-at-will, so prevalent in England and Ireland, is happily altogether unknown here. An East Lothian farmer would consider that individual as insane, who would take a farm, and expend his money on its improvement, on the mere good faith of any man; he must have everything down in "black and white," before he lays out a shilling on the farm. The general duration of leases in this county is for a term of either 19 or 21 years, and as many crops. The restrictive clauses in East Lothian leases are neither numerous nor very stringent, and as referring chiefly to the latter period of the lease, are by no means obstructive to improvements, or prejudicial to the interest of the tenants. No farmer is restricted by the terms of his lease to any particular system of cropping, it being merely stipulated that he is to "cultivate and manure the land according to the rules of good husbandry, and that he must not take two white grain crops in succession during any period of his lease." Sub-letting all or any part of the farm for any unexpired period of the lease, is strictly prohibited. It is also stipulated that no straw or dung will be permitted to be sold, or taken off the farm. The only other restrictions on the farmer's management relate chiefly to the last four or five years of the lease. The tenant is then required to have a certain number of acres in Grass, and frequently also a certain proportion in fallow, dunged or limed, every year towards the conclusion of the lease. With respect to the farm-buildings, it is generally agreed that when the houses are put into a proper "tenantable and habitable state" by the proprietor, the tenant accepting of them as in such a condition, "binds and obliges himself to support and uphold them, during the continuance of the lease, and to leave them at its conclusion in a like tenantable and habitable state." The tenant is bound to have, at the termination of the lease, a certain proportion—usually a sixth part—of the farm in Grass of different ages, and generally also a similar quantity uncropped, as a Turnip or fallow break. He is likewise bound, as before observed, to leave the whole dung of the penult crop upon the premises, for the use of his successor. For the dung and the land that is uncropped, "value is to be paid him according as the same shall be ascertained, by neutral men of skill and capacity mutually appointed." It is perhaps needless to remark, that the chief object of these restrictions is not so much to compel the tenant to observe a certain rotation of crops, or to cultivate the farm "according to the rules of good husbandry"—this he will do from a regard to his own interests—as to preserve the farm undeteriorated in condition, and thereby to enable the tenant upon a new lease to proceed with its cultivation as if the former lease had not expired at all.

According to the law of Scotland in reference to landlord and tenant, the latter cannot sublet or assign the portion of his lease to run, unless expressly entitled by the terms of his lease so to do, which is never the case here. The tenant acquires a right to the use of the fixtures attached to the farm when he made his bargain, and cannot remove any of them, though put up at his own expense, at the end of the lease. Any article, the removal of which will tend to injure the premises, is considered as a fixture. Machinery is generally looked on as moveable. No building erected by the tenant can be removed by him; the landlord, if he think fit, may compel him to remove it, but cannot compel him to leave it in repair. When a tenant runs the amount of a year's rent in arrear, or deserts the farm, the landlord may compel him either to find security for the arrears, and for the rent of the next five years, or to remove. When the tenant is in arrear for two years' rent, he may be compelled to remove.

Sometimes the tenant has what is termed a breach in his lease, generally at the end of the first seven years, whereby he is enabled, should the farm disappoint his expectations, or prove a losing concern, to throw it up altogether to the landlord, after this seven years' trial, or otherwise get such a reduction in the rent as will afford him some remuneration for his capital and industry; very few farms are, however, given up at this period, the landlord generally preferring to reduce the rent considerably.

The proprietor usually engages to render the dwelling-house and offices suitable, and the fences "that they may be able to keep in cattle and sheep," at the commencement of the lease; and likewise to make such other repairs and additions (the tenant always driving the materials), as may be agreed upon. Generally speaking, the East Lothian landlords give much encouragement to all useful improvements, particularly draining, for which some of them allow a considerable sum annually to the tenant, or pay half the expenses; others, again, have tile-works erected in some convenient part of the estate, at which the tenants obtain tiles either altogether free, or at very reduced prices. When the lease of a wet, dirty, impoverished farm expires, the landlord not unfrequently retains it in his own possession for a few years, in order to drain, lime, manure, and clean almost every field, and effect any requisite repairs in the fences and farm buildings, after which he seldom fails to relet it again, at a considerably augmented rent.—*T. Sullivan.*

Home Correspondence.

Culture of Wheat.—In the county of Suffolk, where Agriculture is carried on in a style perhaps not inferior to any county in England, the agriculturists appear to me to manage their heavy-land Wheats in the spring somewhat erroneously; for instance, about the middle of March they are harrowed for the purpose, I suppose, of loosening the top, so as to give the young plants fresh vigour; but after having been harrowed for two or three days they roll them down, consequently what few small clods are left after harrowing are crushed to powder; then after a shower the land runs together, and when the weather sets in dry it cracks in all directions. My idea is, that if the roller had not passed over the land, it would have been left in a much better state, either for wet or dry weather. I am fully aware Wheat likes solid land, and that rolling light and loose lands is very beneficial. Should this meet the eye of any of your experienced agricultural readers, perhaps they would be kind enough to state why Wheat, on heavy lands, should be rolled and harrowed, and what period of the Wheat's growth may be considered the best time for performing these operations.—*D. S.*

Rot in Sheep.—"J. Wighton," in your last Number, requests information concerning the worm that causes the rot in sheep. The "fluke" is the Distonia, or Fasciola hepatica of authors on the subject. I copy the following paragraph from one of the translations of Cuvier's great work. "This species is very common in the hepatic vessels of sheep, and is also found in those of other Ruminantia, and of the hog, the horse, and eve

of man. Its form is that of a small oval leaf, pointed posteriorly, and a narrowed portion anteriorly, at the end of which is the first sucker, communicating with a sort of esophagus, from which arise canals that ramify throughout the body, conveying the bile on which the animal feeds. The species that infest sheep become greatly multiplied when they graze in low, wet grounds, rendering them dropsical, and finally killing them." With regard to the "Sandore," I cannot find it under that name in any book; but a species is mentioned of similar habits as the D. hepatica, namely, D. lanceolata, which may be the one in question. Neither the one nor the other are the "produce of insects." They are perfect animals, forming a genus of the second class of the Radiated Animals. Whether they arise from spontaneous generation, owing to circumstances of diet and habitation of the sheep, or from any other source, is a question which has not, as far as I am aware, been answered with certainty as yet. I have read somewhere that a creature of analogous nature to the fluke infests the marshes of the Neva, near St. Petersburg, which, climbing on the stems of the rushes, fastens upon the uncovered parts of the legs of men, horses, or cattle, and eats into the flesh, causing insufferable torment. The fluke might have a similar origin, but that it has never been found out of the sheep's liver or that of other animals.—*N. D. D.*

Grass Lands.—In several works on farming considerable stress is laid on not allowing cattle to be turned into the Grass-fields in winter, for fear of poaching the ground with their feet. There is an idea in this neighbourhood that this is rather beneficial than otherwise, as we find that several fields which are trampled on every winter are in the dry weather rendered level by the same means; and all the moss being killed, and the surface of the ground broken up, they produce better Grass than the rest of the land, even when equally manured. It is a common saying that an old pasture is hide-bound. I hope your more able correspondents will give us their experience in this matter.—*J. R. Pearson, Nottingham.*

Yew.—In your Paper of the 13th inst., it is said by one of your correspondents, respecting the Yew, that, "if it is withered, it is a deadly and quick poison—if green, perfectly harmless." With the first part of this observation I agree, but my experience contradicts the opinion that, "if green, it is harmless;" as some winters since, during a severe frost, my sheep having crossed a frozen ford into a plantation abounding with Yew, several having browsed upon it, died in the course of a few hours. I think it probable, as snow covered the ground at the time, and nothing green was visible excepting the Yew, the sheep being fat, and consequently in a pampered state, were tempted to devour food that animals more in a state of nature would have rejected.—*A Subscriber.*

Potatoes.—Your correspondent, "H. P. T.," in No. 17, expresses his surprise that Potatoes should be so good as he found them, having been left in the ground all the winter; why, it is the only way to have them good in the spring! I mentioned some weeks back that all root crops to be preserved in their natural state must be left where they grew. The few Swedes I earthed up this season in the rows, after cutting off the top to prevent sprouting, are good now, retaining all their properties; so also are the carrots.—*S. C.*

Sea-weed as Manure.—A few questions having been addressed to a very intelligent correspondent in the Isle of Thanet respecting the mode of using sea-weed as a manure in that district, and the supposed results, the substance of the answers may, perhaps, be acceptable to such persons as are interested generally on the subject of manures; and through the same quarter it is hoped that we shall be enabled to give a chemical analysis of the substance resulting from the decomposition of the algæ. Sometimes the weed is merely brought to the top of the cliff and laid in a heap, where it is allowed to rot. The more approved plan, however, is to put a layer of mould, then a layer of sea-sand, and then one of stable-dung. Those lands profit most from the dressing which have had the least of it previously; but, perhaps, most benefit is obtained in stiff soils, *cæteris paribus.* It is good, indiscriminately, for any crop. It does not appear that after a series of years the land is deteriorated by the presence of magnesian salts, because the farmers are always eager to use it when it can be obtained; and many lands adjoining the shore have had it applied constantly from time immemorial, and it is still used and found to be beneficial. Sea-weed hastens very decidedly the decomposition of other manures when mixed with them; neither salt nor soda do good to land which has had the sea-weed manure. It is never applied alone, but if rotted separately is mixed with other manure. Nothing will grow for several years on the spot where a pure sea-weed heap has rotted, except it be a few species of Atriplex.—*M. I. B.*

Turnip Fly.—To prevent the attacks of fly on Turnip plants, sow by hand 12 bushels of the finest road-dust early in the morning; this will coat over the plants with mortar, and is as efficacious as lime. Plenty of it may be obtained just now, which should be collected and kept dry for use. Your correspondents often mention the application of ashes with mixtures for manures, without saying whether they are coal or wood ashes. See p. 285, "Model Experiment."—*E. B.*

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

(*Continued from page 307.*)

Guano.—Experiment I.—Tywarnhayle Farm: aspect south-eastern, protected from the sea-winds; soil, argillaceous character, with deep retentive clay subsoil. Mr. Karkeek considered it almost impossible to find a more barren spot than this part of St. Agnes Common exhibited previously to its inclosure; there being scarcely turf enough left to make the hedges, and the greater part being chiefly subsoil. The following Table exhibits the method of cropping and manuring adopted by Messrs. Davey and Redruth, in their first experiment:—

A. R. P. 6 3 12 Statue.	When sown.	Manure per acre.	Produce per acre.	Second Sowing.	Manure per acre.	Produce per acre.	Third Sowing.	Manure per acre.	Produce per acre.	Seeds & Manure.	Present appearance.
Broken in 1839.	Wheat in Autumn.	3 qrs. of bone. ¼ acre had 30 bushels of lime.	Fit only for pigs and fowls.	Oats in 1841.	Nitrate of Soda 1 cwt.	36 bushels imp. of Oats per acre.	Barley in 1842.	Truro Town-dung, 9l. per acre, including carriage, &c.	18 bushels per acre.	Seeds. 2 cwt. guano.	Very superior Grass.

It will be seen from this experiment, that the soil was not sufficiently powerful to produce a crop of Wheat, manured over with bone-dust 3 qrs. to the acre. In the Oat crop the following year, manured with 1 cwt. of nitrate of soda, we have 36 bushels of Oats and no seeds; in consequence of which the field was tilled to Barley in 1842, and dressed with Truro (scavengers') dung, at a cost of 9l. per acre, including carriage. Here was another failure, the produce being only 18 imperial bushels per acre. The crop of seeds in the early part of the spring of 1843 made but little progress, in consequence of which it was dressed with 2 cwt. of guano per acre; and its growth shortly after this was surprising. So abundant was the Grass during the summer, that it was a wonder to the neighbourhood how so much stock could have been kept for so great a length of time. Where the lime had been employed for Wheat, the Grass was by no means so thick as in other parts.

Experiment II.

A. R. P. 4 0 2 Statute.	First crop when sown.	Manures used p. acre.	Produce per acre.	Second crop when sown.	Manures used p. acre.	Produce from guano per acre.	Produce from dung and compost.	Seeds.	Manures.	Present appearance.
Broken in 1840.	Wheat in November.	Bone-dust, 3 qrs.	None.	Oats in 1842.	2 cwt. of guano.—10 loads of compost-dung, earth, &c.	77 bushels of White Oats.	29 bushels of Black Oats.	1843.	2 cwt. of Guano.	Very superior.

In this second experiment it will be seen that the Wheat failed as in the first, evidently showing, in Mr. Karkeek's opinion, that Wheat was not adapted to the new soil; whilst in the following year a beautiful illustration was afforded of the effect of guano on a crop of Oats. Messrs. Davey had now, it appeared to him, learned by experience that the method of cropping and manuring which they commenced with, was not such as would be likely to prove successful; and accordingly, in the succeeding experiment, they began cultivating the next piece of waste by taking a green crop first, following it by a crop of Oats.

Experiment III.

A. R. P. 4 1 0	First Crop. Turnips, sown in June.				Second Crop. Oats, sown 1842		Seeds, 1843.	
	Four separate acres, manured each with				Manure, per acre.	Produce per acre.	Manure, per acre.	Present appearance.
	Dung, 25 loads.	Sea-weed.	1 ton of horn, &c.	4 qr. of bone-dust.				
	Produce.							
Broken in 1841.	Pasture, 15tons	None.	None.	Swede 18tons	2 cwt. guano.	72 bshls. of Black Oats.	15 loads farm-yard dung.	Very superior

In this experiment Mr. Karkeek considered the trial between bone-dust and the Truro dung as the first thing worthy of attention, the result showing a profit in favour of the bone-dust, and a loss of 5l. 15s. on the dung; the horn, &c. (being the sweepings of a button and comb manufactory, consisting of filings of bone, horn, and ivory), and the sea-weed, producing no effect whatever. The difference per acre in the expenses in this trial between bone and dung might be estimated as follows:—

Dung.	£	s.	d.	Bones.	£	s.	d.
25 loads dung, at 5s.	6	5	0	4 qrs. bones, at 23s.	4	12	0
Carriage of do., at 4s. per load	5	0	0	Carriage do.	0	6	0
Spreading do. on land	0	10	0		4	18	0
	£11	15	0				

Value of Manure.	Produce.	Value per ton.	Value of Produce.	Difference between value of Crop and Manure.	Profit and Loss.
£ s.	tons		£ s. d.	£ s. d.	
Dung, 11 15	Pasture, 15	6s.	4 10 0	7 5 0	Loss.
Bones, 4 18	Swedes, 18	8s.	7 4 0	2 6 0	Profit.

Again, in the second crop as much as 72 bushels of Oats were produced by 2 cwt. of guano per acre. Where the horn and bone sweepings had been used previously for Turnips, the Oats and seeds were decidedly the better part of the field; bone next, dung next, and sea-weed the worst part of the piece. Where the horn had been employed the land has at the present time a far better appearance than any fields in the neighbourhood. The three fields on which the previous experiments were made kept 30 ewes, 30 lambs, 4 oxen, 3 horses, and 30 pigs, from the commencement of May until the harvest. The Grass was cut and carried into the stable for the horses, the field having since that time been well stocked with sheep.

Experiment IV.—This experiment was made on a piece of waste, similar to the former ones, and adjoining to them.

Statute A. R. P. 4 0 25	First crop sown.	Manure per acre.	Produce per acre.	Second crop sown.	Manure per acre.	Produce per acre.	Seeds.
Broken in 1842.	Swedes in July.	4 qrs. bone-dust and one cwt. guano.	20 tons Swedes.	Barley in 1843.	10 cwt. of hoofs of animals (10l. per ton at the farm), and one cwt. of guano.	12 imperial bushels only.	The Clover and Barley early choked by the Rye-grass.

The circumstance considered by Mr. Karkeek as most worthy of notice here, is the powerful effect produced by the hoofs of animals, in conjunction with guano, on the Oats and Rye-grass; the latter growing in such an astonishing degree, that it completely choked the Clover, and very nearly the Barley. The field has now the appearance of an old coarse pasture. The effect of guano and bone-dust mixed is also seen in an excellent crop of Swedes, 20 tons to the acre. Experiment V.

Statute A. R. P. 8 2 37	First crop sown 1842.	Manures per acre.	Produce per acre.	Second sowing 1843.	Manure per acre.	Produce per acre.	Present appearance.
Broken from the common, 1842.	Turnips and Swedes sown late.	4 qrs. bone; one cwt. guano.	18 tons.	Oats.	2 cwt. guano.	60 bush. per acre.	Very superior.

In this experiment we have a similar effect produced by a mixture of bone and guano manures on Swedes; and in the following year another excellent crop of Oats, with only 2 cwt. of guano per acre.

The expenses incurred by Messrs. Davey in cultivating an acre of waste were nearly paid by the two first crops, leaving the value of the straw, about 1½ ton per acre, to pay for incidental expenses. Mr. Karkeek estimates their expenses per acre in cultivating for the first crop as 11l. 17s. 6d., and for their second crop 15l. 10s., and the value of the produce on the two first crops only as 14l. 8s. The profit arising from the feeding of stock on the seeds is not considered in this account; but he thinks an idea may be formed of their luxuriancy from the circumstance, that during the summer Messrs. Davey received sevenpence per week for the keep of fat sheep belonging to butchers, and at Christmas last sixpence per week, the fields being now equal in appearance to others let at 20s. per acre in the same neighbourhood, it having also been found that the expenses incurred in picking and carrying off the stones from the different inclosures, were more than repaid by the sale of the stones for the purpose of repairing the turnpike roads.

The following communications were referred to the Journal Committee:—Sir Charles Lemon, on the Medical Treatment of sickly Trees; Mr. Rodwell, on the Cultivation of Italian Rye-grass; Mr. James Haywood, on Excretionary Manures; Reports on Ox and Horse Teams, from the Rev. Thomas Cator and Mr. Frederick Manning; and a Letter from Mr. Meyer, on the Destruction of Rats. Mr. Charles Knight presented a complete set of his industrial Guide Books on agricultural, mechanical, economical, and other subjects; Mr. Bencraft, specimens of his patent Hames and Spring-saddle; Mrs. Loudon, a copy of the Complete Supplement to the Encyclopædia of Agriculture; Mr. Thompson, a copy of his Prize Essay on Manures; Mr. Shaw, the Farmers' Magazine for May; Mr. Jopling, his Treatise on Field Gates; and Mr. Mechi, copies of his Statement on Agricultural Improvements,—for all which communications and presents, the best thanks of the Council were ordered.

The Council then adjourned to Wednesday next, the 15th of May.

A WEEKLY COUNCIL was held at the Society's House in Hanover-square, on Wednesday last, the 15th of May; present, the Right Hon. Earl Spencer, President, in the Chair; Marquis of Downshire, Lord Bridport, Lord Camoys, Hon. Capt. Spencer, Hon. G. H. Cavendish, M.P.; Hon. Capt. Dudley Pelham, Col. Austen, T. Raymond Barker, Esq.; J. Raymond Barker, Esq.; Burton Borough, Esq.; F. Burke, Esq.; Sir C. Burrell, Bart., M.P.; Rev. T. Cator; Col. Challoner; J. Evelyn Denison, Esq., M.P.; T. Ellman, Esq.; R. Etwall, Esq., M.P.; J. H. Hodgetts Foley, Esq.; A. E. Fuller, Esq., M.P.; B. Gibbs, Esq.; H. Hall, Esq.; Sir J. Johnstone, Bart., M.P.; Rev. R. H. Leeke; Col. MacDouall; Sir C. Morgan, Bart.; A. Ogilvie, Esq.; J. Parkes, Esq., C.E.; E. Parkins, Esq.; H. Price; J. Read, Esq.; E. A. Sanford, Esq.; Prof. Sewell; W. Shaw, Esq.; R. A. Slaney, Esq.; T. Tweed, Esq.; T. Walmesley, Esq.; and G. Wilbraham, Esq., M.P. The following new members were elected:—

Parker, William, Ware Park, Herts.
Comins, James, South Molton, Devon.
Brine, William, Tolpuddle, Dorchester, Dorset.

Livesey, Joseph, Stourton Hall, Horncastle, Lincolnshire.
Brisco, Musgrave, M.P., Coghurst Hall, Hastings.
Baker, Baker, Hastings.
Fielder, Charles, Sparsholt, Winchester.
Marfleet, John, Mattingly Farm, Easton, Hants.
Walker, Charles, Sutton, Tenbury, Worcester.
Wayne, Thomas Moore, Manor House, South Warnborough, Odiham, Hants.
Hood, Daniel, Whitsbury, Fordingbridge, Hants.
Parfect, Ambrose, Jun., Corton, Heytesbury, Wilts.
Holder, James, Bodiam, Staplehurst, Sussex.
Harper, John, Shermanbury, Horsham, Sussex.
Powles, James, Woollaston Grange, Chepstow, Monmouth.
Arnold, Thomas, Tamworth, Staffordshire.
Rawson, Richard, Wheathill, Liverpool.
Wingfield, William (Master in Chancery), 73, Eaton Square.
Cotton, Benjamin, Afton House, Isle of Wight.
Hallett, John James, M.D., Upper Holloway, Middlesex.
Faulkner, C. F. Allen, Bury Barns, Burford, Oxon.
Neville, Ralph, M P., 5, St. James's Place, London.

The names of 22 candidates for election at the next meeting were then read.

The proceedings of the Council at this meeting were of a most interesting description, and in order to give the report of them as fully as circumstances will permit, we shall, in our present Paper, confine ourselves to the valuable remarks on the subject of *Ashes* and *Pipe Drain-tiles*, made to the Council by Josiah Parkes, Esq., the consulting-engineer to the Society; and in our next week's Paper conclude the report.

Guano and Ashes.—Mr. Hillyard having called the attention of the Council to the difference in the quality of ashes proposed to be mixed with the guano in the model experiment, Mr. Parkes apprehended that the quality of the ashes used by the different experimenters when mixed with guano might occasion discrepant results, as ashes alone were a manure, but of various efficacy, and the quantity of this substance proposed to be employed in the compost was large as compared with that of the guano. The ashes of different peats were well known to possess extremely variable properties and powers; some were comparatively rich, and others poor. The opportunities he had had of noticing the very feeble effects of peat-ashes derived from a particular bog in Lancashire had induced him to carbonise that peat, instead of burning it to ashes. He had found this charcoal dust to be a powerful fertiliser of the bog in question, although the application of ashes obtained from the same peat produced little else than weeds. He was of opinion that if all farm weeds, such as couch, and the cuttings of hedges, trees, &c., were reduced by charring instead of by incineration, that product might be more beneficial to soils and plants in general than the ash. He had charred the dried diggings of bog drains, &c., in clamps formed of peat sods; the operation was as simple as that of charring wood. Clay earth may be advantageously washed in the same clamps with the peat, and he had found the mixture produce excellent effects; but his experiments were principally confined to its use as a fertilizer of bog soil. He had procured some very pure peat-charcoal, and sent it to Mr. Graham for trial. There could be no doubt as to the value of the presence of carbon in soil, and charcoal is known to act both chemically and mechanically, with advantage to many soils. Charcoal, too, was perhaps the very best of all substances to absorb the urine of cattle, &c.

Pipe Drain-tiles.—Mr. Parkes produced some specimens of small cylindric pipes for drains, and desired to address a few remarks to the Council on the observances necessary to ensure complete success in their use. In all arts there were successful and unsuccessful operators, and failure was usually traceable to some neglect of necessary conditions, or precautions, when the many succeeded, and the few failed. In the isolated accounts he had heard or read of ill success with pipe tiles, he found that sufficient regard had not been paid to the proper form and dimensions of the excavation which was to receive them. It appeared, in these cases, that a perpendicular ditch (or nearly so) had been generally dug, many inches broad at bottom, to receive a pipe of small diameter; whereas, in Kent, and in the other counties which gave birth to this system, and where it had hitherto been most used, every one knew that the bottom of the drain should be formed of such size that the pipe may fit and fill it. The proper section of the trench was a wedge, being about 14 inches broad at top, tapering down to the diameter of the pipe at bottom, whatever might be the depth. The bottom was cleared out by a scope drawn towards the workman, having the same diameter, or nearly so, as the external diameter of the pipe. The particular tools used for forming the trench had already been described in the Journal (Vol. iv. p. 28). A series of pipes thus laid could not be disturbed, but there was nothing to ensure a true unbroken line of pipes, if they were laid in a trench of larger dimensions than themselves; and hence failure by stoppage would certainly arise. After diligent and extensive inquiry he had not heard of a single pipe-drain failing, in any respect, in the districts where this system of drainage has established itself; nor could he see any valid reason to object to it. The use of inch-bore pipes was rapidly extending, and he believed it to be the best and cheapest practice known. He had been enabled to demonstrate, in the most satisfactory manner, that an inch-bore pipe far more than sufficed to receive and carry off the water of rain, according to the usual system of parallel drains; these experiments would appear in the forthcoming Journal. He would now advert to an occasional cause of failure incidental to drains in clay soils, which he conceived to be attributable chiefly to insufficiency of depth. Clay is a substance which may be said never to be at rest; it shrinks and swells according to its state of wetness or dryness; a mass of clay soil is, therefore, in continual movement. In addition, it was well known that clays can only be drained through the instrumentality of cracks produced by their drying. If a drain or conduit be placed too near the surface, and the cracks descend below it, such a line of drain would be liable to derangement, particularly in parts of unequal tenacity, from the contraction and expansion of the bottom or floor, arising from its varying state of wetness or dryness. It was well known to builders that the foundations of a house in clay should be laid at a depth greater than the reach of the cracks, or at least as deep as their usual penetration. The force of expansion in clay, and of subsidence from contraction, was well known to produce fissures and rents in buildings. It was enjoined in old treatises on building, and he found it to be the practice about London, to sink foundations in clay four feet below the surface, and to drain them below that level. He considered that agricultural drains two feet or even two feet six inches deep, in clays, were subject to derangement, and even to stoppage, from this cause alone, and that their depth should not be less than three feet, or from that to four feet, where an outfall could be obtained. Deep drainage in all soils was also consistent with economy of outlay, as they may be placed further asunder, of which he had given several instances in Kentish practice, and now adduced others. He earnestly entreated the Members of the Society, who might be draining their farms, to reflect well on the advantages of deep over shallow drainage. Many persons had beneficially drained lands over again to a greater depth, which had been substantially drained 2 ft. and even 2 ft. 6 ins. deep, 30 to 40 years since. As regards continuous good action, he believed that deep drains would be much more durable than shallow ones, as they were removed below disturbance from the pressure of horses, carts, or implements. Also that deep drains were less liable to choke than shallow ones, as the water reached them better filtrated. He was of opinion that the sharp wedge-shaped form of the sides of the trench in which pipe-drains were laid, was eminently conducive to their durability, as the little pipe at the bottom was thereby protected from undue superincumbent pressure. The water entered such drains at the level of the floor in a thoroughly-filtered state, and the velocity of the current kept the line of pipes at all times clean; nor could any vermin enter them. He had heard of, or read, a statement that the floors of drains in clay soil became so soft, that tiles sunk in them, or that the bottom stuff was protruded upwards and choked them. It was likely this might occur when tiles were used without soles. It did not happen with pipe-drains. The opinion, indeed, prevails in Kent, that the floors of pipe-drains are drier and firmer than other parts of the field at the same depth. He had no doubt of the truth of this opinion, and it was confirmed by experiment as well as observation. It appeared that if a pipe of 1 inch bore, 12 ins. long, and $\frac{1}{4}$ inch thick, were hermetically closed at each end, and placed in water just covering it, it would become full of water by absorption in about five hours; and if hung up horizontally, it would let all the water pass out of it in about the same time. This experiment was first communicated to Mr. Parkes by Mr. Putland, of Saylherst, Sussex; and he had repeated it with nearly similar results. This fact, which is in strict accordance with the known porosity of unglazed earthenware, showed, that after the free water of rain had permeated a soil, and passed off through a drain, the pipes would still continue to act as absorbers of moisture, to some extent, from the earth in immediate contact with them; by which means, and in consequence of the indraught of air through the drain, it was reasonable to conclude that the earth adjacent to the pipes would become somewhat drier and harder after a cessation of rain than the more distant parts. This was an additional reason with him for the preference he had always given to tiles rather than to broken stones, or any other materials which filled a drain, as a free circulation of air was thereby better established; and it must be recollected that a drain served the double purpose of a conduit of water out of the soil and of air into it, the latter function being, perhaps, quite as important as the former.

In answer to inquiries from several members respecting the adaptation of small pipes to the drainage of soft soils and sands, Mr. Parkes showed, that by inserting a small pipe into a larger one (nearly fitting) for about a third of its length, or 4 inches, a perfect continuity, or chain of pipe, would be formed, which could never sink. It was well known that some of the most plastic and pure clays were troubled with what he might term faults; *i. e.*, sand-beds occurred. He knew of such at Mr. Handley's and other places, and in them the ordinary tile-stones, wood, &c., would sink, and the drain was thus marred. He would apply this arrangement of pipes as a perfect remedy in such spots, and even in much more unsound and troublesome bottoms; but it was clearly impossible to prescribe the exact mode of proceeding in every difficulty, as the particular case must be inspected, in order to know how to deal with it in the best manner.

(To be continued.)

FARMERS' CLUBS.

Mosspaul.—The Wisp Club.—The annual meeting of the Wisp Club took place here on the 19th ult. This club, which takes its name from a high range of hills in the counties of Roxburgh and Dumfriesshire, was established in the year 1826; its leading object is to ascertain and record the average prices of the cattle, sheep, and wool of the district during the past year—a species of statistical information most useful to both landlords and farmers, as will be readily perceived when we state that the farms are let, not at so much per acre, but at so much per head for the number of sheep grazed. The usual calculation is, that in the North Highlands five acres of pasturage are required for two sheep, whilst south of the Frith of Forth three acres will carry two sheep. Scarcely any hill pasture in Scotland, in its natural state, will carry one sheep to the acre. The extent of land thus occupied by many farmers is immense,—many of them counting "hirsels" to the number of from 3000 to 5000, and even 10,000, whilst some go much beyond this; Cameron, of Corriehoyle, for instance, whose holding lies in the Lochiel country and away by Glencoe, counts his 40,000 bleaters on the wild mountain sides and deep valleys of the far north. Mr. Cameron, who was once a common drover, may thus be reckoned as, next to Prince Esterhazy, the greatest flock-master in the world. Farms of the kind of which we are speaking, are nearly all let upon leases of nine or thirteen years, whilst the leases of the arable farms in Scotland run from 15 to 19 years. The locality of Mosspaul is wild, stony, and rugged—the Wisp itself rising immediately behind the inn, to a height of 1950 feet above the level of the sea, whilst "Alps upon Alps arise," all around, closing in a narrow valley, at the foot of which there runs a mountain stream called the Ewes, and along which lies the road to Edinburgh, hemmed in on each side by immense hills which rise almost perpendicularly, and strongly remind the passenger of the accounts he has read of the far-famed Khyber Pass. The inn of Mosspaul itself, a solitary dwelling amidst the mountains, stands at an elevation of 620 feet above the level of the sea, and is built on the very confines of Roxburghshire—the stables, barns, &c., which adjoin being in the county of Dumfries. For miles and miles around and along the road, the property is owned by the Duke of Buccleuch, and is divided into holdings, such as we have already indicated—many of the farmers being owners of from 3000 to 5000 sheep. The members of the Wisp Club are mostly pastoral farmers, and may be reckoned amongst the most substantial men of their class in the several counties of Dumfries, Roxburgh, Selkirk, Peebles, &c. Its meetings are held at Mosspaul in the spring of the year, and one of its rules directs that a record shall be made of "the average prices obtained the preceding season for one and two-year old short-horned Galloway cattle, all descriptions of Cheviot and black-faced sheep, and their relative wools, produced in Scotland south of the Frith of Forth." Each member is required to state what he conceives to have been the average prices of the season, and the prices named by the majority are recorded in the secretary's book. The following is a copy of the prices for 1842 and 1843:—

	1842 £	s.	d.	1843 £	s.	d.
Short-horned stirks (each)	5	0	0	5	5	0
,, two-year olds	8	10	0	7	15	0

—*Carlisle Journal.*

Westfirle.—At the last meeting of the Westfirle Farmers' Club, the subject for discussion was, The Best Method of Turnip Culture. The Chairman, Mr. G. Ellman, said that having proposed the subject it was his duty to open the evening's discussion. He considered it by no means the least essential point that the ground intended for Turnips should be well prepared; he would broad-shear the land as soon as harvest was over, in preference to ploughing it in the common way, as the furrows being laid up so high have a much greater chance of drying in the spring than if ploughed plain, and come to hand much more readily, affording more crumb, which is so essential to Turnip culture, as keeping the ground loose and at the same time moist, without being waterbound under the furrow, which he thought should always, if possible, be avoided. As to the number of times the ground should be ploughed, that must depend on the soil, which should never be ploughed in wet weather. The sort of manure best to be applied he should leave to them to decide that evening. He had had good Turnips by using bones, soot, and bran, where the expense of carting heavy manures was too great; but within a moderate distance of the dung yard he very much preferred using good rotten dung, as more beneficial to succeeding crops than the best artificial manures.—The system of a member, who said that he always had good Turnips, was to plough frequently, and to furrow the land up to allow the water to run off, and to carry out his manures during a frost; if the land was clean he was then sure of Turnips. He was of opinion no one would use bone dust if he could get good yard manure.—A conversation here ensued as to the value of bones applied in their raw state, or after they were boiled; and it appeared to be the opinion of the meeting that in their natural state the oil preserved them for a considerable time, so that they were of no immediate value to the crop; but in their manufactured state they decayed more easily, and, of course, were of more value to the land, especially if wet ensued, which would hasten their decomposition.—The Chairman said he had tried 20 bushels of Clark's black manure upon an

acre and a half. The field was sown with Rape, and the crop was quite equal to the other part of the field, which was manured with dung and mould.—*Sussex Agricultural Express.*

Crieff.—Professor Johnston delivered two interesting lectures here lately on the Composition of the Soil, and on the Use of Manures. The following are short extracts:—By a geological map and analytical tables, the Professor illustrated the composition of soils, entering into a detailed account of the substances found in them, and in the crops they produced; thus showing that a soil might be quite capable of producing one sort of crop, while inadequate to produce another. Soils often contain noxious matters, such as oxide of iron, &c., in too great quantity, rendering them barren; and he instanced a district in Fife, that he had visited some days before, where the crops for a time succeeded well, but at a certain stage of their growth suddenly gave way, and on examining the subsoil he found it impregnated with oxide of iron, and thus whenever the roots of the plants penetrated the subsoil they were poisoned. Though the soil should appear dry, he recommended draining and subsoil ploughing as the cheapest way to get rid of such noxious matters. Professor Johnston well illustrated the relation between the soils and the crops they produced, showing that however small the inorganic substances the crops contained, yet they were just as requisite for the maturing of the plant as the glue and the nails, though small in bulk, were necessary in the construction of a box. The application of manure, therefore, its kind, amount, and the frequency of it, must depend upon the presence or absence in the soil of the chemical substance referred to, and the kind of crop to be raised, so that there may be given to the land the elements that the crop requires. In his second lecture, the Professor spoke of the exhaustion of the soil. Whether by a succession of different crops, or by a succession of a particular sort of crop, the elements forming the crop will show the elements that have been taken from the soil, and which it will be necessary again to add, in order to restore it to a condition of fertility. But the soil may also be exhausted otherwise than by cropping. A considerable number of the substances composing the soil, such as potash, chlorine, &c., are soluble in water; and hence it will be manifest that the rain must wash much of these elements away. By means of draining, the rain, instead of trickling away over the surface of the soil in a few channels, is diffused equally through the ground, carrying with it to feed the crops the substances that would otherwise be carried away and lost. The waste of manure from other causes was then alluded to. It is notorious that, under the present mode of managing it, the rain washes a great portion of the soluble substances of farm-yard manure out of it; the waste thus needlessly encountered is greater than the advantage gained from all the guano used in this country. The portion of the manure so lost would, if it were saved, and converted into grain, be more than equal to the value of all the foreign Corn that is annually imported into this country.

Miscellaneous.

Good Farming.—It may be laid down as a standing rule, and as a guide to direct our exertions, that all good farming, the whole of that process by which bad land is to be converted into good, or land naturally good and productive is to be continued in that state, is comprised in the three following operations of husoandry. 1. To carry off all stagnant and superfluous water by means of judicious draining. 2. To return through the medium of manure, the strength and fertility which has been extracted from the land by cropping. 3. To eradicate all noxious weeds, that the strength of the manure may be thrown into the crops and not into the weed.—*Rawstorne's Remarks on Lancashire Farming.*

We understand, in reference to the *Yorkshire Land-Draining Association*, that an amply sufficient amount of stock is already taken to insure the commencement of active operations at the earliest opportunity, and that the applications are daily increasing.

Notices to Correspondents.

Rural Chemistry. By Edward Solly, Esq., F.R.S., Experimental Chemist to the Horticultural Society of London, Hon. Mem. of the Royal Agricultural Society, and Lecturer on Chemistry at the Royal Institution, has been reprinted from the *Gardeners' Chronicle*, with additions, and may be had of all booksellers, price 4*s*. 6*d*.

Bone-bruising.—*W. H., Reading.*—The paragraph you send is extracted from a previous No. of the *Agricultural Gazette.*

Bone-dust and Sulphuric Acid.—*H. C. Shomberg.*—To fine bone-dust apply about half its weight of sulphuric acid, and dilute it with its volume of water. See an article by Mr. Lawes on this subject a few weeks ago.

Buttercups in Pastures.—*Cheshire Farmer.*—We do not know for certain any plan of eradicating these weeds, but we have *heard* that geese will root them up to feed on them, and that depasturing with geese is a cure for them. Can any of our correspondents inform us on this subject?

Coltsfoot.—*Atticus.*—There is no off-hand way of eradicating it. Perseverance in pulling the flowers, and hoeing up the leaves as deeply as possible, will ultimately prove successful in destroying it.

Food for Cows.—*E. Barnard.*—The Swedish Turnip is more nourishing than the Mangold Wurzel, but it is apt to taint the milk; and therefore you had better give your cows the latter. Apply wood-ashes as a manure for Turnips. The more vegetable the mould on which these roots are grown, the greater the effect the ashes will have. Guano is deficient in alkali, and will be greatly improved by mixture with wood-ashes. 8 cwt. of a mixture of equal weights of the two will be more productive if spread equally over two acres than 4 cwt. of each separately on the same extent.

Hints about Guano.—*W. M. F.*—Thanks for your published account. Where were these experiments tried? and by whom?

Implements.—*T. Baynton.*—Thanks. We may publish your information hereafter, when on the subject of Agricultural Mechanics.

Manure.—*J. C. T.*—Get all your manure into a heap, made as hard as possible by the carts employed in bringing it together wheeling over it every time, and cover it all up with a coat of vegetable earth, about 4 inches thick. It may more perfectly secure your heap if you mix this earth, when wet, with powdered gypsum before applying it. By all means apply the manure to the land in autumn, and plough it in deeply then, rather than keep it till spring.

Peach-shoots.—*W. K.* asks, Are the young shoots of Peaches and Nectarines injurious to cattle? Probably; for they yield prussic acid in abundance.

Professor Johnston.—*G. T. R.*—Thanks: you will see your communication has been anticipated.

Soot.—*R. P.*—It will not injure by keeping, but you will injure it by mixing lime with it. The best way of using it, unless by previous experiment you have ascertained that it is successful alone, is to mix about 20 bushels per acre with as many cubic yards of manure, and apply it in that way to Turnips, Carrots, and Parsnips, about which you ask. It contains the sulphate of ammonia, and *therefore* is a source of suitable food to all crops; and if a sufficient supply of that food is not afforded otherwise its application will be beneficial. Plants, however, require other food besides that which is afforded by soot, and therefore it *may* be unsuccessful as a manure, unless accompanied by other kinds of vegetable food, such as are found in ordinary farm-yard manure.

Steeping Seeds.—*Dupe.*—Was it *our* advice that you followed? We acted according to it ourselves, and the Wheat so treated now looks blooming.

Tares.—*X. Z.*—Sow them early in July, to be ready at the time you specify. Use farmyard manure, or if you have it not, apply 2 cwt. of guano and 3 or 4 bushels of old wood-ashes mixed together, per acre. About Beans, see a Leading Article in a March Number of the *Gazette.*

Turnip-Fly.—*New Subscriber.*—Mr. Forehead Singer would add to the obligation conferred on our readers by his letter on this subject (page 284) if he gave us a description and account of the cost of his machine for sowing the lime.

Miscellaneous.—We have to apologise to three correspondents for delaying answers to their questions.——*A. B.*—If he looks again at the article to which he alludes by a "Farmer and Valuer," he will see that any speculative statements are carefully avoided; this was purposely done. Those he has made are from practical experience in valuation. A Norfolk farmer has ably dealt with the produce of the farm, but *if* it is *possible* to come at the actual amount sold off by the out-going tenant, the "Farmer and Valuer" will, at some future time, be most happy to supply it to the Editor.——*G.*—We are sorry we have not got a Paper of the Number you ask for.

*** As usual, many communications have been received too late.

Markets.

MARK-LANE, Monday, May 13.

Having a good supply of English Wheat from the near counties this morning, Factors were unable to make any progress with sales, until a reduction of 1*s*. per qr. was submitted to upon the finest qualities, and 2*s*. upon secondary descriptions; notwithstanding which, few stands were cleared at the close. Old Foreign met a fair consumptive demand at last week's prices—the new generally comes in too bad condition to admit of its disposal.—English Barley must be written 1*s*. cheaper. Foreign was little inquired for, and held at our quotations.—Beans and Peas are each 1*s*. dearer.—Oats are generally held for late prices, but having a large supply, where vessels are coming on demurrage a trifling reduction is necessarily made to clear them.

BRITISH, PER IMPERIAL QUARTER.	*s.*	*s.*		*s.*	*s.*

Friday, May 17.

The supplies of Wheat, both English and Foreign, during the week have been large, and the trade is dull at Monday's prices, with a limited extent of business.—Having a large supply of Foreign Barley, and much of the Danish being in bad condition, it sells slowly, and barely maintains its late value.—Beans and Peas are unaltered.—The show of Oats is large, and quotations scarcely supported.

Kingsford and Lay.

HOPS, Friday, May 17.

Since last week the accounts received from the Hop plantations state that the Hop-fly has gradually increased, and this morning's letters say from 10 to 15 are now easily to be found on a leaf; so early and general an attack has seldom occurred without producing a decided failure in the crop: our Market in consequence has advanced 4*s* to 6*s* per cwt. on all sound Hops of last year's growth, and from 8*s* to 12*s* on choice Sussex. On account of that district altogether escaping blight, they have been more sought after by consumers through the season, and are now exceedingly scarce in the Market. The following is our present quotation of prices:—

Mid & East Kent Pocks.	8*l* 0*s* to 10*l* 10*s*		Sussex Pockets . .	6*l* 6*s* to 6*l* 15*s*

Weald of Kent Pocks.	6 6	6 15	Farnham . . .	9 9	10	10
Choice ditto . .	7 0	7 7				

Patteneden & Smith, Hop-Factors.

WOOL.—British, Friday, May 17.

The English Wool Market continues quiet; there is an average amount of business being done, but prices continue pretty nearly stationary. The appearance of the new clip in the Market is looked forward to with some anxiety; great caution will be necessary on the part of Staplers to prevent prices from ranging too high at first, which, should it happen, will tend to the injury of the trade, as, with the present prospects, we think that the Manufacturers will find it more advantageous to work shorter time than give materially advanced prices for Wool.

	per lb.			per lb.

Southdown Fleeces	11	1 0			

James Peabby, Wool Broker.

COVENT GARDEN, May 18.—Notwithstanding the long dry weather the market is well supplied with most articles, but trade is not brisk. Pine-apples are offered at nearly the same prices as mentioned in our last report. The best hothouse Grapes are selling at about 12*s*. per lb.; besides these there are also a few Spanish ones in the market. Apples and Pears are becoming very scarce; the best Kitchen Apples bring about 12*s*. per bushel. Gooseberries are supplied in considerable quantities, and a few green Currants are in the market. Oranges are getting scarce, and they are somewhat advanced in price. Little alteration has taken place in the price of Strawberries; they are good in quality, and are becoming plentiful. Vegetables of all kinds are good. Lisbon Potatoes are imported in considerable quantities; they are very good in quality. Brocoli is scarce, and is a little advanced in price; the dry weather begins to affect it as well as Cauliflowers, which are also dearer. Cabbages are sufficient for the demand, and Carrots and Turnips are plentiful. Greens are much the same as last week; as is also Rhubarb. Seakale gets scarce, and French Beans are considerably advanced in price; Asparagus is likewise on the rise. Green Peas have been abundantly supplied during the week. Lettuces and other salading are sufficient for the demand. Cucumbers are nearly the same as last week; they are, however, generally speaking, small in size. Cut Flowers generally consist of Erica hybrida, E. rubra-calyx, Cactus speciosissimus, Gardenia radicans and florida, Epacris grandiflora, Scarlet Pelargoniums, Verbenas, Fuchsias, Calceolarias, Pansies, Auriculas, Cinerarias, Lily of the Valley, Moss, Provence, and China Roses.

FRUITS.

Pine Apple, per lb., 6*s* to 12*s*	Lemons, per doz. 1*s* to 2*s*

— per bushel, 1*s* 6*d* to 3*s*	Celery, per bun., 6*d* to 1*s*
— Kidney, p. bush., 2*s* 6*d* to 3*s*	Mushrooms, per pottle, 9*d* to 1*s* 2*d*
Frame Potatoes, 6*d* to 1*s* 6*d* per lb.	Small Salads, per punnet, 2*d* to 3*d*
New Turnips, 6*d* to 1*s* 6*d* per bunch	Watercress, p. doz. sm. bun. 4*d* to 6*d*
Turnips, per doz. bunches 1*s* to 2*s*	Parsley, per hf.-sv., 6*d* to 1*s*
Peas, per peck, 2*s* 6*d* to 3*s* 6*d*	Tarragon, Green, per bun. 3*d* to 4*d*
Red Beet, per doz., 6*d* to 1*s* 6*d*	Green Mint, 2*d* to 4*d* per bunch
New Carrots, 9*d* to 1*s* 6*d*	Marjoram, p. bun. 4*d* to 6*d*
Radishes, Tur., 6*d* to 1*s* p doz. bchs.	Chervil, per punnet, 2*d* to 3*d*
Basil, 4*d* to 8*d* per bunch	Cauliflowers, 6*s* to 24*s* per doz.
Horse Radish, per bundle, 1*s* to 6*s*	

POTATOES.—Southwark Waterside, May 13.

We have nothing of moment to notice in the state of our Market during the past week. The weather continues very dry, and we learn that the early Peas on gravelly land have suffered severely by the drought; there has been two slight showers of rain, but we are afraid that it has not been of much service to the parched ground. Notwithstanding, our Market remains inactive, and the best samples moved off tardily at the terms of this day week; but the middling conditioned sorts met a dull sale, although offered at further reduced prices. Whites from Holland, Belgium, and Ireland are still in the Market, selling from 40*s* to 45*s*. The supplies have been moderate, principally from the northern districts, but are fully equal to the demand.

— fine . .	65	75	— fine	100	105	

Smithfield, Monday, May 13.—Per stone of 8 lbs.

Best Scots, Herefords, &c.	3*s* 6	to	3*s* 10	Best Downs & Half-breds	3*s* 6	to	3*s* 8
Best Short Horns .	3 2		3 6	Best Long-wools . .	3 2		3 6
Second quality Beasts .	2 10		3 2	Ewes and second quality	2 0		3 4
Calves . . .	4 0		4 8	Pigs	3 0		3 8
Lambs . . .	5 0		6 0				

Beasts, 3105; Sheep and Lambs, 30,430; Calves, 121; Pigs, 330.

There is a very large increase in the supply of Beasts to this day's Market, which has caused a considerable reduction in price; many remain unsold, notwithstanding the willingness to submit to the above-quoted much lower rates. The quantity of sheep is also greater, but we do not think the weight of Mutton much increased, as the Market is largely composed of small and half meated Sheep; we are obliged, however, to submit to a reduction of about 2d per 8 lbs in most things; small Sheep of very good quality in many instances rather exceed our highest quotations;—our prices have reference now only to Sheep out of the Wool. Lamb is rather lower. Veal and Pork remain steady.

Friday, May 17.

Our prices for everything have rallied a little to-day, the supply being but moderate. The best Scotch, &c., are making very close upon 4*s* per 8 lbs, and best Short-horns nearly 3*s* 8*d*. Sheep and Lambs have fully recovered the depression they experienced on Monday, and may be quoted best Downs 3*s* 10*d*, and best Longwools 3*s* 8*d*, and other qualities in like proportion. Some of the best sizeable Lambs are making 6*s* 4*d*, but the average price cannot be stated at more than 6*s* for the best. Calves are rather dearer, the best realising 5*s* per 8 lbs.

Beasts, 744; Sheep and Lambs, 8500; Calves, 260; Pigs, 430.

41, West Smithfield.

PRINCIPAL MANURES.

Weight per bush., about lbs		Weight per bush., about lbs	
Alum, 240*s* per ton	—	Phosphate of Ammonia, in fine powder, 28*s* per cwt.	65

Expenses of shipping about 5*s* to 7*s* per ton, according to quantity.

Mark Fortnight.

IRON WORKS.

COTTAM AND HALLEN, WINSLEY-STREET, OXFORD-STREET, LONDON.

GARDEN ROLLERS and RICK-STANDS, or STATHELS, at very low prices.

GARDEN SYRINGES, 9*s.* 6*d.* each.

HAND-GLASS FRAMES for Cucumbers, &c., 18 inches square, 20 inches, and 22 inches.

CAST-IRON FLOWER-STAKES, 4 ft. long out of the ground, 4 ft. 6 in., 5 ft., 6 ft., and 7 ft.

Watering-pots, Garden Engines, Mowing Machines, Garden Chairs, Superior Garden Tools of all kinds, Garden Vases in great variety, and every description of article used in Horticulture.

BEST WIRE, for STRAINED WIRE-FENCING, at 8*s.* 6*d.* per bundle of 150 to 160 yards each.

Flower-bordering, Trainers, Garden Arches, Flower-stands, Rose-tree Guards, and every description of Ornamental Wire-work, for Gardens, &c.

HOTHOUSES, CONSERVATORIES, &c., made upon the most improved principle, either of iron or of iron and wood combined, which can be fixed complete in any part of the Kingdom, at very low prices.

HOT-WATER APPARATUS for heating Hothouses, Conservatories, and Greenhouses; Churches, Public or Private Buildings, &c., with COTTAM'S PATENT, or ROGERS'S BOILERS. After 15 years' experience, and having fixed upwards of 1500 Apparatus for the above-mentioned purposes, and by various improvements which they have made during that time.

RENDLE'S TANK SYSTEM on an improved simple plan.

Show Rooms at their Manufactory, No. 2, Winsley-street, where estimates and every information may be obtained.

COTTAM AND HALLEN, AGRICULTURAL IMPLEMENT Makers, &c. 2, Winsley-street, Oxford-street, London.

DOUBLE-MOTION HAYMAKERS of the best construction, made almost wholly of iron, and containing the double Cylinder, and all the latest improvements, are now ready.

CAST-IRON RICK-STANDS and PIGTROUGHS, at very low prices.

IRON HURDLES AND FIELD-GATES of all sizes, at exceedingly low prices.

PLOUGHS, DRILLS, Sheep and Cattle Weighing Machines, Improved Prize Harrows, Field Rollers, Turnip-cutters, Chaff-cutting Machines, Threshing and Winnowing Machines, Oil-cake Breakers, and every description of Implements used in Agriculture.

Show Rooms at their Manufactory, 2, Winsley-street, Oxford-street, where every information may be obtained.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

RENDLE'S TANK SYSTEM OF HEATING.

STEPHENSON AND CO., 61, Gracechurch-street, London, Inventors of the IMPROVED CONICAL and DOUBLE CYLINDRICAL BOILERS, having been much engaged in heating buildings upon the above system with Tanks of various materials, solicit the attention of scientific Horticulturists to an Iron Tank now fitting up on their premises, which offers most decided advantages over every other article hitherto employed for the same purpose. These tanks, which are ornamental in appearance, can be made from 10 to 100 feet long and of any width and depth, and can be connected or disconnected by any working Gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of employing this much approved method of heating without the assistance of Engineers. The Tanks can be applied to Boilers and Pipes already fixed, and from the present low price of Iron will be found cheaper than of any other material. MR. RENDLE, of Plymouth, has kindly undertaken to receive orders and furnish information to any persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

MANURES.

BOAST AND Co.'s PATENT INORGANIC MANURES.—These strong and productive manures have already proved their superiority over all others yet adopted. It is now thoroughly understood and acknowledged by intelligent agriculturists that each plant requires a distinct manure, and it is upon this perfectly scientific principle that these manures are prepared, being formed so as to supply all the substances taken from the soil by each particular crop. They are immeasurably more efficacious, far more economical than all others, and possess the great advantage of being easily applied to the land.

Prospectuses, with full particulars, may be obtained; or will be forwarded by post on application at the Manufactory, Bow, Middlesex.

*** By the use of these Manures, any land may be rendered fertile. Wheat, &c. may be grown on the same land every year with immense advantage to the farmer, and without injury to the soil; whilst all the other crops are greatly increased.

GUANO, superior to the foreign, at a reduced price.

Manures prepared expressly for Gardeners and Florists.

TURNIP SEASON.

GUANO (Foreign and Potter's), RAPE-DUST, BONE-DUST, CLARKE'S COMPOST, and all other MANURES for the TURNIP CROP, to be had on the best terms, of MARK FOTHERGILL, 40, Upper Thames-street.

GUANO (GENUINE PERUVIAN & BOLIVIAN) ON SALE, BY THE ONLY LEGAL IMPORTERS,

ANTONY GIBBS AND SONS, LONDON;

WM. J. MYERS AND CO., LIVERPOOL;

And by their Agents,

COTESWORTH, POWELL, AND PRYOR, LONDON;

GIBBS, BRIGHT, & CO., LIVERPOOL and BRISTOL.

47, Lime-street, May 16, 1844.

TO GARDENERS AND AGRICULTURISTS.

SUPER-PHOSPHATE of LIME is capable of producing a more rapid vegetation in Plants than any substance known. It may be had at Mr. LAWES' Factory, Deptford Creek, price 7*s.* per cwt. Phosphate of Potash, 15*s.* per cwt.

" Soda 12*s.* "

" Magnesia 9*s.* "

" Ammonia 1*s.* per lb.

*** Super-phosphate of Lime in a concentrated form may also be procured of Messrs. WARNER, 28, Cornhill, and other Seedsmen, in 7 lb. packets, price 1*s.*

FOR TURNIPS.

THE Urate of the London Manure Company, 4 guineas per ton. The London Manure Company have great pleasure in acquainting their friends that they have this day reduced the Urate from 5*l.* to 4 guineas per ton, at the same time pledging themselves that the quality shall be fully maintained. The Urate will be found most valuable for Turnips, by promoting a rapid growth; it secures a full plant, at the same time producing a great weight per acre, and extending its beneficial effects to the succeeding crops. It may be sown broadcast, or, which is preferable, by the drill, at the rate of one ton to 3 acres; and it is desirable it should not be placed more than 2 inches below the surface. Gardeners and Florists will find it very useful for Dahlias, and other roots. Full particulars and testimonials will be forwarded on application. Genuine Peruvian Guano; Phosphate and Sulphate Ammonia; Gypsum, and every other artificial manure.—EDWARD PURSER, Secretary, 40, New-bridge-street.

MOST IMPORTANT TO FARMERS AND GRAZIERS.

GIBBONS' DISINFECTING OINTMENT, a most effectual and perfect cure for Epidemic and Foot-rot in Sheep; also for Epidemic and Foul in Cows' Feet, and for the Grease and Thrush in Horses; prepared only by HENRY GIBBONS, Agricultural Chemist, Wolverhampton.

This Ointment effectually destroys the American grub on Fruit-trees. Sold by all respectable Druggists in Town and Country, in packets at 2*s.* 6*d.* each. Mr. William Bailey, Manufacturing Chemist, North Street, Wolverhampton, is appointed Sole Wholesale and Shipping Agent.

DR. HALLETT'S LIQUID FERTILISER.—The beauty of Flowers, with their power of perfecting their Seeds, and the flavour and size of Fruits and Vegetables, must ever depend upon the food supplied to the plants producing them, and these a very extensive series of trials on various soils has shown, may be secured by the use of Dr. HALLETT'S CONCENTRATED LIQUID FERTILISER, which contains all the essential ingredients of the best foreign Guano, with others equally so, but not to be found by Sea Fowl, in the Atlantic Ocean. Sold at Mr. G. HALLETT'S Factory, Broad Wall, Blackfriars; Messrs. WINSTANLEY'S, Chemists, 7, Poultry; Messrs. WARNER'S, 28, Cornhill; Messrs. HURST and M'MULLEN'S, 6, Leadenhall-street; and every respectable Chemist's and Seedsman's, with directions, in stone quarts, at 1*s.* 6*d.* each, and in bottles, six times the size, at 7*s.* 6*d.* The quart requires 32 gallons of water to reduce it for use, for watering soils and growing bulbs in.

IMPORTANT TO AGRICULTURISTS AND OTHERS.

ANALYSES OF SOILS, MANURES, &c. are conducted by MR. MITCHELL, Analytical Chemist (late of the Royal Polytechnic Institution), No. 5, A., Hawley Road, Kentish Town.

N.B. Gentlemen instructed in Agricultural Chemistry. The course will comprehend the Elements of Analysis.

WRIGHT'S STACK PRESERVER.—Hundreds of Stacks of fine Hay were saved from spontaneous combustion or discoloration in the neighbourhood of the inventor, by the use of the above invaluable instrument. The article may be seen, and bills obtained, containing testimonials to its value from experienced Farmers who have for many years proved its efficacy, at J. WRIGHT'S, Manufacturer, Ongar, Essex; J. and G. DEANE, Ironmongers, London-bridge; and of any Ironmonger in the country. Price, in box, with lock and joints, 2*l.* 5*s.*

CLEAR WHITE GLASS MILK-PANS.

APSLEY PELLATT, FALCON GLASS WORKS, Holland-street, Blackfriars-road, having made further experiments, is able to reduce the price of the Milk-Pans—as described in the *Gardeners' Chronicle*, of clear white flint glass, which is far superior to the foreign green glass—to 5*s.* 6*d.* each, or 3*l.* per dozen.

PULVERISED PURE CHARCOAL for Mixing with COMPOSTS. The above can be had in bags, containing four bushels, at 5*s.* per bag, including bag, and carriage, paid to London. — Apply to JOHN RIVERS, Sawbridgeworth, Herts.

YORKSHIRE LAND-DRAINING ASSOCIATION. Capital, 500,000*l.*, in Stock of 25*l.* Deposit 5 per Cent.—The Provisional Committee have determined to limit the time for receiving Applications for Stock in this Association to THURSDAY, the 30th instant, on which day the List will be closed, preparatory to the allotment being made. Prospectuses may be obtained from the Solicitors, Messrs. Blanchard, Richardson, and Gutch, York; or from the Secretary, J. H. CHARNOCK, Wakefield.—May 16, 1844.

GLASS SUPERSEDED FOR HORTICULTURAL PURPOSES BY

WHITNEY'S CHEMICAL, TRANSPARENT, WATERPROOF COMPOSITION, for rendering Muslin, Calico, or Linen, for the Frames of Greenhouses, Pine, Melon, or Cucumber Stoves, &c., impervious to Rain or Moisture, admitting light equal to Glass, the *burning* rays of the *sun alone* being obstructed. Houses or pits covered with Calico, &c., prepared with this Composition, embrace important advantages over Glass. The light being equally diffused in every part of the house, plants placed on the floor have as much light as those close to the covering, consequently they are not drawn up as under Glass, while they continue much longer in *bloom*, and preserve their *delicate tints unfaded* till the *blossom falls*.

Whitney's Substitute for Glass.—I have had screens of calico rendered transparent with Mr. Whitney's invaluable varnish, and used them last winter, with a success far exceeding my most sanguine expectations, though my anticipations had been considerably excited. Indeed I consider Mr. Whitney's discovery as an invaluable boon to the horticulturist, one that will bear competition with any invention connected with the art and mystery of Horticulture in modern times. My screens were about 9 feet long each, and were inclined to the wall separated about 12 inches below, and as my object was to ascertain the value of the screens, in reference to *radiation*, they were *left open at each end*. Suffice it to say, the Fuchsia, Pomegranate, Passion-flower, Japan Honeysuckle, and others still more delicate and susceptible, were effectually preserved, and that without the slightest check to their growth, or any injury whatever. I am of opinion that in this *new aspect*, it possesses a protecting influence *infinitely superior to glass*, because the effects of radiation, a most powerful source of cold, are *not intercepted by glass*, which so materially counteracts the artificial temperature within; I cannot, therefore, but conclude, that for the protection, not merely of the early blossom, but the maturation of the fruits as in the case of the Peach, Nectarine, Apricot, and Grape, these transparent screens, thus prepared, are invaluable, and their triumphant success certain. Add to this, for Cucumber and Melon frames, their superiority over glass is undoubted for preventing flagging of the foliage (sometimes being scorched) by day, and the chilling effects of radiation by night. Screens prepared with Whitney's Transparent Varnish should be also used as shades in the intensity of a summer's sun, and for protection against radiation in winter, for the stove, greenhouse and conservatory. Even in the *economy of fuel* the value of such screens is demonstrable, as less will be required to maintain an equable warmth, its escape by radiation being thus effectually checked.—J. M., 16*th April*, 1844.

Prepared by GEORGE WHITNEY, Chemist, Shrewsbury; and sold in Bottles, 2*s.* 6*d.* and 4*s.* 6*d.*, with ample directions for use; and, as a protection to the public, the signature of the inventor is on each bottle. Sold by the principal Seedsmen in London and throughout the kingdom. Merchants, Seedsmen, and Florists supplied by Mr. Bailey, North-street, Wolverhampton.

DR. HALLETT'S DRY SOLUBLE FERTILISERS, are composed of all the useful ingredients of the best Foreign Guano, which manure is already nearly exhausted, and no two parcels of which were ever alike. They contain also other ingredients equally useful, and are always to be produced of uniform strength; they are improvers of all soils, but most so of poor ones, and cannot possibly prove injurious to soil or crop, as they contain no heating or caustic materials, being simply and purely Fertilisers. Five cwt. of either of them is equal to nearly 30 tons of horse manure as a Fertiliser. They are used, the one for all the varieties of Corn, Peas, Beans, Chicory, &c., and the other for Turnips, Mangold Wurzel, Natural and Artificial Grasses, and all Gardening purposes. This is the best protector yet discovered against the Fly in Turnips, for it gives a first growth three weeks beyond that of any other known Manure. Price of each Fertiliser, 10*l.* per ton, or 12*s.* per cwt.

Sold by Mr. FOTHERGILL, 40, Upper Thames-street; and Mr. G. HALLETT, at the Factory, Broadwall, Blackfriars, London. The Fertilisers are manufactured under the immediate inspection of J. J. HALLETT, M.D., &c.

Agents for London, Messrs. WINSTANLEY, Chemists, 7, Poultry; Suffolk, Mr. W. REVANS, Yoxford; Norfolk, Messrs. BULLARD and WATTS, Norwich; Jersey, Mr. C. Kruger. Respectable country agents wanted.

SOUTH HAMS AGRICULTURAL ASSOCIATION.—The Sixth ANNUAL MEETING and CATTLE-SHOW of the above Association will be held in the Barrack-Yard at Modbury, on WEDNESDAY, the 5th day of June, 1844. For List of Premiums, Regulations for Entry, Certificates, and other particulars, application is to be made (free of expense) to Mr. KELLY, the Secretary, at Modbury.—May 16, 1844.

RAMS FOR RAISING WATER WITHOUT LABOUR, WHERE A FALL CAN BE OBTAINED,

FOUNTAINS of every description. Specimens of the Fountain to be seen at the above address.

Also a Ram fixed on the premises. F. ROE, 70, Strand, London.

Every kind of Garden and other Pumps, Well Engines, &c.

BURBIDGE AND HEALY'S COOKING APPARATUS, combining Sylvester's Patents.—This Cooking Apparatus is believed to possess greater general advantages than any yet submitted to the Public, both as regards strength of material and workmanship; in fact, the laws of heat are so applied as to produce the greatest effect with the least consumption of fuel, without destruction to the Apparatus; and B. and H. can safely recommend it from experience, as unquestionably superior to anything of the kind hitherto made. A Prospectus can be forwarded, upon application, detailing particulars and prices, to 130, Fleet-street.

METCALFE'S NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most effectual and extraordinary manner, and is famous for the hairs not coming loose—1*s.* An improved Clothes Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh Brushes, of improved graduated and powerful friction. Velvet Brushes, which act in the most surprising and successful manner. The Genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE'S Sole Establishment, 130B, Oxford-street, one door from Holles-street.

Caution—Beware of the words "From Metcalfe's," adopted by some houses.

NECESSARY PRECAUTION.—CONSUMERS of BRANDY are respectfully informed that J. T. BETTS, jun. and Co. will not be responsible for any bottled Brandy that is not protected against fraudulent substitution, by the Patent Metallic Capsules, embossed with the words, "Betts's Patent Brandy, 7, Smithfield Bars." Sold by the most respectable Wine and Spirit Merchants, in Town and Country, at 3*s.* 6*d.* per bottle, the bottle included.

NEW BOOKS AND NEW EDITIONS

PUBLISHED BY

JOHN W. PARKER, LONDON.

PRACTICAL CHEMISTRY for FARMERS and LANDOWNERS. By JOSHUA TRIMMER, F.G.S. 5s.

By the same Author, 8vo, with 200 Illustrations. 12s.

PRACTICAL GEOLOGY and MINERALOGY, and the Chemistry of Metals. With an Introductory Discourse on the Nature, Tendency, and Advantages of Geological Pursuits.

THE DOMESTIC GARDENER'S MANUAL; being an Introduction to Practical Gardening, on Philosophical Principles; to which is added, a NATURALIST'S CALENDAR, and an Appendix on the Operations of Forcing, including the Culture of Vines in Pots. By JOHN TOWERS, C.M.H.S. Second Edition, Enlarged, One large Volume, octavo, 13s.

PRACTICAL BEE-KEEPER; or Concise and Plain Instructions for the Management of Bees and Hives. By JOHN MILTON. 4s. 6d.

REPORT of SPECIAL ASSISTANT POOR-LAW COMMISSIONERS on the EMPLOYMENT of WOMEN and CHILDREN in AGRICULTURE. Presented to Parliament, by command of Her Majesty. Octavo. 3s. 6d. each.

A FAMILIAR HISTORY of BIRDS; their Nature, Habits, and Instincts. By EDWARD STANLEY, D.D., F.R.S., Lord Bishop of Norwich. Third Edition, with Illustrations; two volumes, 7s.

DOMESTICATED ANIMALS, considered with reference to Civilisation and the Arts.

WILD ANIMALS, their Nature, Habits, and Instincts.

SKETCHES of the ANIMAL and VEGETABLE PRODUCTIONS of AMERICA.

By MARY ROBERTS.

With numerous Illustrations, bound and gilt, 3s. 6d. each.

Parker's Collections in Popular Literature.

CHRONICLES of the SEASONS; or the Progress of the Year; being a Course of Daily Instruction and Amusement, selected from the Popular Details of the Natural History, Science, Art, Antiquities, and Biography of our Father-Land. In Four Books; the First, containing the Months of January, February, and March; and the Second, April, May, and June. 3s. 6d. each.

POPULAR BIOGRAPHIES, with HISTORICAL INTRODUCTIONS and SEQUELS.

CUVIER and his WORKS; or the Rise and Progress of ZOOLOGY.

SMEATON and LIGHTHOUSES. 2s.

LINNÆUS and JUSSIEU; or the Rise and Progress of SYSTEMATIC BOTANY. 2s.

THE HISTORY of the INVASION of RUSSIA by NAPOLEON BONAPARTE. By EUGENE LABAUME, Captain of Engineers during the Expedition. 2s. 6d.

With numerous Illustrations, 2s. 6d. each,

THE USEFUL ARTS employed in the Construction of DWELLING-HOUSES.

THE USEFUL ARTS employed in the Production of CLOTHING.

THE USEFUL ARTS employed in the Production of FOOD.

Joseph Cooper, Esq.
Russell Jeffrey, Esq.
William R. Spicer, Esq.
Joseph Sterry, jun., Esq.
Robert Wilcoxon, Esq.

Bankers.—Messrs. Prescott, Grote, and Co.

ADVANTAGES.

A BONUS of two-thirds of the Profits allotted to the Assured.
LOWER RATES OF PREMIUM charged for Assurances without profits.
PREMIUMS payable Annually, Half-yearly, or Quarterly.
ASSURANCES OF EVERY DESCRIPTION may be effected. Among others, the important one, *originated by this Society*, of securing a sum to the Assured himself on his attaining any given age, or to his family *in the event of his earlier death.*
A POCKET DIARY containing detailed particulars, may be had on application at the Office, or of the Society's agents.

JENKIN JONES, Actuary and Secretary.

PROVIDENT LIFE OFFICE, 50 REGENT STREET, FEB. 15, 1844.
BONUSES DECLARED, 529,306*l.* 17*s.* 7*d.*

NOTICE is hereby given, that all Persons who hold Policies in this Office, bearing date prior to the year 1834, may receive the present value of the Bonuses which have been added to their Policies, upon application at the Head Office, or to the Agents through whom the Policies were issued.

GEORGE BEAUMONT, Actuary.

NEW PROSPECTUS.

ALBION LIFE INSURANCE COMPANY, Instituted in 1805, New Bridge-street, Blackfriars. Bonus every Three Years. Eighty per cent., or four-fifths of the profits returned on policies effected on and after this day.
The New Prospectus, containing a full detail of the highly advantageous terms on which Life Insurances are now granted by this Company, may be obtained at the Company's Office.
1st May, 1844. EDWIN CHARLTON, Sec.

VICTORIA LIFE ASSURANCE COMPANY.—*Trustees.*

Sir Jas. Duke, Ald., M.P., Chairman.
Benjamin Hawes, Esq., Deputy Chairman.
Benjamin Barnard, Esq. | Charles Baldwin, Esq.

Peculiar advantages are offered by this Company. Thus—
Parties assuring the lives of others may make their policies secure, notwithstanding the life assured may go out of the limits of Europe, without the necessary permission of the Directors having been previously obtained.
Credit of half the premiums for the first five years allowed on policies effected for the whole term of life.
On policies of five years' standing, half the amount paid, after the first year's premium, may be borrowed thereon by the Assured.
Advances made to assurers on real or undoubted personal security, for terms of years, re-payable by instalments.
Attention is particularly requested to the detailed prospectuses of the Company, which may be obtained at the Office, 18 King, William-street, City, or by letter, addressed to the Secretary.

WILLIAM RATRAY, Actuary and Secretary.

CORPORATION of the LONDON ASSURANCE:
Established A.D. 1720.

LIFE ASSURANCE.—Great advantages are offered to the public by this office:—
An annual abatement of premium after five years' payment.
A lower fixed rate without abatement.
Fire Insurance effected upon every description of property, including rent.
Assurances are also effected on ships and merchandise at sea, and going to sea.
JOHN LAURENCE, Sec.
Offices—19, Birchin-lane, and 10, Regent-street. Attendance daily from Ten till Four.

THE LANCET.—SURGERY.—A COURSE OF LECTURES on the OPERATIONS of SURGERY, by Mr. LISTON, of University College Hospital, illustrated by nearly ONE HUNDRED ENGRAVINGS, executed by BAGG, will be commenced in THE LANCET of Saturday 1st of June. The whole Course (consisting of 21 Lectures) will be revised by Mr. LISTON, for publication in THE LANCET.
A reprint still enables the Publisher to execute orders for complete Sets of the ENLARGED SERIES, amounting to NINE NUMBERS, containing all the INTRODUCTORY ADDRESSES yet published of Professor LIEBIG on CHEMISTRY.
Published every Saturday, price Sixpence; or, Stamped for Post, Sevenpence.
In Monthly Parts, Two Shillings each.
Sold by all Booksellers and Newsvenders.

BEE-HIVES.—GEORGE NEIGHBOUR & SON beg to inform their Apiarian friends that they have prepared for the season a large supply of "Nutt's Patent Bee-hives" (for the sale of which they are the only authorised agents), in which are embodied all the recent improvements. Their selection now comprehends most varieties in general use at the present time, including the "Single Box Hive," the "Ladies' Observatory Hive," the "Improved Cottage Hive," with glasses, &c., from either of which the produce may be taken at any time of the gathering season, without destroying the Bees.
G. N. & SON have also Glass Hives, and other articles connected with Bee management, a catalogue of which, with drawings, may be obtained. Letters of inquiry must have postage stamps inclosed.—Apiarian Depot and Honey Warehouse, 127, High Holborn, London.
NUTT ON BEES, Fifth Edition, now Published.

EXTRACT FROM OLD MOORE'S ALMANACK for MAY, 1844.—"CARE OF HEALTH.—The human frame often suffers greatly during this season, the hurtful influence of which is assisted by the premature adoption of the dress of summer. Those on whom the blight of consumption has fallen, frequently sink under it about this period, though the disease had commenced its ravages many weeks or months anterior to its fatal close. All unnecessary exposure on the part of such delicate persons to the morning and evening chills, should be carefully avoided. Also the full and plethoric will be benefited by the use of cooling medicines as PARR'S LIFE PILLS, and very temperate diet; as a tendency of blood to the head is not uncommon among such, giving rise to apoplexy and other fatal diseases of the brain. Young and stout persons even require some cooling purgative, as PARR'S LIFE PILLS which will lessen the heat of the skin, and perfectly cleanse the system."—PARR'S LIFE PILLS are sold by all respectable Medicine Vendors. See the words PARR'S LIFE PILLS, in White Letters on a Red Ground, on the Government Stamp.—Sold in boxes at 1*s.* 1½*d.*, 2*s.* 9*d.*, and family packets 11*s.* each.—T. ROBERTS and Co, 9, Crane-court, Fleet-street.

BERDOE'S SUPERIOR LIGHT WATERPROOF FROCKS for the present season.—An extensive variety of the above, in NEW and greatly improved materials (in lieu of the unsightly rubbish made by Slop-sellers), now ready; guaranteed to exclude any rain whatever, and confidently recommended to those who regard a respectable appearance, or wish to avoid disappointment and vexation. First-rate Clothing of every description upon the lowest terms possible, consistent with true economy and ultimate satisfaction.—W. BERDOE, Tailor, Waterproofer, &c., 69, Cornhill (North side).

PIANO-FORTES.—LUFF and Co.'s Boudoir or Piccolo only £25, including use of case, is the best and cheapest Piano-forte for the country Cottage, being only 3 feet 6 inches high, with curtain front and back: it is powerful in tone, is warranted to keep well in tune, and prepared for extreme climates. L. and Co.'s Patent Cottage Cabinet and Semi-Grand is equally cheap.—LUFF and Co., Manufacturers, 103, Great Russell-street, Bloomsbury.

News of the Week.

AFTER two nights' debate, Lord Ashley's motion for the introduction of a ten hours clause into the Factories Bill was negatived on Monday by an unexpected majority of 138, although the House had recognised the principle by two previous decisions in which the clause was affirmed, in opposition to Ministers, by majorities of 9 and 3. In the division on Monday, the effect of the announcement that the Cabinet, if defeated on this point, would retire from office, was distinctly visible; 74 members who had previously supported Lord Ashley were altogether absent from the House, and 14 other Members who had supported him in March now supported Ministers, in direct opposition to their former votes. On Tuesday, Mr. S. Crawford's motion for leave to bring in a Bill to extend the Parliamentary suffrage, was negatived by a majority of 66, and on the same day Mr. Watson's motion for a select committee to inquire into the propriety of continuing the compensation awarded to the six clerks in Chancery whose offices are abolished, was negatived by a majority of 16. On Thursday Sir C. Napier brought forward a motion on the state of the navy, with reference to the expediency of establishing a retired list for a fixed number of officers above 60 years of age, and of allowing them to sell their commissions. The motion was opposed by Government on the ground that its adoption would entail a great expense on the country for a mere experiment, and on a division it was negatived by a majority of 43.

In France the Secondary Instruction Bill, which is regarded by both parties as a trial of strength between the Church and the Universities, is still under discussion in the Chamber of Peers, and the Bill for regulating Prison Discipline is still before the Deputies. The long-expected measure for the gradual abolition of slavery in the French colonies has been introduced this week, and it is believed that all these measures will ultimately be carried in the forms proposed by Government.—In Spain, a decree has been published abolishing the state of siege which has so long oppressed the kingdom, and another decree dissolving the Cortes and convoking a new Assembly in November next is expected to appear shortly. The new Cabinet has secured the neutrality of the late Ministers by appointing them to lucrative situations, among which the late Premier has obtained the post of Ambassador to Portugal, one of the best paid of the Spanish Embassies.—From Portugal we have the details of the capitulation of Almeida, and the consequent cessation of the military revolt.—Accounts from Germany mention the occurrence of alarming riots at Munich, in consequence of a rise in the price of beer. The people destroyed several brewhouses, and the troops at first showed a disposition to support the movement, but ultimately they were induced to obey their officers and fire upon the people. Many persons were killed, and the consequences might have been still more serious if the King had not given way by ordering a reduction in the price of beer.—The news from Italy is still alarming: the people in all parts of the Peninsula are in a state bordering on insurrection, and the prevailing discontent is likely to be still further increased by the execution of six political prisoners, condemned by the Military Commission at Bologna. Fresh arrests have taken place in the Papal States and Naples, and alarm and uneasiness pervade all classes of society.—From the United States we have the important announcement that President Tyler and Mr. Calhoun, the new Secretary of State, have introduced in the Senate a Bill for the immediate annexation of Texas. This measure, which would doubtless lead to a rupture with Mexico, and probably with some of the European powers, is avowedly brought forward for electioneering purposes. It is, however, strongly opposed by Mr. Clay and Mr. Van Buren, who are also candidates for the Presidency, and it is generally believed that the Senate will reject it by a large majority.

Home News.

COURT.—The Queen held a Court at Buckingham Palace on Saturday, at which the Marquis de Viluma, the new Spanish minister, had an audience. On the previous day Prince Albert presided at a meeting of the Fine Arts Commission, and paid a visit to the London Library. On Sunday the Queen attended divine service in the private chapel of the Palace. On Monday Prince Albert visited the Artillery Ground, Finsbury, and on Tuesday the Queen and Prince, accompanied by the Prince of Wales and the Princess Royal, left Buckingham Palace for Claremont, and returned to town on Thursday.—It is stated that Norris Castle has been purchased by Her Majesty for 27,000*l.*, and that both Norris and Osborne

Castle will be immediately fitted up for the reception of the royal family.—Lady Caroline Cocks and the Hon. Miss Devereux have succeeded the Hon. Miss Stanley and the Hon. Miss Hamilton as the Maids of Honour in Waiting, and Colonel Arbuthnot has succeeded Colonel Buckley as Equerry in waiting to her Majesty.—The Queen Dowager will leave England for Germany on the 2d of June, on a visit to her relatives.

Parliamentary Movements.—Mr. Thesiger, the Solicitor-General, has been elected member for Abingdon, without opposition.—The representation of South Lancashire will be contested by Mr. Entwisle, on the Conservative interest, and by Mr. William Brown, a Liverpool merchant, as the League candidate.—Admiral Bowles has announced himself a candidate for Launceston, in the room of Sir. H. Hardinge, the new Governor-General of India.—A vacancy has occurred in the Kilmarnock district of Burghs, by the death of Mr. Johnston.—It is rumoured that Sir H. Fleetwood intends shortly to resign his seat for Preston.

Official Appointments.—Sir Thomas Fremantle, Bart. has been appointed Secretary at War in the room of Sir H. Hardinge.—The vacancy at the Board of Admiralty, occasioned by the appointment of Rear-Admiral Sir Geo. Seymour to the command in the Pacific has been filled by Rear-Admiral Bowles, late commanding on the coast of Ireland.—Rear Admiral Sir Hugh Pigott, has been appointed Admiral Bowles's successor in the command of the Irish squadron, and will hoist his flag in the Volage.—Captain R. B. Wood, of the 10th Hussars, now Private Secretary to Sir H. Hardinge, accompanies His Excellency in the same capacity to India. Capt. A. W. F. Somerset of the Grenadier Guards (son of Lieut.-Gen. Lord F. Somerset), Military Secretary to Lord Ellenborough, is to occupy the same post on the personal Staff of the new Governor-General.—The Queen has been pleased to direct letters patent to be passed under the Great Seal, appointing Capt. Robert Maunsell, C.B., one of the Commissioners of Greenwich Hospital, in the room of E. H. Locker, Esq., resigned.—J. C. Whiteman, Esq., has been elected an East India Director, in the room of the late Hon. Hugh Lindsay.

Foreign.

FRANCE.—The discussion of the Secondary Instruction Bill still occupies the Chamber of Peers, and is likely not to be closed before the end of this week, if even then. On Thursday the Chamber of Peers rejected the amendment of the Duc de Harcourt, the object of which was to exclude a clause from the bill which requires the heads of educational establishments and professors to declare that they do not belong to any unauthorised religious community. The mover's object undoubtedly was to enable the Jesuits to get a footing in the seminaries of education,—an object in which he was defeated. M. Guizot strongly opposed the amendment, and declared that the Jesuits had never changed either in their laws or their objects, and that the task of the present Government being to reconcile the principle of individual liberty, proclaimed by the memorable Assemblée Constituante, with the supremacy of the State, so vigorously established by Napoleon, there was, now-a-days, no room in France for the admission of intermediate bodies, such as lay or religious corporations, between the said liberties and supremacy. In Tuesday's sitting, the Minister of the Navy, agreeably to M. Guizot's late declarations of the Government's intentions, introduced a Bill for the improvement of the condition of the slaves, preparatory to the gradual abolition of slavery in the French colonies. "The object of the Bill," said Admiral de Mackau, "was to regulate the principal conditions of the intermediate state of things, which ought to precede a full emancipation, and to prepare the negroes for taking their place amongst the colonial population. 1. The conditions related to the food and comfort due by the masters to the slaves. 2. To punishments. 3. Duration of labour. 4. The marriage of slaves, and their religious and elementary instruction. 5. The savings of the slaves, and their right to purchase their freedom. New measures, the Bill stated, were to insure the repression of the cruelties sometimes committed against slaves, to modify the present legislation relative to Courts of Assize, and to increase the number of magistrates in the colonies. The Minister added that the application of the Bill would necessitate a credit of about 1,200,000fr." In the Chamber of Deputies the Prison Bill is still under discussion, and the principle of cellular imprisonment is fully adopted. On Saturday an amendment brought forward by M. Vatout, to postpone the application of the bill to the central and departmental prisons, was rejected; but on the previous day the Chamber adopted another clause of his amendment, providing that convicts sentenced to hard labour shall undergo solitary confinement by day and night.—The editor of the *Univers*, and the responsible agent of that Journal, who were charged with exciting to disobedience of the laws, in having published confidential letters addressed by several bishops to Abbé Combalot, on the occasion of his late condemnation, were both declared guilty by the jury on Saturday, and each sentenced to one month's imprisonment, and 3000f. fine.—The *Courrier Français* says:—"The report of the King's intended visit to England is revived. The Maritime Prefect of Cherbourg has sent an order to Havre for several silk flags, on which are to be emblazoned the arms of England and France. His Majesty, after his return from London, will make for Brest with the light squadron which is being fitted out to escort him. He will devote two or three days to the inspection of the port of Brest, where orders for his due reception have already been received." It is, however, believed that nothing is decided as to his Majesty's visit; and that if he comes at all, it will be no further than the Isle of Wight.—The Duchess of Kent left Fontainbleau on Thursday for Geneva, from which place she will proceed to Germany.—A circumstance has occurred in Paris, which is likely to create sensation in France and England. A pamphlet is to be published immediately, from the pen of the Prince de Joinville, entitled, "Notes on the State of the French Navy," in which his Royal Highness severely attacks the French Ministry and England. The King is greatly annoyed at the circumstance, and it is said that a scene of considerable violence occurred between the father and son, when the prince refused to suppress his labours. An extract from the publication appeared in the *Revue de Paris* on Tuesday, in which the author merely states that he has visited all the ports of France, and several of those of England, and that the navy, especially the steam navy of France, is greatly inferior to that of England, and below what it ought to be, considering the power and wealth of the country. The pamphlet was to appear on Wednesday, and was looked forward to with great interest.—The Lyons journals announce that the agents of the Legitimatists were exceedingly active in that city. Buttons bearing the effigy of "Henry V." (the Duc de Bordeaux) had been found on some of the late National Guard, and pieces of five francs, with the head of that prince and the words "Henry V., King of France," were in circulation in Lyons and its vicinity.

SPAIN.—We have accounts from Madrid of the 9th inst. The *Gazette* publishes the decree abolishing the state of siege throughout the kingdom. Messrs. Lopez and Madoz, against whom arrest warrants had been issued for alleged participation in the conspiracy of Alicant, and who had remained concealed ever since, had presented themselves to the Political Chief, by whom they were told that there existed no charge against them, and that they might consider themselves at liberty. A decree for the dissolution of the Cortes and the convocation of a new Assembly in November next, was expected shortly to appear. The journey of the young Queen to the baths of Caldas, in Catalonia, was again talked of. Some dispute has arisen as to the immediate cause which led to the downfall of the Bravo Administration. The friends of the late Ministry declare that S. Gonzales Bravo and his colleagues resigned because they would not agree to carry out a measure upon which the Queen-Mother had determined, namely, that of stopping the sales of the national property, and of restoring to the secular clergy all that portion of the property of the Church which yet remains unsold. Whatever be the cause of the rupture, the support, or at all events the neutrality, of the ex-Ministers is secured by appointing them to lucrative situations. S. Bravo is gazetted as ambassador to Portugal, one of the best-paid and most influential of the Spanish embassies; Gen. Mazarredo is appointed Captain-General of Madrid, which is vacated by General Narvaez, on his appointment as Prime Minister; and M. Carrasco is to be allowed to exercise his financial abilities in another quarter, being appointed Royal Commissioner of the new Bank of Isabella II., lately got up by himself in opposition to and in defiance of the chartered rights and privileges of the Bank of San Fernando. According to letters from Algesiras of the 1st inst. no symptoms of war were observable at Tangiers. The despatches brought by the frigate Christina had been presented to the Emperor of Morocco by the Spanish Envoys, who were received with marked attention by that Sovereign. In the meantime preparations were still making at Puerto de Santa Maria, but there is no doubt that the expedition will ultimately be given up. Accounts from the provinces state that smuggling is carried on to a great extent, and that a regular battle was fought on the 3d, at Almeria, between the Queen's troops and the smugglers, in which the latter were defeated.

PORTUGAL.—Intelligence from Lisbon, to the 6th inst., gives an account of the terms in the first instance proposed by the Count Bomfim, on the morning of the 28th ult., and refused by the General Fonte Nova, with the subsequent conditions accepted by the former, and the surrender of the town on the evening of the 28th. By those conditions, 41 military officers were permitted to retire into Spain, and 724 soldiers of different regiments laid down their arms, and were placed at the disposal of Government, and were already on their march to Oporto, guarded by one of the brigades of the Queen's troops. The intention of the Government, it was said, was to send them to Africa.

GERMANY.—Serious riots took place in Munich on the 2d and 3d inst. in consequence of a rise in the price of beer, and although the Court at the time was celebrating the marriage of the Princess Hildegarde with the Archduke Albert of Austria, the disturbances were not put down until the troops had fired on the people. After destroying several brewhouses, order was completely established, but more than 200 persons have been arrested. The Government states that the King, at the request of the brewers, ordered the reduction of the price of the beer, because the advance of price had created so serious a riot; but the real fact is, that the troops at first refused to fire upon the people, and the result might have been very serious, had the King not given way. Notwithstanding these events his Majesty left Munich on the 8th for Italy and Sicily.—The Austrian Government has nominated Baron de Hebert Governor of Mantua, in the place of Marshal Maggrecchelli, who retires. In the present state of Italy the Cabinet of Vienna was unwilling to have a commander of Italian origin in so important a command.—The ducal houses of Saxony and Anhalt have, of their own accord, assumed the title of Highness. The example has been set by Saxe-Coburg in England and Portugal. The Confederation will have to pronounce on the subject.—A violent schism has arisen amongst the Israelites at Frankfort. Two-thirds of the community have separated from the synagogue, and formed a separate sect, styling themselves Reformers. They neither recognise religious ceremonies nor the fundamental laws of the Talmud. In their declaration of principles they declare that they will no longer circumcise their children, and totally renounce the belief in a Messiah. Baron Anselm Rothschild, the head of the celebrated banking-house at Frankfort, has declared a determined war against the new sect, and refuses to discount any bills bearing the signature of any of the new community. The affair has been laid before the Germanic Diet. The sectarians are accused of fomenting and concealing in their religious formula political tendencies subversive and pernicious for the state. Notwithstanding these accusations, the Senate of Frankfort has declared warmly in favour of the new Israelites.

ITALY.—The military commission which sat at Bologna some time ago, on the 11th of March condemned twenty persons engaged in the political disturbances to death, thirteen to the galleys for life, three to the galleys for twenty years, and two for five years, and the whole of them to confiscation of their property. Of those condemned to death, fourteen had their sentences commuted to condemnation to the galleys for life. The six others were shot on the 6th. This execution has made a great sensation at Bologna. On the 2d several other persons were arrested in the same city, among whom were M. Galleti, L.L.D., one of the most distinguished lawyers of Italy, and his clerks, MM. Orsina, father and son, who are furnishers of military stores to the Government, a student of medicine, and two or three others. These arrests make the greater impression, as it was expected that after the numerous condemnations by the military commission, the Government would have relaxed in its rigour. From Naples we learn that insurgent armed bands, consisting of 2000 men, traverse Calabria from one end to the other, that they had already had several encounters with the troops, and that the insurrection had extended to the province of Apulia. New arrests of suspected persons had taken place at Naples, and the Government was much alarmed by not merely the political ferment which prevailed, but by the depth of misery in which the population were plunged. A letter from Reggio, dated April 29, states, however, that the 7000 troops sent to Calabria at the commencement of the troubles at Cozenza had been recalled—a circumstance which would indicate that no alarm existed respecting the situation of that province.—The disputes between Sardinia and Tunis are settled.

HOLLAND.—A sudden fire, the origin of which is not yet known, broke out on the 8th inst., between five and six o'clock, in the Royal dockyard at Amsterdam. It was first discovered in the carpenters' shops; the whole of the building containing them was entirely destroyed, and also part of the forge. The fire spread so rapidly that the whole of the buildings would have been destroyed, but by great exertions the fire was got under without extending beyond the buildings first mentioned.

SWEDEN.—A letter from Stockholm states that a report was current that, from motives of economy, the King will not be crowned either in Sweden or Norway. Three other Kings in Europe, those of France, Prussia, and Belgium, not having undergone this ceremony, the King of Sweden feels that he can dispense with it.

SWITZERLAND.—The last accounts from Switzerland state that the Government of Valais, finding it impossible to terminate the dissensions which disturb that canton, had applied to the Vorort for its intervention. The Duchess of Kent arrived at Geneva on Sunday, and took up her residence at the Hôtel de l'Ecu de Genere.

UNITED STATES.—We have arrivals from New York with accounts to the 30th ult. President Tyler and Mr. Calhoun, the new Secretary of State, no doubt with views to the next presidential election, have laid before the Senate the extraordinary step of a treaty for the annexation of the territory of Texas to the United States. The leading terms of the treaty are as follow:—The United States are to discharge or assume the debts of Texas, to the amount of what the sale of Texian lands will pay, and no farther; the assumption only to equal the sale of lands. Texas to be admitted as a territory, and to be allowed one Delegate in Congress. Nothing is said about slavery. The introduction of this measure has produced the utmost excitement among all classes, and both Mr. Clay and Mr. Van Buren have published their opinions on the subject. Mr. Clay's letter sets forth how completely, by their own voluntary act, the United States have given up all right and title to the territory of Texas. "It is, therefore, as ridiculous, he says, to talk of our resuming our title to it, as for Great Britain to resume hers to the United States. We have fairly alienated our title, by solemn national compact. Mexico, he adds, has preserved all her rights. She still claims Texas, and our assumption of this territory would be a virtual declaration of war against Mexico—a war wholly unjust and inexpedient. But, even should Mexico assent, he argues it would not remove obstacles with other foreign powers: and the measure ought never to be admitted against the wishes of a very considerable portion of the Union." Mr. Van Buren may be considered as also opposed to annexation, though perfectly willing to abide and bend to the decision of the people of the different states, whose wishes he

thinks should be considered upon such an important subject. He thinks the annexation constitutional, but, under the present circumstances, unjust towards Mexico, unfair in principle, and tending directly to a war with Mexico. He does not believe that Texas could be induced to cede her territory to a European power, or that England has any idea of such an acquisition. A large meeting had been held in the Tabernacle, New York, of those who disapproved of the step, and resolutions strongly declaring that opinion were passed amid some opposition from a party who came there to interrupt the meeting. In consequence of these proceedings, the Mexican Minister has suspended his functions with the Executive; and a correspondence has taken place between the Secretary of State and our Minister, Mr. Pakenham, respecting the alleged interference by England with slavery in Texas. Any purpose of such interference has been explicitly disclaimed on behalf of his Government by Lord Aberdeen; but Mr. Calhoun, in his reply, undertakes to prove inferentially that this disclaimer cannot be true, and expresses his opinion in terms which even the New York papers condemn as discourteous, and unworthy of diplomacy. It is, however, believed that the motives for which the treaty has been started are so self-interested, that the Senate will at once reject it, and thus avoid all danger of future hostilities. The course which Mr. Calhoun has taken relative to the Oregon Boundary has arrested the negotiation upon that question with Mr. Pakenham, and it is said that it cannot be resumed again until Mr. Pakenham shall have obtained further instructions from his Government.—The Quebec papers state that a disease resembling the leprosy of the 17th century has made its appearance among the French Canadians, and that the Chamber of Representatives were about to take it into consideration.

Parliament.

HOUSE OF LORDS.

Friday.—After the Duke of Richmond's motion for returns respecting the Wool Trade had been agreed to, Lord CLONCURRY moved for the appointment of a select committee to inquire into the public works which ought to be undertaken in Ireland, and how the territorial condition of that country could be improved by means of railroads and a proper system of drainage. There were, he said, three millions of acres in Ireland wholly unproductive for want of proper drainage, and the fisheries were greatly neglected.—The Duke of WELLINGTON said that the object of the motion and inquiry being to obtain money, to an amount of between five and ten millions, he was not prepared to give his sanction to any proposition that would raise the expectation of any such grant towards public works and improvements of the soil in Ireland. He begged their lordships to wait until the report of the commission under Lord Devon's superintendence made its appearance, and which report would include a portion, at least, of the matter under consideration.—The Marquess of CLANRICARDE expressed his surprise at learning that Lord Devon's commission had anything to do with the promotion of public works in Ireland. He said the time had come when it was absolutely necessary that the Imperial Legislature should do something for Ireland.—The Earl of DEVON thought that his commission was better calculated to investigate the questions of public works and drainage than a committee of the House. He considered that such was the state of the poor of Ireland, that assistance on the part of the Imperial Legislature must, in some way or other, be given. The commissioners would not hesitate to consider seriously, and report their opinion as to the best mode in which that assistance should be given.—Lord CLONCURRY withdrew his motion at the suggestion of Lord NORMANBY.

Monday.—Lord BROUGHAM moved the second reading of his Bill for consolidating and digesting the statute and common criminal law of the country, and for reducing it to one compendious code, founded on the report of the criminal law commissioners. His lordship at great length described the enormous and scattered mass of laws, of rules, of dicta, of decisions, of comments, and of reports which at present form the fountains, currents, and streams of criminal jurisprudence—filling 150,000 close-printed folio pages: he ridiculed the possibility of even lawyers knowing or comprehending the discordant and heterogeneous pile, much less the unlearned subject who was bound to obey them; he pointed out the absurdity and cruelty of many laws, though obsolete, yet unrepealed, and instanced some which defied their ingenuity to discover whether they were repealed or not. Having quoted many great authorities, ancient and modern, in favour of the general plan of a digested code of criminal law, Lord Brougham moved the second reading of his Bill.—The LORD CHANCELLOR concurred in the Bill, so far as the statute law was concerned, and proposed to give it a second reading, and then to leave it to stand over to next Session, until the commissioners should make their report on the subject of the procedure and trial of criminal cases.—Lord DENMAN thought that, pending the consideration of this Bill, a large portion of the offensive and unjust criminal statutes should be at once repealed.—Lord BROUGHAM acceded to the suggestion, and the Bill was read a second time.

Tuesday.—The Factories Bill was read a first time. The Marquis of NORMANBY brought forward the case of Mr. Gray, who has been dismissed from the office of stipendiary magistrate in Ireland for having obtained, in an improper manner, a seditious ballad, and for having concealed that fact from the Government. The noble marquis complained of the revival in Ireland of the spy system, and entered into various cases to establish his charge. He moved for the correspondence that had taken place in reference to the dismissal of Mr. Gray.—Lord WHARNCLIFFE said this gentleman had been dismissed on the report of Mr. Brewster, and maintained that when Lord De Grey found so much indiscretion on the part of a stipendiary magistrate of police as to forfeit the confidence of the Government, he was perfectly authorised and justified in dismissing him. After some further discussion the motion was carried.—The Earl of MINTO moved for a return of the number of days her Majesty's ship Queen had been at sea, and the accounts which had been received at the Admiralty respecting the sailing qualities of that ship, and the experiments which had been made with her. He said the Queen was a three deck ship, and belonged to a new and improved class, and if, on trial, she was found to answer, other ships were intended to be built after her model. It was, therefore, important that the qualities of this ship should be properly tested, in order that it might be seen whether she possessed either merits or defects. He was told that this ship and the Mediterranean squadron were not as usefully employed as they might be, and that instead of being at sea, for the purpose of enabling young officers to learn their duties, they were in Malta harbour.—The Earl of HADDINGTON objected to the motion. It was a mistake to suppose that this ship had been only got out on a holiday cruise, because she had been tried against the Formidable on her way out, and afterwards against one or two of the other line-of-battle ships in the Mediterranean. The last trial was with the Vernon, and then the two vessels were separated by a violent tempest, so that no result was known. The motion was negatived without a division.

Friday.—Lord ABINGER took the oaths and signed the Parliamentary Roll.—Lord BROUGHAM asked the noble Secretary for Foreign Affairs if he had received information with respect to the annexation of Texas with the United States. This was a question of vast importance, so far as the abolition of slavery was concerned, but he trusted that the deciding portion of the Congress, namely, two-thirds of the members, would oppose it. Nothing which had dropped from the noble Lord at the head of the Foreign Department even justified the inference that this country, although deploring the existence of slavery, ever contemplated any interference with the Constitution of America.—The Earl of ABERDEEN said the noble and learned Lord could not expect him to give a precise answer to the question he asked. It was a subject quite new, and unexampled in the history of Nations, and his noble and learned Friend might depend upon it that it would receive the most serious attention of her Majesty's Government. It was true he believed that the treaty for the annexation of Texas to the United States had been signed, but he agreed in the hope expressed by his noble and learned Friend that the majority of Congress would not agree to the ratification of it. At present he could not speak with confidence on the subject, but when the time came, he should state his opinion to the House, and act consistently with his duty as a Minister of the Crown. Nothing that he or the Noble Lord opposite had ever said, could justify the suspicion that they intended to interfere with American institutions.—The Marquis of CLANRICARDE presented a petition against the Irish Poor Law, and said it was perfectly impossible, if they wanted to maintain peace in Ireland, that this law could be continued. In the newspapers of this day were detailed the circumstances of an affray caused by the collection of poor-rates, when the highest amount due was only 1*s.* This measure had been carried completely against the will of the greater number of the Irish Members, and therefore must have been ill-suited to the condition of the country.—The Duke of WELLINGTON agreed that this was a subject of great importance. The report of the Commission appointed to inquire into the subject would be laid upon the table in a very short time, when their Lordships would have better information.

HOUSE OF COMMONS.

Friday.—After Lord ASHLEY had proposed the additional clause in the Factory Bill, limiting the labours of young persons to ten hours a day, and which was given in our last Number, Sir J. GRAHAM said that looking to the purity of Lord Ashley's motives, he did not think that a better man could engage in this agitation, which placed the House in the startling position of deliberately entertaining a question which a Minister of the Crown, conscientiously applying his judgment to the subject, believed to be dangerous to the interests of the state. The Government were taunted with departing from principle; it was true; in their anxiety to provide a remedy, they had trenched on principle, and had gone as far as they dared. Lord Ashley talked lightly of a "little reduction," as if that could be "little" which would reduce the labour of every operative twelve hours in every week, and strike off six weeks in every year from the productive industry of the country. He was glad, however, that the noble Lord, instead of resting exclusively on moral grounds, as at first, had now descended to those commercial considerations which were the most fitting for the treatment of the question. Cheapness was the prime element in successful production; the price in the foreign market must rule the home; and the necessary consequent increase both in foreign and home manufacturing productive power (statistics of which he adduced), led inevitably to cheaper production and increased competition. He did not view with unnecessary alarm foreign competition; but he read a passage from a recent report of Mr. Horner's, in order to show the activity of our foreign rivals. Refusing to enter on the Corn-law question, as connected with the present one, he intimated that the *onus* lay on Lord Ashley to prove that the present arrangement of the hours of labour in this country was morally wrong, and could not, therefore, be politically right. The reduction of wages involved in the diminution of the hours of labour would be confiscation without compensation—a subtraction of the only capital possessed by the labourer to the extent of one-sixth—which might involve in it wide-spread barbarism and the degradation of society; and those who advocated the ten hours were responsible before God and man for the consequences of a measure the true nature of which had not yet been fairly placed before the working classes. Even Mr. Kenworthy, the great authority of Lord Ashley, had admitted that the reduction to the ten hours would involve a loss of very nearly ten per cent. on the capital employed; and this, confirmed as it was by accurate calculation, showed the danger to which we might be exposed from foreign competition; Lord J. Russell, who was now friendly to the limitation, had, in 1839, denounced it as inhuman and cruel; and in 1842, alluding to what he termed the "theatrical" interviews of the ten hour agitators with members of the Government, had complimented Sir R. Peel for his wisdom and caution in resisting a proposition would cut to the roots our commercial prosperity. The Noble Lord had changed, but he (Sir J. Graham) had remained firm to his conviction of the impolicy and danger of the ten hours, and he never gave a vote with more satisfaction than in resisting it.—Lord HOWICK considered it a dangerous straining of the deliberative powers of the House, for the Government to stake their ministerial existence against a proposition of this kind. Sir R. Peel had opposed the repeal of the Test and Corporation Acts; yet when decided against him by the House, instead of resigning, he was a member of the Government which carried it. He admitted that the adoption of the ten hours would compel us to give a larger amount of our own industry for the products of other countries; but this would fall, not on the workmen or the manufacturers, but on the community at large. But the ruin of our manufactures, from foreign competition, was a visionary fear; the reduction of our productive industry should be met by that freedom of exchange which would enable us to trade with other countries on natural principles, while the rapid improvement in our machinery would enable us to maintain our rivalry with foreign manufacturers. Were they to persist in maintaining a system which overtaxed the powers of women and children, when they could compensate any reduction in our productive industry or in wages by lowering our import duties? It could not be denied that the working classes were all in favour of the ten hours, and he warned the house against being led by Ministerial influence to thwart their expectations, by rescinding former votes, and refusing to listen to even the most reasonable compromise.—Mr. LIDDELL thought that many Members had voted with Lord Ashley without due reflection, and had been unwarily committed to a vote, as he had been, on the ten hours; but as he could not believe that the Government could have any other motive than care for the public interest in resisting the limitation to ten hours, he would now give them his support.—Mr. BERNAL retorted the allegation that the advocates of the ten hours were pandering to the passions of the people. The operatives at Manchester, Bradford, and Halifax had openly responded to the question whether or not they were willing to submit to a reduction of wages; and at this time of day, were they to be told that the intelligent workmen of this country could not form sound opinions on what concerned their own interest? The House was not the proper arena for the discussion of mere questions of political economy; nor could we deal with masses of men as with chess-men. If foreign competition were really so frightful, why not go backwards to the old state of the law, and permit our factories to be worked any amount of hours whatever? All the evidence proved the injurious consequences of 12 hours' labour on the moral and physical well-being of the operatives, especially the females and young persons; and he hoped Lord Ashley would never abandon the question until it was carried.—Mr. G. KNIGHT had studied the subject with great anxiety for the welfare of the working classes, and having had time to get sober on the subject, he had come to the conclusion that the adoption of Lord Ashley's proposition would be injurious to their true interests.—Mr. C. BULLER thought that Mr. G. Knight was a remarkable instance of the facility with which men forgot recent events; for, in his present sobriety, he had forgotten his three votes in favour of the ten hours. The tone of the opponents of Lord Ashley's proposition was now exceedingly low; very little was said about principle, and the question was now only one of degree. The House had, in recent times, repeatedly interfered with adult labour, as in Lord Ashley's Mines and Collieries Bill, the prohibition of the exportation of Hill Coolies, and so forth. There was therefore no question as to principle; and there remained therefore but the degree of caution and expediency which should regulate their interference. Who could doubt that the factory operatives worked too long? or that a remedy was required for a social state of things which precluded the use of all opportunities of recreation or improvement? The present proposition of Lord Ashley was for an experimental trial of eleven hours; and if that worked badly, how easy would it be to retrace their steps! The working classes, who desired the present change, and who must bear its weight, would be the loudest and the earnest in asking them to remove the restriction. They were frightened by those who upheld the Corn-Laws with the fear of foreign competition; and even advocates of universal suffrage implied that the working classes, on a question affecting their own interests, were incapable of judging for themselves. Danger was alleged from interference; but was there no danger in leaving the working classes to believe that Parliament would do nothing for them, and that it left them without protection and to their own resources?—Mr. ROEBUCK replied that it was still more dangerous to lead the working classes to believe that Parliament could do everything for them, and, above all, that it could settle and regulate their rate of wages. Lord Howick characterised this interference as "bold legislation;" it deserved another name, for it was rash and meddling—"fools rushed in"—he would not go on with the quotation. It had been proved that the manufacturing population were better paid and better lodged than the rest of the labouring community; and from that position they were not to be driven by all the humanity mongers in the world. Mr C. Buller twitted Mr. Gally Knight with inconsistency—"those who live in glass-houses should not throw stones." He did not wish to take the opinions of the working classes at second hand; he would rather that they had the opportunity of stating their own case by their own representatives. Lord Howick, in this question, had derived his knowledge from the New Moral World—he was but a humble plagiary of Mr. Owen. If there would be no rise in prices, were they prepared to encounter a fall in profit, on the bidding of men whose contempt for political economy was but the cover for their ignorance of it? The working classes did not contemplate a reduction in wages, which, when it occurred, would destroy all chance of being able to improve their moral condition. The nostrum of the ten hours was nothing but a mischievous quackery. What would they say to him, if he came down with a detail of the actual miseries endured by the people of Ireland, and made a proposition to deprive the landlords of their property, in order to alleviate their condition? That he was a madman or a knave. Lord Ashley had grossly exaggerated the evils of factory employment; the adoption of his proposition would establish a *minimum* of wages; and in the deteriorated condition of a discontented people, they would learn too late how fatal was the interference which they had been induced to make on insufficient evidence.—Mr. FERRAND had been informed by the working classes, that they had a very indifferent opinion of Mr. Roebuck, and looked upon him as one of their bitterest enemies. As the representative of hundreds of thousands of his humbler fellow-countrymen, he denounced the evils which they endured, and demanded a remedy for them, especially the contraction of their hours of labour. They were loyal and peaceable; but if they wished them to remain so, they must do them justice.—Mr. MUNTZ said, that a strike for wages would have all the ill effects of a Ten Hours Bill, and the working classes were determined to strike in order to obtain it. No doubt it was an interference with principle, but was there any "principle" connected with their legislation at all? It was all a mere legislative expediency. The Corn-law, Truck-law, Emigration-law, and the Poor-law, were all based on bad principles, or worse, cold, calculating philosophy. He would like to see the experiment of the ten hours tried, and was willing to take his share of the responsibility; the fears as to our foreign trade were absurd, for it was worth very little.—Mr. M. PHILIPS, connected as he had been with our commerce all his life, was surprised to hear such a statement uttered, though it was in keeping with other extravagant statements uttered in the House. They must not legislate on "chances:" if they lost their foreign trade for six months they would find out their mistake too late. Sincerely desirous of the welfare of the working classes, he would avert from them so great a calamity. He mentioned some matters as coming within his own knowledge, to show that some of the ten-hour agitators were not sincere, and that the evils of the factory districts were exaggerated.—Great clamour now prevailed, one set of Members calling for an adjournment of the debate, others insisting on a division. At last the adjournment was agreed to.

Monday.—Mr. THESIGER took his seat for Abingdon, and Mr. Scott MURRAY took the oath as a Roman Catholic.—On the motion of Sir T. FREMANTLE, a new writ was ordered for Launceston, in the room of Sir H. Hardinge.—In reply to Colonel Wood, Sir J. GRAHAM stated that a Bill was in course of preparation, founded on the report of the commissioners who sat last year in Wales. It was already in an advanced stage, and he hoped to introduce it next week. He also hoped that the Bill would be ultimately susceptible of adaptation to the entire principality, but it was in the first instance to be confined to the seven counties mentioned in the report.—The adjourned debate on the Factories Bill was resumed by Mr. M. MILNES, who argued that the long-hour factory system was the white slavery of this country, and that if it cost us as much to get rid of this opprobrium, as it did to emancipate the black population of our colonies, we should be prepared to meet it. He looked upon this question, and the confusion of parties which it had produced, as the harbinger of better things for the working classes, and the result of which would lead them to repose confidence in the large body of men who, in that House, desired their welfare.—Mr. WARD replied to the imputations and taunts about "theorists," "political economists," "long chimneys," and so forth, with which the advocates of the ten hours interlarded their speeches. Even such a man as Mr. Muntz talked lightly of the value of our foreign trade; and Mr. Gally Knight, who belonged to a class, the value of whose landed property "long chimneys" had doubled, and who had given three votes on the ten hours before he began to reflect on the subject, had at last been taught reflection by the very political economy he affected to despise. It was easy to get up a case, supported by an apparent show of statistical authority; but as the factory labourer had been shown to be better rather than worse off than other portions of the working community, they had no pretence for interference. They had been told by Mr. C. Buller that it would be easy to retrace their steps if necessary. But all experience showed that a commercial market once lost was never regained.—Mr. M'GEACHY said that he had generally supported her Majesty's Government, and would do so as long as they were the exponents of the principles which they professed, but in this case it did not appear to him that they were so. He had gone down to

the manufacturing districts during the recess and had inquired of the people themselves; and they had told him that they would prefer ten hours with less wages, for they believed that great advantages would result to them from the alteration.—Mr. M. SUTTON spoke against, and Mr. HAWES in favour of the ten hours restriction.—Lord POLLINGTON saw no reason to change either his opinion or his vote in favour of Lord Ashley's proposition.—Mr. LABOUCHERE also opposed it.—Mr. S. WORTLEY had arrived at his conviction from deliberate and careful inquiry, founded on the best information that he could procure; and without hesitation, or without apprehension of the result, he should vote in favour of the clause.—Mr. BRIGHT went minutely into detail, in order to show that Lord Ashley had been led into gross exaggeration with respect to the nature and extent of the toil of the spinners. Some of the chief informants of Lord Ashley were men worthless in character, and had been convicted of breaches of the law, especially one Mark Crabtree, who was a "short time" delegate, and a haunter of the lobby of the House, and who had been in an awkward position at Aylesbury about a silver spoon and other articles. He counselled Lord Ashley to get rid of such advisers and guides; and warned the House that the direct road to diminution of toil was by first enlarging the field of subsistence through the operation of free-trade.—Lord ASHLEY briefly explained that, with reference to a particular statement which he had made, Mr. Bright had fallen into error, and then indignantly asked who was the gross exaggerator?—MR. SHAW, seeing that the question between 12 and 10 hours was one, not of principle, but of degree, and not being affected by the ingenious calculations which had been adduced by Sir R. Peel and Sir J. Graham, felt bound to maintain his own consistency, even in the face of the alleged hazard of breaking up the Government.—Mr. C. WOOD argued that the striking off of one-sixth from our productive industry by the adoption of the ten hours would fall inevitably on consumption through wages, aggravate that moral condition which they wished to amend, affect capital as well as labour, by diminishing profit; and, amongst other sufferers, reach the hand-loom weavers, whose state had already been so long and so deplorably low.—Mr. B. COCHRANE supported the ten hours, and thought that the existence of the Government was not necessarily dependent on their defeat on this question.—Sir R. PEEL remarked that if the Government were wrong in proposing a limitation to twelve hours, that was no justification for those who pushed it farther. Taking the number of persons employed in the factories at 450,000 (estimated by the horse-power of the machinery), and their wages at an average of 10 shillings each, that would give a weekly sum of 225,000*l.* paid in wages; and from this, the adoption of the ten hours would strike off 36,000*l.* per week. That was an enormous experiment; and they must bear in mind that, in diminishing the labour of a factory operative, they were not dealing with individuals working with such a simple power as a spade, but were controlling a wonderful machine, capable of producing enormous quantities. The proposition would be, in fact, a tax upon the income of the working man to the extent of 16¼ per cent.; and not only so, but they would lay such a tax on machinery as the handloom weavers, in their short-sighted desire to maintain their unequal and hopeless competition with the power-loom, had asked to be laid on, in order to discourage factory labour. It was alleged that increased activity and energy would produce as much out of ten as at present out of twelve hours. He had been furnished with a calculation from a mill, which, in 1842, had been compelled, by accidental circumstances, to work for five weeks, on ten instead of twelve hours. The result showed that the actual produce fell below what, calculating from time, should have been the diminished product. This was decisive on the point. They were told that what was "morally wrong could not be politically right." What was the meaning of this? Who was to set up the standard in politics of that which constituted "moral wrong?" A despot might make that "politically right," which others considered "morally wrong." If twelve hours were wrong, and ten hours right, how would they meet the man who contended for eight hours? He could not reconcile the notions of Lord Howick about our foreign trade with the commonly-received doctrines of political economy. Exports were surely as important as imports; and the cheaper we produced, the more able were we to command by our manufactures the produce of other countries. He was afraid of foreign competition. A long period of peace had ensued; and, reading from a recent report by a Belgian gentleman, who showed that in the United States, France, Prussia, Austria, &c., the hours of labour varied from 74 to 84 up to 94 hours a week, while in England they were only 69, he warned the House against attempting their farther reduction to 58. We were reviving in our commercial prosperity, but that very revival only showed the intensity of foreign competition, and the danger of interfering with our own more modified hours of labour. Strange doctrines were uttered in the course of the debate; Mr. Muntz, Member for Birmingham, intimated that it would matter little whether or not we retained our foreign trade! and so experienced a man as Mr. Bernal repudiated the principles of political economy in dealing with this question—that is, he repudiated principles of wisdom matured by experience. Depend upon it, other demands would press upon them if they yielded to what was supposed to be the popular will. The turn-out colliers had issued an address, in which they claimed, with much show of reason, 4*s.* for eight hours' work; and such would be the nature of the requests which would be pressed upon them. He called on them to aid the Government in resisting the popular will, because it would not be for the popular interest; but if they did not, they must pursue their triumph under other auspices, and with guides who could see more clearly than they did their way in this matter. For himself he was prepared to retire into a private station, rather than retain office for the purpose of carrying what he conceived would be so injurious to the welfare of the community.—Lord JOHN RUSSELL did not think it fit to mix up this great question with that of Ministerial confidence. Were they to reject all useful reforms, lest it would affect the existence of the Ministry of the day? By their twelve hours they refused to adopt the 84 or the 94 hours per week of other countries; and as Adam Smith had not pointed out in what lay the difference between twelve hours and ten, they were not to be taunted with flying in the face of the principles of political economy. The proposition of the ten hours was founded on considerations of what was due to national health and morality, which were just as important as those relating to national wealth. He was not disposed to undervalue foreign competition; but the conflicting calculations of Mr. Senior, Colonel Torrens, and Mr. Kenworthy, did not, on examination, bear out the allegation that the restriction of our hours of labour would so raise the cost of our manufactures as to render them unsaleable in foreign markets. But even supposing our foreign competition to be more formidable than it was in reality, there was the tax on raw cotton, which amounted to 8 per cent., while the proposition of Lord Ashley would only affect production to the extent of 7 per cent. And there were the taxes on food. Would they continue to over-tax the powers and the labour of young persons, in order to maintain the Corn-laws? He had changed his opinions on this question; but the question was, had he been actuated by an unworthy motive? Only one member had so insinuated—Mr. Roebuck—who, however, had taken himself out of the sphere of our sublunary transactions, for, in quoting "fools rush in"—he insinuated that he was himself the angel. Nor was the taunt of change very forcible, as coming from the Ministerial benches. Sir R. Peel, who had so recently laid down such clear principles on the currency, had, in early life, voted with his leaders against the doctrines he now advocated. The real question on the subject of the ten hours was what was beneficial for the population; and looking to their congregation in masses, he warned the House that if they neglected them, they might one day awake from their pleasant dream, and find them menaced by multitudes disregarding all that they were accustomed to esteem as sacred. Looking to the moral condition, and desirous of affording them time for education and social improvement, he would cheerfully vote for Lord Ashley's motion.—Sir R. INGLIS and Mr. COLLETT added a few observations, amidst much uproar, the latter expressing his wish to see the amendment carried, for the purpose of getting rid of the Bill altogether.—A division then took place, when there appeared;—for Lord Ashley's motion, 159; against it, 297; majority against the ten-hours clause, 138.—This announcement was received with much cheering and triumphant laughter on the Ministerial benches.

Tuesday.—On the motion of Lord M. HILL, a new writ was ordered to issue for Kilmarnock, in the room of Mr. A. Johnstone deceased.—Mr. COLLETT asked Sir R. Peel when he intended to proceed with the Irish Registration Bill?—Sir R. PEEL answered, certainly not before the holidays.—Mr. S. CRAWFORD asked for leave to bring in a Bill to extend the Parliamentary suffrage, and to secure the free representation of the people. He was supported by Dr. BOWRING, and a division being called for before any reply was made to these two speeches, his motion was rejected by 97 to 31.—Mr. WATSON brought under the consideration of the House the nature of the recent act, 5 & 6 Vic., c. 103, awarding compensation to the six clerks in Chancery, whose offices were abolished. These compensations had been valued by a competent authority, and it was calculated that they would cause a charge upon the suitors in the Court of Chancery of one million of money. The annual sum to be paid was 78,741*l.* 14*s.* 11*d.* out of the pockets of the suitors. The offices of the six clerks were ancient offices, but latterly the duties had been very small indeed. They were not appointed to any office, they had merely a monopoly of a business—to conduct the business of the Court of Chancery. In the reign of Charles II. there were 90 of these persons. They had little or no duty to perform; in fact they were an absolute obstruction to the public business; they had little more to do than to attend at their offices in Chancery-lane, and some of those individuals were now receiving upwards of 7000*l.* a year. They were declared to be entitled to a compensation of 5500*l.* a year for life; and he did hope the House would think that it was a case which called for the most rigid inquiry. Their fees depended on the number of attorneys employing them. A man might fill the office for 50 years and not receive one shilling, but if he was enabled to conciliate the attorneys he might make a large income. The Lord Chancellor and the Master of the Rolls had the power of altering the fees which they were allowed to receive, from day to day and from hour to hour. Lord Hardwicke in his time published an order as to these fees, and some alteration was also made in them by Lord Erskine. There was, in fact, no permanence in fees. The offices were a positive abuse at that time; and it was for such offices, known to have been an abuse, that compensation was given. All the Admirals in the Navy did not get as much; neither the naval or military service was rewarded in this way. What officers in the civil department received salaries so enormous? The Masters in Chancery, who had only to tax six-and-eightpences for five or six hours in the day, received a salary almost equal to the Speaker of the House of Commons. The thing was almost too ridiculous to be treated seriously. He moved for a select committee to inquire into all the circumstances attending the passing of the compensation act, and into the nature, duties, and emoluments of the officers, and the propriety of continuing their compensation.—The Solicitor-General, Mr. THESIGER, defended the act, mainly on the ground of vested interest; and after a debate, in which Mr. JERVIS, Sir J. GRAHAM, Mr. WILLIAMS, Mr. C. BULLER, and Mr. WARBURTON, took part, the motion was rejected, on a division, by 84 to 68.—Sir D. NORREYS brought forward the names of several Members to form the select committee on the Irish Poor Relief Bill.—Sir J. GRAHAM now opposed the appointment of any committee, and on a division the question was decided against the committee by 42 to 10.—On the motion of the CHANCELLOR of the EXCHEQUER, a select committee to inquire into the duties and emoluments of the Clerk of the Crown in Chancery was granted.—Sir D. NORREYS obtained a select committee to inquire whether the present townland valuation of Ireland, made by the commissioner of valuation under the Act 1 & 2 Vic., c. 52, can be made available for the imposition of poor rate and other local rates in that country; and also, whether it be not desirable to alter the principle on which the townland valuation is now constructed.

Wednesday.—The House sat for about half an-hour; and after a few petitions had been presented, Mr. GLADSTONE brought up the report on the select committee on railways, which was ordered to be printed, when the House was counted out.

Thursday.—The CHANCELLOR of the EXCHEQUER announced that he could not go into committee on the Sugar Duties until Monday, the 3d June.—Sir R. PEEL gave notice that he intended to move, on this day week, that the House at its rising adjourn till the Thursday following, being the Whitsun recess.—On the motion of Mr. T. DUNCOMBE, a return was ordered of all moneys paid, or to be paid, to Mr. Hughes, or any short-hand writer or writers, for notes taken of the proceedings in the Court of Queen's Bench, Dublin, previous to and during or since the trial of "the Queen *v.* O'Connell and others." Also, a return of all moneys paid, or to be paid, for any notes taken of the proceedings at Conciliation Hall, between the 1st August, 1843, and the present time.—Sir C. NAPIER brought forward the state of the Navy, and moved a resolution to the effect, "That it is the recommendation of this House, that previously to the preparation of the estimates for 1845, a plan of retirement be devised for the purpose of rendering the Naval Service efficient, and rewarding old and meritorious officers." He stated it as his opinion that at 60 years of age the Commanders of line-of-battle ships should be permitted to retire. He proposed that the first one hundred Captains on the list should at once be allowed to retire, which would cause an expense of only 10,000*l.* He held that neither the country or the Navy were safe at present. Either they must allow officers on service to sell out, or give a retired list, or they must begin at once to return to the old system of forty or fifty years ago—of promoting captains to the rank of admirals—not by seniority.—Sir R. PEEL did not think that any good could arise from the adoption of the motion, but, on the contrary, he feared it would be very likely to be productive of evil. The commission of naval and military officers appointed under the late Government, had the subject under their consideration, namely, whether it would be of advantage to the service to clear the retired list of captains of advanced age, and continue the class of officers called Yellow Admirals, and the decided opinion of the commission was that it would not be good policy to do so. He was, therefore, not prepared to spend 17,000*l.* a year on this experiment.—Captain BERKELEY supported the motion. He had himself been thirty years in the service, and how often in that time had he a ship? Only six years and six months, and he was fortunate as compared with many other officers of longer standing. If the list were not cleared, there never could be men fit for service, and the Government might be assured that ere long they would be compelled to accede to the present motion.—After a discussion, in which Sir G. COCKBURN, Capt. PECHELL, Lord INGESTRE, Capt. HARRIS, and Mr. S. HERBERT took part, the House negatived the motion by 71 to 28. The House went into committee on the Isle of Man Customs Acts, and Mr. GLADSTONE moved a new schedule of duties, preparatory to introducing a Bill for regulating the Customs in that island, which was agreed to. The West India Relief Bill was read a second time.

Friday.—After several petitions on various subjects had been presented, and numerous questions of no particular public interest had been answered, Sir R. PEEL, in answer to Mr. EWART, stated with regret that the war between Buenos Ayres and Monte Video was still carried on with uncertain advantages to either side; but he did not think the British Government, or that of France, could interfere with any chance of advantage, or would be justified by the law of nations.—Mr. M GIBSON asked if means of safety for British life and property had been taken?—Sir R. PEEL said, ships-of-war were in attendance, and sufficient precautions taken to protect British interests.—[Left sitting.]

CITY.

Money Market, Friday.—Consols closed at 99¾. Reduced Three per Cents. 98⅝ to ⅞, Three-and-half Reduced 101⅝, and New Three-and-half per Cents. 102¼. Bank Stock, 191-2; India Stock, 286-7; Exchequer-bills have declined to 66-70 pm.

GAZETTE OF THE WEEK.—BANKRUPTS.—T. C. LANCHFIELD, of Augustus-square, Regent's park, builder—J. PLEDGE, of Vauxhall street, Lambeth, bricklayer—W. BURTON, of 28, King-street, Soho, upholsterer—E. HAYWARD, of Castle Hedingham, Essex, innkeeper—J. M. POLAK, of 4, Coleman-street-buildings, City, merchant—J. BAKER, late of Romsey, Hampshire, grocer—E. BRENNAND, of Highgate, ironmonger—J. TODD, senior, and J. TODD, of 7, Bury street, Bloomsbury, ironmongers—E. FOSTER, of Dover, tailor—J. S. AUSTIN, of Bedford, surveyor—E. REEVE, of Liverpool, brewer—J. HOWDEN, of Wakefield, iron founder—R. RICHARDSON, of Manchester, gambroon manufacturer—H. DRAKE, of Barnstaple, Devonshire, attorney-at-law—T. H. WEYMORY, of Worcester, grocer—E. BROWN, of Birmingham, merchant—J. W. HARRIS, of Wolverhampton, wine merchant—E. B. LAMB, Burton-crescent, Middlesex, builder—S BANKS, Ipswich, victualler—R. MASTERMAN, High-street, Southwark, surgeon—P. and J. CATTARNS, Reigate, Surrey, jewellers—T. W. YOUNGHUSBAND, Upper Belgrave-place, bitumen manufacturer—C. NEWTON and C. WORSSAM, Kingsland road, engineers—R. MARKS, Union-street, Southwark, victualler.

SCOTCH SEQUESTRATIONS.—J. JACKSON, of Glasgow, brazier—A. SMITH, Paisley, coach-builder—J. CRAIK, Netherton, Forfarshire, cattle-dealer—D. CRAIK, Auchnacree, Forfarshire, cattle-dealer—J CRAIK, Jun., Balgarrock, cattle-dealer—D. BLACK, Dundee, merchant and spirit-dealer.

Metropolis and its Vicinity.

Dinner at the Mansion-house.—On Wednesday evening the Lord Mayor gave a banquet to her Majesty's Ministers and a numerous assemblage of guests. Among the company were the Lord Chancellor, Lord Wharncliffe, Duke of Buccleuch, Earls of Lincoln, Devon, and Shaftesbury, Lords G. Somerset, Canning, Eliot, Ashley, and Monteagle, Sir R. Peel, Sir J. Graham, the Chancellor of the Exchequer, Sir E. Knatchbull, Mr. Gladstone, the Solicitor-General, Sir G. Clerk, Sir T. Fremantle, the Governor of the Bank of England, the Deputy-Chairman of the East India Company, the Aldermen, &c. After the usual toasts, the Lord Mayor proposed "Her Majesty's Ministers." Sir R. Peel returned thanks. "It was the wish of the Government," he said, "to act in concert with the municipal authorities of the kingdom. There were very few of the Court of Aldermen with whom, in the course of his long official life, he had not had some communication, either in the capacity of sheriff or lord mayor, and he could bear, from personal experience, a willing testimony to the zeal and steadiness with which they discharged their duties. They would be proud, as Ministers of the Crown, if they thought they deserved and possessed the confidence and good opinion of the citizens of London. They had tried, in the discharge of their public duty, to use the influence of this great country for the maintenance of general peace. They were inclined to put an end, as far as they could, to all jealousies and animosities which might have subsisted between this and foreign courts. They had tried to do this without any cession of the interests or dignity of the country; and if peace had been broken in any part of the world, they trusted that, during their administration, the lustre of the British arms had been maintained unimpaired. At home they had tried to maintain the authority of the law without any harsh exercise of the powers which the law had given them, and still more without asking for any new or unconstitutional addition to these powers. They had tried to equalise the public revenue with the expenditure, and to avert the evils of increasing the national debt in a time of peace. They had tried to maintain the public credit, and to exhibit to other nations the truth of that homely, but not less important maxim, that "honesty is the best policy," and that that country which scrupulously maintained its public engagements was not only best consulting its character and its honour, but also acting in a manner most in accordance with the principles of true economy. In carrying out their policy the Government had been supported by the confidence of her most gracious Majesty, who was heart and mind interested in the welfare of her subjects. They had received also the undeviating support of an independent Legislature, and if there were any other source of strength and confidence, and if they could find it in the upholding voice of the city of London—the organ and fitting representative of enlightened public opinion—they would receive everything that was necessary to induce them to persevere in the course which they were pursuing, with the constant hope and expectation that the result would be for the happiness, honour, and welfare of that great community over whose destinies they were called upon to preside." Several other toasts and speeches followed, among which Lord Ashley returned thanks for the House of Commons, and the Solicitor General for the Bar.

General Post Office.—The recent increase in the daily duty of the General Post-office is manifested in every department of that establishment. So greatly is it felt in the newspaper-office, that the authorities have been compelled to resort to every practicable means of assisting the officers by the introduction of mechanical contrivances to lighten the labour of the department. From the bulky size and weight of the double papers, and their great numbers (now nearly 100,000 per night), it is found necessary to make them up in immense sacks, which (the men being unable to carry them) are wheeled upon a tramway to the floor of the omnibuses, whence they are taken to the termini of the several railways. Since the reduction of the rates on letters, the number both inwards

and outwards has materially increased. The three first classes per annum amount to 8,583,040, and the inland letters to 209,611,508. Since the increase of the deliveries of London local letters on the 1st of May the duty has been extraordinarily pressing; and notwithstanding the liberal addition made by the Postmaster-General, all classes in the district-service complain of being over-worked, and several of them are away from duty on the ground of illness. The deliveries from the provinces by mid-day mail also continue to increase, and the money-order service has multiplied 25 times in comparison with what it was before the reduction of the rate of poundage. The acceleration of the mail trains, which came into operation on the Western line on Wednesday last, the projected employment of the Eastern Counties Railway for the conveyance of day bags to Brentwood, Witham, Chelmsford, and Colchester, and the opening of the Canterbury and Dover lines throughout, will tend also to increase the duty, and add materially to the accommodation of the public.

New Asylum for Infant Orphans.—On Wednesday evening a numerous meeting of ladies and gentlemen was held in the Hall of Commerce, for the purpose of forming a new Infant Orphan Asylum. Mr. Hindley, M.P., took the chair, and briefly stated that they had met for the purpose of instituting an asylum which should be free for all sectarianism, the asylum at Wanstead being no longer acceptable to the views of Dissenters, in consequence of the introduction of the Church of England Catechism. The Rev. Dr. Reed then submitted a series of rules and regulations, establishing the society, to be called "The Asylum for Infant Orphans," the design being to board, clothe, nurse, and educate the infant orphan under eight years of age, and until eligible to enjoy the aid of those institutions which provide for the fatherless above that age. Several other gentlemen afterwards addressed the meeting, and in the course of the discussion Dr. Reed stated that the only cause of the present secession from the original asylum was the introduction of the Church Catechism. A liberal subscription was entered into at the close of the meeting.

Anti-Corn-Law League.—The Weekly Meeting of the League took place on Wednesday evening at Covent Garden Theatre. Mr. Bright, M.P., presided, in the absence of the Chairman, Mr. Wilson, who was engaged in the Lancashire Election. The meeting was addressed by Mr. Bright, Mr. J. Wilson, Mr. Turner, a tenant-farmer of Othery, in Somersetshire, and Mr. Burnett, the dissenting minister of Camberwell.

Bank of England.—At an adjourned meeting of the proprietors of Bank Stock on Monday, it was resolved, with only three dissentients, to adopt the recommendation of the Court of Directors to accede to the proposal of her Majesty's Government for the renewal of the privileges of the Bank, provided the general regulations referred to in the letters of the Chancellor of the Exchequer, and proposed to Parliament, be adopted.

Artists' Benevolent Fund.—The annual dinner in support of this fund, for the relief of the widows and orphans of deceased artists, took place on Saturday, at the Freemasons' Tavern. It was attended by upwards of 100 gentlemen, among whom were Lord Palmerston (who presided), Sir A. L. Hay, M.P., Sir J. Easthope, M.P., Hon. R. Colborne, Mr. H. T. Hope, M.P., Mr. C. Dickens, Sir W. C. Ross, R.A., Mr. R. H. Solly, F.R.S., Mr. J. P. Knight, R.A., Mr. C. Stanfield, R.A., Mr. D. Roberts, R.A., and other eminent artists. Lord Palmerston, Mr. Dickens, Sir J. Easthope, and other gentlemen addressed the meeting on behalf of the Society, and subscriptions were announced amounting to 550*l.*

Condition of the Labouring Classes.—On Saturday a public meeting was held at Willis's Rooms for the purpose of forming a Society for improving the condition of the working classes. Lord Ashley presided, and the meeting was addressed by the Rev. H. O'Neile, Mr. Colquhoun, Hanse Town Minister, Mr. R. Slaney, the Rev. G. Bull, Rev. R. Burgess, the Hon. and Rev. S. G. Osborne, Mr. Milnes, M.P., Hon. W. Cowper, Mr. Cabbell, Mr. L. Horner, and the Bishop of Salisbury. Resolutions were adopted, forming a "Society for the improvement of the condition of the labouring classes," embracing the objects of the improvement of the dwellings of the poor, the extension of the cottage allotment system, the formation of friendly loan societies, and the consideration of such other matters as involved the general and permanent welfare of the labouring classes.

Gambling-Houses.—It is stated that in the gambling-houses broken into by the police last week, false dice were found among the gambling implements seized. The brass divisions of the roulette-tables were also, in most instances, so formed as to present an obstruction to the entrance of the ball at the will of the manager of the table.

St. Stephen's, Walbrook.—It is at length arranged between the legal advisers of Mr. Rock and Mr. Alderman Gibbs, that the question of churchwarden shall be tried in the Queen's Bench next term, by means of a feigned action for trespass.

Westminster-bridge.—On the motion of Sir R. H. Inglis, a Parliamentary return has been issued of the sums of money expended in the alterations and repairs of Westminster-bridge, and the probable cost of completion, as also of the income arising from property belonging to the commission. It appears that the total amount of expenditure from the 5th April, 1810, to the 5th April, 1838, was 83,097*l.* 6*s.* 9½*d.* The total amount expended or now due for repairs is stated, since 1838, at 82,661*l.*; and the total amount required for further works is estimated at 52,879*l.* It appears that the total income of the commissioners of the bridge is 7464*l.* 11*s.* 8*d.* Upwards of 200,000*l.* have been expended for the repairs of the bridge since the year 1810, including the estimate for works now required.

Trafalgar Square.—The small portion of this promenade laid down in cement was scarcely completed on the admission of the public, and was consequently not set. Much of it is therefore broken, the portion being that placed between the bitumen, some of which is also broken away. Sticks, stones, umbrellas, and in some cases hammers, were employed by the public to test the solidity of the works; but all these attempts would probably have been successfully resisted had full time been allowed for the cement and bitumen properly to harden. The damage will be repaired by laying down blocks of the like material sufficiently hardened at the manufactory of the patentee, without allowing it to be subjected to the "practical experimentalism" of the public. The basins are again empty to fit on the jets, and although they were filled with water little more than 24 hours, they displayed so large a quantity of rubbish, orange-peel, and brickbats, that it has been necessary to station policemen in the inclosure, lest the Square become the eye-sore of the Metropolis. It is announced that the dinner to the Greenwich pensioners will be given on Friday 24th inst.

Hampton Court.—On Monday Mr. Manning, the coroner of the Queen's household, held an inquest at the Palace, on the mutilated remains of the child, which were recently found in a sewer belonging to the palace, and upon which Mr. Wakley held an inquest on the 7th inst. The unusual circumstance of two inquests being held on the same remains, and the dispute between the county and Crown coroners as to their relative jurisdictions, has greatly increased the interest excited throughout the neighbourhood by the discovery, and the inquest-room was crowded by respectable persons. The evidence, however, was to the same effect as that adduced before Mr. Wakley, and the Jury returned a verdict of "Wilful Murder against some person or persons unknown."

Accidents and Inquests.—Admiral Sir J. Hawkins Whitshed, Bart., now in his 84th year, was knocked down and run over last week by a gentleman's cab, in Hanover-square, and was very seriously injured.—Several fatal accidents occurred on the Thames last week. Among them Mr. Archer Ryland, of the Registrar-General's Office, son of Mr. Ryland, the barrister, was drowned, by his boat striking Putney-bridge, while rowing against another gentleman, from Chelsea to Putney. On the same day, Mr. Charles Wilson, clerk to Sir George Stephen, was drowned, by rowing his boat against the piles of Battersea-bridge. On Saturday, Mr. S. T. Lebatt, partner in the firm of Castellani and Co., the Belgian Consuls, in Copthall-court, was drowned, by being thrown overboard from the Chameleon yacht, at Blackwall, by the shock occasioned by her collision with the Royal Adelaide, Leith steam-ship.

The Battersea Murder.—The prisoner Dalmas has been examined several times since our last, at the Wandsworth Police Court. There was, however, nothing new in the evidence, most of it being merely repetitions of what has already appeared in print. At its close the prisoner said he should reserve his defence, and was committed to Newgate for trial.

Case of Mary Furley.—In reply to an application from Mr. Bright, M.P., in behalf of Mary Furley, Mr. Phillips, Under Secretary for the Home Department, informs that gentleman that Sir James Graham, "under all the circumstances of the case, has felt warranted in advising her Majesty to commute the prisoner's sentence to seven years' transportation."

Mortality of the Metropolis.—The following is the number of Deaths registered in the week ending Saturday, May 4.—West Districts, 140; Northern, 145; Central, 176; Eastern, 198; Southern, 218; Total, 877. Weekly average for the last five years, 946.

Provincial News.

Arundel.—On Saturday evening a Wheat-rick belonging to the Duke of Norfolk, at Park-bottom, near the dairy, was fired by an incendiary and entirely consumed, but by the exertions of the fire brigade the adjoining buildings were saved. This is the first incendiary fire that has ever occurred on his Grace's estate, and great exertions are making to discover the offender.

Birmingham.—A meeting was held in this town on Monday, the Mayor in the chair, at which several resolutions condemning the New Poor Law, and the proposed interference of the Commissioners with local Acts under which the parishioners have the management of their own funds, were unanimously carried, together with a petition to Parliament embodying the resolutions. Several gentlemen addressed the meeting against the New Poor Law, among whom were Mr. Joseph Sturge, Mr. Muntz, M.P., Mr. Scholefield, M.P., and Mr. Oastler.

Bury St. Edmunds.—The outrages upon agricultural property which commenced last winter in Bedfordshire, Cambridgeshire, and Essex, have happily ceased, but in Suffolk the incendiary continues to pursue his occupation with impunity. In one division of the county there is an organised rural police; whilst in the other a well-appointed local constabulary force is maintained. The Secretary of State, at the request of the magistracy, has also sent down some experienced officers of the detective police. The farmers, for the most part, employ nightly watchmen upon their premises, at considerable expense, yet, notwithstanding all these precautions, scarcely a night passes without the recurrence of this outrage. In addition to the long catalogue already reported, no fewer than 12 fires have occurred within the space of as many days. The secrecy with which the crime is almost invariably perpetrated is such as to baffle ordinary vigilance. It is a remarkable fact that in many instances fires break out during the day, whilst the farmer and his servants are on the premises, and in such cases it has been found on examination that ignition has been caused by chemical preparations, deposited in the stack or in the thatched roof of the barn during the previous night, and such preparations having the property of a fusee, will burn for some hours before combustion takes place. This indicates system, and is, perhaps, the most alarming character of these atrocities. Among the most recent fires reported to the magistrates are the barns, outbuildings, &c. on the farm of Mr. R. Kent, of Rattesden Hall; a farmhouse and offices at Thurlow; the entire homestead on the farm of Mr. Corner, at Caddenham; a wheatstack on the premises of Mr. Richardson, of Foulden; the homestead of Mr. Slywood, of Exning; the premises of Mr. Rushbrooke, of the Grange-farm, Chippenham; the dwelling-house, granaries, barns, and stables of Mr. Corsalls, of Dimock's Court; the barns, &c. of Mr. Blake, of Redgrove; the premises of Mr. Belts, at North Lopham; the stacks of Mr. Bowtall, of Haddenham, and the hay-stacks on the farm of Messrs. Folkes, at Barton Mills.

Coventry.—Another murder has been committed in this town on an old man named Clewley, a weaver, in the presence of several witnesses. The evidence at the inquest clearly proved that the murderer was a man named Skelsey, who has consequently been committed for trial on the capital charge.

Lyme Regis.—A disastrous fire broke out in this town on Saturday, the 11th, by which the principal hotel, five other inns, the Custom House, Reading Rooms, and nearly 40 other houses were destroyed. It broke out about 9 A.M. on the premises of a baker in Coombe-street; and the wind being fresh, the engines were unable to check the flames. The damage done is immense, but most of the houses were insured.

Oxford.—A Congregation was held in the University on Wednesday, at which the Vice Chancellor put his absolute *veto* on Mr. Macmullen's degree, on the ground that he had not performed the Exercises appointed by the Regius Professor.

Ware.—The Anti-Tractarian schism which has so long disturbed this town, has at length assumed the character of dissent. The incumbent having demurred to the resolution of his parishioners, the churchwardens have been empowered to proceed against him in the Ecclesiastical Court; and, in order to mark more distinctly their secession from the Church, the Town-hall has been fitted up as a temporary place of worship. The officiating minister is Dr. Robert Alder, a member of the Wesleyan connexion, who officiates without stipend. The Town-hall was opened for the first time on Sunday, the 5th inst., on which occasion a large number of persons attended. The service is in all respects conformable to the usages of the Established Church.

Whitehaven.—The *Carlisle Journal* states that a married woman, residing in Distington, near this town, previous to last week, suffered severely for some months past from a pain in the stomach, and every means adopted for its removal proved of no avail. On Wednesday last however during a fit of coughing, she ejected from her stomach a living reptile, about 12 inches in length, resembling the water-asp, and has ever since been comparatively free from the pain she had hitherto endured. It is conjectured that the reptile had been swallowed in water when very small.

Windsor.—Another attempt to destroy the plantations of firs and young oaks in the Great Park at Windsor, was made last week, but was fortunately discovered in time to prevent the extensive destruction which otherwise must have ensued. The heath, close to the Clock-case, in the Great Park, and but a short distance from the Fishing Temple, at Virginia-water, was discovered by her Majesty's head game-keeper to be on fire, the wind at the time blowing from the north-east. Mr. Maslin, surveyor of Woods and Forests, who was near the spot, instantly summoned all the assistant-keepers, who, aided by several other persons, succeeded in subduing the flames, and preventing their extending beyond 30 or 40 yards from the vicinity where they first ignited. Had not the discovery taken place at so early a period, and before the flames had attained any great ascendancy, the whole of the plantations in this part of the Great Park, extending over nearly 150 acres, and also a great quantity of the game and pheasants' eggs in the preserves, must have been destroyed. We regret to state that no traces of the offenders (who are no doubt part of the same gang who fired upwards of 700 acres of Prince Albert's plantations in the neighbourhood of Bagshot a fortnight ago) have yet been discovered.

Railways.—The following are the returns for the past week:—Birmingham and Derby, 1343*l.*; Birmingham and Gloucester, 2059*l.*; Eastern Counties, 4272*l.*; Edinburgh and Glasgow, 2170*l.*; Great Western, 16,235*l.*; Grand Junction, 9019*l.*; Glasgow, Paisley, and Ayr, 1305*l.*; Great North of England, 1551*l.*; London and Birmingham, 17,991*l.*; South-Western, 6461*l.*; Blackwall, 977*l.*; Greenwich, 866*l.*; Brighton, 3547*l.*; Croydon, 449*l.*; Liverpool and Manchester, 4473*l.*; Manchester, Leeds, and Hull, associated, 3866*l.*; Midland Counties, 2613*l.*; Manchester and Birmingham, 3749*l.*; North Midland, 4406*l.*; Newcastle and Carlisle, 1349*l.*; South-Eastern and Dover, 3846*l.*; Sheffield and Manchester, 620*l.*; York and North Midland, 1653*l.*—An emulation of the example so successfully set by the metropolitan railways for country traffic in the last Easter holidays, cheap railway trips to the metropolis have been announced from Leeds, Derby, and Nottingham, during the

approaching Whitsun holidays. A train is announced to leave Leeds on Whit-Monday the 27th, at 6h. 50m. A.M., and reach London at 5h. 30m. P.M., leaving London on its return, on Thursday the 30th, at 11 A.M.: the fares being from Leeds to London and back, first class 50*s*., and second class, 25*s*. Cheap trains will leave Nottingham for London twice during the Whitsun week, giving the passengers the option of stopping four or eight days; the fares by the second class, there and back, being 28*s*. Cheap trips are also announced, as during the Easter week, by the Dover, Southampton, Brighton, and Colchester Railways.—The most severe contest which has taken place for many years has recently closed between two rival petitions from companies intending to form a railway to Harwich. One emanated from parties supported by Mr. Attwood, the other from the Eastern Counties Company, supported by Mr. Bagshaw. The contest has lasted for 14 days, and has ended in both the Bills being thrown out. The expense thus fruitlessly incurred will amount at least on each side to 12,000*l*.—On Tuesday a meeting was held at Oxford for the purpose of ascertaining the opinions of the leading members of the University, and the principal citizens on a proposed line from the new station on the Great Western Railway at Oxford, to join the Birmingham line at Rugby; Dr. Marsham, warden of Merton College in the chair. The meeting was attended by several gentlemen connected with the Great Western Railroad, by many heads of houses, and other leading members of the University, and by a large number of the most influential inhabitants of the city. The meeting, after hearing Mr. Barlow, one of the directors; Mr. Brunel, the engineer; and Mr. Saunders, Secretary to the Great Western Company, resolved unanimously that the proposed line to Rugby *viâ* Banbury would be most desirable to the University, city, and neighbourhood of Oxford. The proper steps for commencing the line will be immediately taken.

IRELAND.

Dublin.—Various speculations are still indulged in respecting the cause of the unexpected announcement of Chief Justice Pennefather, that he was "sorry" the Court would be unable to pronounce judgment upon the new trial motion until next term, which commences on the 22d inst., and continues for three weeks. By some it is asserted that the judges are equally divided—by others, that Mr. Justice Burton is solely in favour of a new trial. By some it is asserted that there is no division of opinion whatever amongst the judges, that they are unanimous in refusing a new trial, and that they were induced to postpone their judgment on the point by two causes—first, the necessity of devoting the two remaining days of the last term to business pressing upon the Court; and secondly, in order to afford time for preparing their judgments, which are to be given in an elaborate form at the opening of Trinity Term on the 22d inst. The judges, according to this version, are likely to occupy two days at least in announcing their reasons for refusing to disturb the verdict. The usage is for the Chief Justice to express the opinion of the Court when its members are unanimous; but it is said this practice is to be departed from in the present instance. It is however rumoured in other quarters that the whole Court were unanimous in declining to grant the motion for a new trial as against all the parties convicted, with the exception of the Rev. Mr. Tierney; and that Mr. Justice Crompton stands alone, and upon some minor point, with regard to that gentleman. However, all speculations on the matter must be received with caution, and it is supposed that there was some material cause for delay, when the Chief Justice so unequivocally expressed his "sorrow" for the postponement.—Mr. Martley, Queen's Counsel, who presided at the investigation in Shinrone, has presented his report to Government, detailing the recent system of getting up Riband prosecutions in that part of King's County, in which policemen were implicated. The Government have determined upon the dismissal of three of the police, one of them a person of superior station in the force, and also upon the removal to another station of a civil officer holding an appointment in the district.—The landlord and tenant commission have required returns of the number of ejectments filed in the Irish Courts of Queen's Bench, Exchequer, and Common Pleas, during the last five years, distinguishing the tenants served, the counties, and the number of habeases issued thereupon. A weekly journal observes, with respect to this return—"We have reason to believe, that those returns will exhibit a very formidable extent of ejectment—much greater than has been at all calculated upon. Within a single year, in one Court alone, there have been very nearly three thousand ejectments, averaging from ten to fifteen tenements in each ejectment."—The weekly meeting of the Repeal Association took place on Monday in Conciliation Hall, Mr. R. A. Fitzgerald, Ex-Justice of the Peace, in the chair. Mr. O'Neill Daunt gave notice of a motion, to the effect that the Association were of opinion that the proposed abolition of the ancient office of Lord-Lieutenant of Ireland—an office which has been in existence for six centuries—is felt to be degrading and insulting, and as having also a tendency to increase the drain of money from this country, and weaken the attachment of the people to British connexion. Some ordinary business having been transacted, Mr. O'Connell rose for the purpose of alluding to a topic personal to himself, which he would take notice of now for the last time. He was not in the habit of noticing the variegation of newspaper calumny, but he had recently seen a report of a debate in the House of Lords, wherein some contradictory statements had been made by Lords Wharncliffe and Normanby with respect to an offer made to himself. He now wished distinctly to state the facts of the case. In the first place, it was admitted by Lord Normanby himself that he had been offered the Mastership of the Rolls, and on that point there was no controversy. If he had accepted that office, he would have had about 25,000*l*. of the public money in his pockets by this time, but then he would have done nothing for Ireland. It might be the greatest extreme of vanity, but still he thought Ireland wanted him. Now, the question to be decided was, whether he was offered the Mastership of the Rolls or the Chief Baronship, or not. The first was admitted; Lord Normanby denied the latter; but there was this very comical circumstance about the offer—the Rolls were not then vacant, and Lord Normanby had not asked the assent of the gentleman who filled it to make any transfer. When the vacancy occurred in the office, Mr. Woulfe wrote to him (Mr. O'Connell) stating that though the Chief Baronship would be given to him as a matter of routine right, yet he would waive that right altogether if the Government intended to give him (Mr. O'Connell) that office. After that he had the honour of an interview with Lord Normanby, who spoke to him about the vacancy, but he (Mr. O'Connell) interrupted him, and said, "Spare yourself the trouble, my Lord; I do not wish to say anything unpleasant to you, but I will not take any office under Government." He said now that he did not offer him the Chief Baronship. That must be true, as his Lordship said so, and he must be best able to tell what he meant; but it was strange enough that he (Mr. O'Connell) understood it differently, and more so that within a few months after that interview he (Mr. O'Connell) stated in the House, in the presence of Lord John Russell and other members of Government, that the choice had been offered to him, and that statement was not contradicted. Twice he repeated that statement without being set right; and it was really too hard for Lord Normanby, after a lapse of two years, to come out now with a statement to the contrary. After a lengthy address to the Protestants of Ireland, the hon. gentleman alluded to the appointment of Mr. O'Brien. He declared that, "So help him God," he would not take the Repeal of the Union if there was any restriction of any Protestant right of conscience. Mr. O'Connell then informed the audience that he was about to leave them for England, and retired amidst great cheering, which lasted for some minutes. The rent was 453*l*.—The dissolution of the Dublin Conservative Society took place on Monday. Captain W. S. Bull presided on the occasion, and attributed the decay of a society which once numbered 1200 members to the liberalism of Sir Robert Peel's administration, which has paralysed the zeal of Conservatism in Dublin.

Leitrim.—A man named Thomas Nash, residing in the parish of Cloone, in this county, was attacked in his own house, on Sunday week, by a party of five armed men, and murdered on the spot.

Tipperary.—On the 10th inst., Mr. Lee, steward to John Carden, Esq., of Barnabo, near Templemore, was fired at from a plantation, close to which he had to pass. The ball took effect, and lodged in the flesh of the arm, from which it has been extracted. Mr. Lee is a respectable man, and has been for many years in the employment of Mr. Carden. The reason assigned for the outrage is, that he was getting houses levelled from which defaulting tenants had been ejected. Mr. Carden has escaped more than once from assassins on the same lands.

Belfast.—About ten o'clock on Thursday night some persons built across the road to Ballymoney a barricade, from two to three feet high, of large stones, evidently with the intention of upsetting the mail for Belfast. Many hands must have been employed in the work, as it was done in less than thirty minutes. Fortunately the circumstance was made known before the arrival of the coach. An investigation took place next day, and a reward has been offered for the apprehension of the offenders.

Limerick.—On Wednesday night, (says the *Limerick Chronicle*) the surrounding country was illuminated for the supposed triumph of Mr. O'Connell over the Attorney-General in the Court of Queen's Bench!

SCOTLAND.

Edinburgh.—The proceedings of the General Assembly, which will excite great interest under the present circumstances of the Church of Scotland, commenced on Thursday at Edinburgh. The Marquess of Bute, her Majesty's High Commissioner to the General Assembly of the Church of Scotland, will have his residence, levees, and entertainments at the Palace of Holyrood during the sitting of the Assembly. The levees or public entertainments will be held on each day of the Assembly, half an hour before its meeting. His Grace attended divine service in the High Church on Thursday, and will do so on Sunday the 19th, and Sunday the 26th inst.; but there will be no levees or public entertainments at the Palace on the Sundays. The Free Church Assembly meets at Edinburgh at the same time.

Miscellaneous.

The Divisions on the Factories Bill.—Lord Ashley's proposition was sustained in a division on the 18th of March, by 179 to 170, giving a majority of 9 in a House comprising 353 members. On the 22d of the same month that decision was confirmed by 186 to 183, a majority of 3, when 373 members voted. The clause having a similar object, negatived on Monday last by 297 to 150, was decided by a House of 460 members. In the division of March 18, and on that of March 22, Lord Ashley was supported by the following 88 members, whose aid was withheld on Monday last, May 13:—

Acland, T. D.	Emlyn, Visc.	Marton, G.
Adare, Visc.	Fellowes, E.	Maxwell, Hon. J. P
Aldam, W.	French, F.	Mordaunt, Sir J.
Antrobus, E.	Gladstone, Capt.	Muntz, G. F.
Archdall, Capt.	Gore, M.	Neville, R.
Barclay, D.	Gore, W. R. O.	Newport, Visc.
Baskerville, T. B. M.	Goring, C.	Newry, Visc.
Beresford, Major.	Gregory, W. H.	O'Connell, D.
Berkeley, Hon. Capt.	Grimston, Visc.	Packe, C. W.
Blake, M. J.	Grogan, E.	Pakington, J. S.
Buller, C.	Hall, Sir B.	Palmer, G.
Butler, Hon. Col.	Hayes, Sir E.	Palmer, R.
Carew, Hon. R. S.	Hervey, Lord A.	Pennant, Hon. Col.
Cavendish, Hn. C. C.	Holland, R.	Plumridge, Capt.
Cavendish, Hn. G. H.	Hope, A.	Polhill, F.
Chetwode, Sir J.	Horsman, E.	Praed, W. T.
Colville, C. R.	Howard, Hon. C. W.	Rendlesham, Lord
Copeland, Mr. Ald.	Jocelyn, Visc.	Ross, D. R.
Cresswell, B.	Johnstone, Sir J.	Round, C. G.
Curteis, H. B.	Knight, H. G.	Ryder, Hon. G. D.
Dalrymple, Capt.	Knight, F. W.	Smith, A.
Davies, D. A. S.	Law, Hon. C. E.	Smollett, A.
Douglas, J. D. S.	Legh, G. C.	Stanton, W. H.
Duke, Sir J.	Leveson, Lord	Stewart, J.
Duncombe, Hon. O.	Lindsay, H. H.	Sturt, H. C.
Dundas, Adm.	Lowther, J. H.	Taylor, J. A.
Du Pre, C. G.	Macnamara, Major	Trotter, J.
Eaton, R. J.	Mahon, Vics.	Vivian, J. H.
Egerton, Sir P.	Mainwaring, T.	
Ellice, E.	Martin, J.	

Of the above list, the following Members 14 recorded their votes directly in opposition to the proposition which they had previously supported:—

Aldam, W.	Hope, A.	Newry, Viscount
Barclay, D.	Knight, H. Gally	Palmer, G.
Chetwode, Sir J.	Legh, G. C.	Ross, D. R.
Gore, M.	Martin, J.	Trotter, J.
Grimston, Viscount	Maxwell, J. J. P.	

Lord Ashley was supported on Monday by the following 32 Members, who did not vote with him on either of the previous divisions:—

Archbold, R.	Dundas, D.	O'Connell, M.
Barnard, E. G.	Esmond, Sir T.	Philipps, Sir R. B. P.
Benett, J.	Heneage, E.	Pryse, P.
Bernell, Captain	Howard, Sir R.	Redington, T. N.
Blake, M.	Hurst, R. H.	Seale, Sir J. H.
Blandford, Marq. of	Jervis, J.	Sheil, Rt. Hon. R. L.
Brisco, M.	Johnson, General	Smith, B.
Browne, R. D.	Lambton, H.	Somers, J. P.
Chelsea, Viscount	Langton, W. G.	Turnor, C.
Christie, W. D.	Layard, Captain	Watson, W. H.
Corbally, M. E.	Maher, N.	

The Ministry were supported on the last division by 107 Members who had not registered their votes on either of the previous occasions. The Ministerial majority on Monday was 297; from which deduct the 14 voters who had previously declared their assent to the 10-hours principle, 14; actual Ministerial Majority, 283. On Monday there voted with Lord Ashley 159; to this add the 88 who supported him on the 18th and 22d March, 88: actual number for the 10-hours clause, 247; the *real* majority will then only be 36.

The Navies of France and England.—We have stated in our foreign article that some curiosity has been excited in Paris by the publication of a remarkable pamphlet on this subject from the pen of the Prince de Joinville. The following extracts from this work, which appeared in the *Morning Chronicle* of yesterday will, no doubt, interest our readers:—"The steam navy has changed the face of matters. It is now our military resources which will come to take the place of our impoverished naval establishments. We shall always have enough of officers and men for the duties left for a sailor to perform on board a steamer. The engine supplies the place of a hundred hands, and I have no occasion to say that we shall ever feel the want of money for the construction of steam engines, nor of soldiers to fight when they shall be called on to support the honour of the country. With a steam navy the boldest war of aggression on the ocean is permitted. We are sure of our movements, free in our actions. Time, wind, or tides, give us no longer concern: we can calculate to a day or an hour. In case of a continental war, the most unexpected diversions are possible. In a few hours armies can be transported from France into Italy, Holland, or Prussia. What was once done at Ancona with a rapidity which was seconded by the winds, can now be done every day without their assistance, almost against their influence, and with still greater rapidity. As I have already said, these new resources suit us admirably, and the forms of war, thus modified, do not leave the chances as they were thirty years ago between France and the enemies with which she may engage. It is a subject worthy of inquiry to what point the progress of steam and its probable employment excites the attention of our neighbours.—I am not one of those who, in the illusion of national vanity, believe us to be in a state to contend, when both sides are equal, against the British power, neither would I allow it to be said that in any case we could not resist it. My fixed opinion is, that it is possible for us to support a war against any power, even if that power were England; and that by re-establishing a sort of equality in the judicious employment of our resources, if we cannot gain great successes, we can, at least, march with security to what ought to be our object—the maintenance to France of the rank which belongs to her. Our successes will not be striking, because we will take care not to risk all our resources at once, on a decisive contest; but we will make war with security, because we will attack two objects at once, which are equally vulnerable—the confidence of the English people in their insular position, and her maritime commerce. Who can doubt, but that with a steam navy strongly organised, we have the means of inflicting on our enemies' coasts losses and sufferings unknown to a nation which has never felt the

miseries that war brings in its train? And at the close of these miseries, England would suffer from another evil, to which she is equally a stranger, that of lost conquest. The riches accumulated on her coasts and in her ports would have ceased to be placed in security." The Prince goes on to say, that in case of war, the French steam navy would have two theatres of action, the Channel and the Mediterranean. In the latter, France would reign, and would insure the conquest of Algiers, for England is so far from the Mediterranean, that she could not supply her steamers with the necessary fuel, and Malta and Gibraltar would be of little assistance, so that France would be victorious on that theatre, without caring for sailing-ships, which the steamers could always avoid. But in the Atlantic the case is different. England could in a few hours disembark troops on any part of the coast, and could destroy Dunkirk, Boulogne, or Havre, before anything could be done to save them. Even in the Roads of Brest, which were formerly safe, from the difficulty of the navigation, but which difficulty has now disappeared before steam power, the English flag might float. "Thus by the aid of steam," says the Prince, "England is able to menace all our coasts on the Channel, and even to reign in the Mediterranean by cutting off all our communications with Algiers. She could besides effectually and closely blockade all our coasts, and that from this very day if she likes. And to resist her you have but one resource, but one means—that which she uses against us—the establishment of a steam navy." The Prince then shows that the naval force of France is not in a fit state to contend with England. England has 125 war-steamers, of which 77 are armed. She has besides a commercial steam-navy which can supply her, in case of necessity, with 200 steamers capable of carrying heavy cannon and troops. The French steam navy, on the other hand, only dates its origin from 1829, and hardly received any increase till 1840. The danger was then perceived, and an attempt was made to increase the steam-power by the establishment of trans-Atlantic steam-packets, but that project has failed from mismanagement. He does not blame the Chambers, which have given money liberally for the establishment of steam-power, but he blames the administration, which, unhappily, instead of constructing ships, seems only to think of supplying the means of *repairing* a force which, as yet, has no existence. He goes on then to show the parts which the different portions of the naval force ought to take in defence of the state. "The steam power would be employed to guard the coasts of the kingdom, and to keep up a surveillance on the coasts of Great Britain, and to guard and protect the conquests of France in the Mediterranean. Sailing ships would, at the same time, be used on distant stations: but in that case it would be necessary to employ more ships on those stations than are employed at present. At the present time France has only forty-gun frigates, with a crew of 300 men, on stations where England and America have fifty-gun ships with crews of 500. On each station there ought to be two or three frigates, under the command of an admiral, "instead of the small vessels now employed, which are to our diplomatic agents a source of insult, and which, in the very first brush of a war, would be destroyed by the first hostile frigate that happened to fall in with them." And he concludes by saying, he hopes he has established that it is only by a strong steam navy that the power and dignity of the country can be supported.

Tithe Commission.—The following report has been presented to the Secretary of State, signed by Messrs. Blamire, Buller, and Jones, the Tithe Commissioners:—Tithe Commission Office, April 2, 1844. Sir,—It is our duty to report to you the progress of the commutation of tithes in England and Wales, to the close of the year 1843. We have received notices that voluntary proceedings have commenced in 9555 tithe districts; of these notices 45 were received during the year 1843. We have received 6877 agreements, and confirmed 6492; of these 183 have been received, and 281 confirmed, during the year 1843. 3871 notices for making awards have been issued, of which 836 were issued during the year 1843. We have received 2681 drafts of compulsory awards, and confirmed 2172; of these 675 have been received, and 559 confirmed, during the year 1843. We have received 7525 apportionments, and confirmed 6881; of these 1074 have been received, and 1186 confirmed, during the year 1843. In 8664 tithe districts, as will be seen from the above statement, the rent-charges to be hereafter paid have been finally established by confirmed agreements or confirmed awards. We have in our possession voluntary agreements and drafts of awards, as yet unconfirmed, which will include 891 additional tithe districts; and make a total, when completed, of 9558 districts in which the tithes are commuted. We have to repeat the assurance which we have happily been able to give in every report, that the whole process of commutation is proceeding tranquilly and harmoniously. The district of South Wales may appear to form an exception. As far, however, as we can judge from our own correspondence, and our other means of information, very little discontent has existed between the real parties to the commutation, that is, the landowners and titheowners. The occupying tenantry, however, have found grounds of complaint, in many cases not unreasonable; they are called on to pay rent-charges, the majority of which have been agreed to by their landlords, though a smaller portion have been awarded by us. Those rent-charges are very peculiarly low, and on the average do not greatly exceed one-tenth of the rent, or of the net value, instead of amounting to one-tenth of the gross value of the produce. Still, low as they are, these rent-charges somewhat exceed the compositions which the tenants calculated on paying when they hired their farms and fixed their terms with the landlord. The task of apportioning still goes on more slowly than it was calculated it would do when the Commutation Act passed; but it continues to be effected, as it has all along been, with much less difficulty and irritation than it was supposed would accompany it. Much of the work which remains for us to do begins to assume a character which makes it advisable to draw your attention to some of its peculiarities and difficulties. In many parishes in which the great bulk of the tithes have been commuted on inclosure or otherwise, farm or district moduses have been left, which in the present state of the law it will become our duty to convert into rent-charges; and we must, partially at least, map and apportion on the lands subject to them. The expenses of such apportionment to the landowners will first be extravagant, when compared with the amount of the sum apportioned, and then the expenses of collecting will make the rent-charge valueless to the tithe-owner. It seems to us that, in these cases, a permission to redeem these payments for money, and thus to avoid the expenses both of apportionment and collection, would be advantageous, and indeed is requisite to protect both parties. The managers of Queen Anne's Bounty are willing, we believe, to receive the redemption money; and if they are directed to apply it as they do augmentation moneys, it may partially and gradually be invested in land, if that seems desirable for the tithe-owner. The operation of such a measure might, perhaps, usefully be somewhat extended. In many cases of vicarial tithe, the individual payments are so minute as to convert the collection of them into a loss. We have even been requested to strike a mass of them out of rent-charges, because, as the tithe-owner will be taxed upon the gross amount of them, and be certain not to receive them, the nominally giving them to him is substantially mulcting them. The redemption of such small payments would clearly be a boon to the tithe-owner, and as the liability to them is often felt to be a disagreeable incumbrance by the owners of property, the power of redeeming them would be, in very many cases, also considered a boon. The state of the law, as modified by 2 & 3 Will. IV., c. 100, commonly called Lord Tenterden's Act, impedes our progress, and, unless cleared up, threatens to protract the close of our labours. In some hundreds of cases, and, indeed, in an indefinite number, we cannot give decisions as to the contested rights of parties with any confidence that those decisions are correct. Our own legal assistants are divided in opinion, and we are told that this division of opinion extends even to the superior Courts; at any rate, no decision of those Courts on the cases now before them has been obtained. We are led to hope that some distinct decision may be given before the close of this year; if this is not the case, we may be driven to request the assistance of the Legislature. Whatever the law may turn out to be, those cases will many of them be obstinately litigated, and if our dealing with them is much longer postponed, the delays of issues and new trials, and of the apportionments which must follow them, may postpone what would otherwise be the term of our labours. In the case of parishes containing open fields, where the tithes have been commuted and the rent-charges apportioned before inclosure, the re-apportionment of those rent-charges on the inclosed lands newly appropriated to individuals is always desirable, and, indeed, almost indispensable. We have no power to sanction this at present. We think such a power might conveniently be given us. The exercise of a similar power, after the close of our commission, may be provided for by an Act, which, for that and other purposes, it will be necessary to pass before the tithe commission ceases to exist. In a number of parishes, heretofore inclosed by Act of Parliament, we have reason to believe that the provisions for extinguishing tithe have been in some cases wrongly, in others imperfectly, carried out. If tithe litigation and tithe are to cease with the commission, some provision must be made for correcting the errors, or completing the deficiencies of these inclosure transactions. Some of the railroads, one of the most extensive in particular, that is the Great Western, refuse to pay the rent-charges apportioned on the lands over which they pass. It is illegal to seize and carry away the rail, so that the titheowner's remedy by distress is nugatory, unless there is a station in his district. His remaining remedy is to take possession of the ground over which the road passes; but as it is illegal for him to stop up a public way, his possession is useless to him, unless he resorts to the doubtful benefit of a suit in equity, to compel an account of the profits made on the portion of railroad in his legal possession. We think that the owner of the rent-charge should not be driven to this experiment, but that whenever a rent-charge is clearly due from the railroad company, it should be recoverable by distress on the property of the company, on whatever part of the line found. This would not increase the legal liability of the company. They might still, by replevin or otherwise, dispute the legality of the rent-charge; only, when they did not so dispute it, they would be compelled to pay the owners of rent-charges in districts where there is no station, and where those owners have no other remedy than a suit in equity.—We have the honour to be, &c.

African Guano.—The *Liverpool Standard* states that the ship Britannia, Captain E. Wylie, left Ichoboe, on the west coast of Africa, whither she had been for guano, on the 7th February, and arrived at that port on Sunday week with a cargo of that article. The captain reports that on the 17th January, a "mummy" was dug out of the guano, and close upon it there was a common Oak stave, with the inscription "Columbus Delano, 1791," cut apparently with an ordinary scribe for marking wood. It was found only four feet below the surface, and no idea could be formed of the depth at which it had originally been buried; so that supposing it to have been merely covered under the then level, the accumulation of the guano over the intermediate period of 53 years, could not have much exceeded two-and-a-half to three feet. It is remarkable that the body was in a state of perfect preservation, and equally so was the canvass in which it was inclosed, being perfectly fresh and strong.

Currents of the Atlantic.—On the 15th May, 1838, the Andromache, 28, Captain Baines, on her passage from Plymouth to Quebec, threw a sealed bottle overboard, in lat. 47 N., and 35 W., about half-way between Ushant and New York. After floating about for five years and ten months, it was recently picked up in the port of Isabella, in the island of Porto Rico.

Phenomena of Sound.—Many remarkable sounds in nature are produced by repeated reflection from surfaces. In some situations the sound of a cascade is concentrated by the surface of a neighbouring cave, that a person accidentally entering it is startled at the uproar. In the gardens of Les Rochas, once the well-known residence of Madame de Sevigné, is a remarkable echo, which illustrates finely the conducting and reverberating powers of a flat surface. The Château des Rochas is situated not far from the interesting and ancient town of Vitre. A broad gravel walk on a dead flat conducts through the garden to the house. In the centre of this, on a particular spot, the listener is placed at the distance of about ten or twelve yards from another person, who, similarly placed, addresses him in a low, and, in the common acceptation of the term, *inaudible* whisper, when "Lo! what myriads rise!" for immediately from thousands and tens of thousands of invisible tongues starting from the earth beneath, or as if every pebble was gifted with powers of speech, the sentence is repeated with a slight hissing sound, not unlike the whirling of small shot passing through the air. On removing from this spot, however trifling the distance, the intensity of the repetition is sensibly diminished, and within a few feet ceases to be heard. Under the idea that the ground was hollow beneath, the soil has been dug up to a considerable depth, but without discovering any clue to the solution of the mystery. On looking round for any external cause, the observer who has supplied this description says, "I felt inclined to attribute the phenomenon to the reflecting powers of a semicircular low garden wall, a few yards in rear of the listener, and in front of the speaker, although there was no apparent connexion between the transmission of sound from the gravel walk and this wall. The gardener, however, to whom I suggested this, assured me that I was wrong, since within his memory the wall had been taken down and rebuilt, and that in the interim there was no perceptible alteration in the unaccountable evolution of these singular sounds."—*Morning Post.*

Law.

JUDICIAL COMMITTEE OF PRIVY COUNCIL.—*Piggott* v. *Bearblock and Newman.*—This was an appeal from the Arches' Court. In that court Mr. Piggott, an inhabitant of Romford, Essex, was proceeded against by Messrs. Bearblock and Newman, as churchwardens of that parish, for the recovery of two sums of 3*s.* 4*d.* and 5*s.*, assessed upon him for the support of the parish church, and the payment of expenses relating thereto, by two church-rates made in 1839 and 1840. Piggott, who is a poor shoemaker, applied to be permitted to defend himself *in formâ pauperis*, but this application was rejected by Sir H. Jenner Fust. Piggott then defended himself personally; but Sir H. Jenner Fust ultimately decided against him, condemning him in the payment of the two rates, with costs. From this decision Piggott prosecuted the present appeal, also in person, but at the hearing was assisted by Mr. Roebuck and Mr. Mellor, of the common law bar, against Dr. Addams, who defended the judgment of Sir H. Jenner Fust. After hearing Counsel, Lord Brougham gave judgment reversing the decision of the Court below, on the ground that the payment out of the rates of money previously borrowed, or expended, was illegal, and would vitiate those rates. An illegal payment of an amount, however small, would have that effect. In Hampden's celebrated case the illegal amount was but a few shillings; but, even take the accounts as you would, the sums objected to constituted a sixth of the whole rates. The case of "Queen v. Dursley" was conclusive; for if the *mandamus* had been granted, it would have been equivalent to a declaration that the rate in question would be good; but the *mandamus* having been refused, the conclusion was equally clear that the rate would be bad. The Court in that case did not make or lay down any new law, but only declared the law as it existed before the statute, that if retrospective the rate was bad. Upon this ground, therefore, their Lordships had come to the conclusion that they had no option but to reverse the judgment appealed from, including, of course, that part of it which condemned Mr. Piggott in the payment of costs in the court below; but as he had defended himself, and therefore incurred but trifling expenses on his own account, their Lordships, under the circumstances, had not thought it necessary to make any award of costs to him. Judgment of the Court below was, therefore, reversed, but no costs given on either side.

COURT OF EXCHEQUER.—*Excise Prosecutions.—The Attorney-General* v. *Cole.*—This was an information charging defendant with having in his possession a quantity of malt combings for the purpose of adulterating tobacco. Mr. Jervis stated, that this was a case in which the Crown sought to recover penalties under the statute 3 & 4 Victoria, c. 18, the 11th section of which enacted that no person should cut, colour, stain, or manufacture any leaves of trees, herbs, or plants whatsoever, not being tobacco leaves or plant, into the form of, or to imitate or resemble, tobacco, on pain of forfeiting 100*l.* Defendant was a tobacco manufacturer, residing at Bradford, in Yorkshire, who now appeared in person to dispute the legality of three seizures of malt combings, which had been made in July, August, and October, 1841, and in respect of which, as was contended by the Excise, he had incurred the penalty above mentioned. The facts were undisputed, the defendant never having denied that the articles in question were his property, or the purpose for which he had manufactured them, but it was understood that he rested his defence on a point of law, it being contended by him that malt combings came neither under the description of leaves of trees, herbs, or plants; and that as the use of them was expressly prohibited by a subsequent statute, 5 & 6 Victoria, it might fairly be inferred that they were purposely omitted in the former one. These "malt combings," however, were "plants." They were the vegetated roots of the barley, which are first encouraged and then checked and cut off from the

grain in the process of making malt; and if they were not a plant, then it was difficult to say that any part of a plant could be so termed. This was the whole case, and it would be for the jury, under the direction of the Judge, to deal with it as they might be advised. Counsel then briefly proved the seizure of the three parcels of malt combings at Bradford, at a railway, where the process of colouring and dyeing was going on, and at Wakefield railway station, and defendant's warehouses in London, where it was kept all ready for delivery to various large tobacconists in London, for the purpose, as the defendant termed it, of "reducing their tobacco." When produced in court, there was no visible difference between it and the purest tobacco, but being sold by defendant to the trade at 1*s.* per lb., and being then mixed by them in the proportions of 1 to 2 with the genuine plant, which paid a duty of 12*s.* per lb., it is evident that, however innoxious the mixture might be to the deceived smoker, the injury to the revenue was very extensive, it being shown that defendant had actually contracted with one firm of professed "importers of genuine tobacco" for the delivery of one ton per month. At the close of the case, Mr. Cole, in person, submitted that the information had failed, on the ground already alluded to; but Mr. Baron Gurney was of opinion that the article in question came under the designation of a "plant," or, in the words of the information, "the vegetated roots of a certain plant called barley," and that the defendant was therefore amenable to the statute under which the charge was framed. The defendant then shortly addressed the jury, contending that if he had erred, he had been misled by the act, and that he was therefore entitled to their favourable consideration. The jury, however, without much hesitation, found a verdict for the Crown, which was taken for two penalties of 100*l.* each.—*Attorney-General* v. *Gates and others.*—This was an information filed at the instance of the Excise, for the recovery of certain penalties alleged to have been incurred by defendants by means of having unlawfully and fraudulently unshipped certain quantities of tobacco stalks and manufactured tobacco, without the due payment of the duty. The single value of the tobacco was laid at 2000*l.*, and the amount, therefore, to which the defendants had rendered themselves liable, was 6000*l.*, being treble that sum. There were, however, other counts in the information, under each of which the defendants were liable to further penalties. It appeared that the quantity which had been seized consisted of 102 bales, containing 13,317 pounds, one cask holding 169 pounds of manufactured, and one trunk holding 103 pounds of the like article. The seizure was made on the 19th May, 1842, at the Paddington terminus of the Great Western Railway. A further seizure was also made on the 21st of the same month, at the warehouses of Messrs. Tanner, Hantwell, and Co., in Whitecross-street. The defendant Gates was a master mariner and the owner of a small smack at Southsea, but at the present period is in Winchester Gaol for the penalties. His vessel had sailed from Portsmouth on the pretence of going to another port in England, but had gone to Jersey instead, and there taken in the contraband cargo. The jury returned a verdict for the Crown, with penalties on the fourth count for the single value of the goods, 2000*l.*, on the first count, for unshipping without payment of duty, or without a permit, 200*l.*; and on the third count a penalty of 50*l.*; in all, 2250*l.*—*Attorney-General* v. *Cox.*—This was an information for an infringement of the statute relating to the manufacture and sale of paper. The case was undefended. It was proved that defendant, who is a paper-maker at Boulden, near Hungerford, had sold paper that had not been charged to the duty, that he had altered the weight of the parcel as originally marked on the stamped wrapper, and that he had sent out and sold paper in considerable quantities without any wrapper having been placed round the package, all these acts being violations of the act of Parliament. The jury returned a verdict for the Crown for penalties amounting to 560*l.*—Mr. *William Wainwright*, of No. 58, Fore-street, Moorgate, tobacconist and billiard-table keeper, was charged with adulterating snuff, and having adulterating matter in his possession. There were four counts in the information, varying the offence, and laying the penalty in each count at 200*l.* A fifth count charged defendant with having tobacco in a room not entered, subjecting him to a penalty of 100*l.* A Custom-house officer stated, that in consequence of the increase of Chinsura cheroots at the various tobacconists in London, and the fact that only two chests had paid duty in the port of London for the last ten years, the officers were looking sharp after them. On the 29th December witness, accompanied by two other officers, visited defendant's premises, and discovered a box full of the Chinsuras in the back parlour. During the search witness discovered a large box of snuff, and a sieve filled with the same; he tasted the contents, and finding them grossly adulterated, he examined several of the jars in the shop and seized them. The shopwoman told witness it was all brown rappee. Witness then proceeded to search the house, and took up some of the flooring in the billiard-room. He broke open a cupboard, where he found bottles, glasses, measures, some bottles of port, sherry, and champagne, and about thirty dozens of stout. There were cupboards on every floor filled with stout, containing altogether about 80 dozens. Witness only seized the spirits, cheroots, and snuff. Defendant said he could show invoices for the cheroots, and produced one in which he had introduced the word "Chinsura;" they were charged at 7*s.* 6*d.* per pound. The duty on Chinsura cheroots was 9*s.* per lb., and 5*l.* per cent. Defendant told witness he had introduced the word to cover the goods, as there had been such a disturbance in town about them. Mr. G. Phillips, Professor of chemistry, deposed that he had tested the articles. The snuff in the box was a powder closely resembling brown rappee, but did not contain a particle of tobacco; it consisted of vegetable matter, common salt and earthy matter. The contents of the jars were adulterated with earth, sand, potash, and salt, and the net adulteration was 22 1-6th per cent. Witness handed a sample out of the box to the commissioners, which did not contain a particle of tobacco, but had the appearance of brown rappee. The shopwoman swore that defendant never mixed his snuffs, and that they purchased them of Mr. Victor, of Holborn, who said he had nothing to lose. They sold a small quantity of it, and then put it aside, as they found out it was not good. The Court said it was a very bad case, and fined the defendant 100*l.*

SPORTING.

TATTERSALL'S, THURSDAY.—Derby.—8 to 1 agst. Colonel Peel's lot (taken); 20 to 1 agst. Mr. Ford's lot (taken); 9 to 4 agst. Mr. J. Day's Ugly Buck (taken); 10 to 3 agst. Mr. Crockford's Ratan (taken); 12 to 1 agst. Mr. Scott's Bay Momus (taken); 13 to 1 agst. Colonel Peel's Orlando; 20 to 1 agst. Lichtwald's Leander (taken); 20 to 1 agst. Sir G. Heathcote's Akbar; 30 to 1 agst. Mr. Ford's Qui Tam; 50 to 1 agst. Mr. Ford's Phalaris; 100 to 1 agst. Mr. M. Jones's British Tar.—The arrival of Ratan in town, *en route* for Epsom, coupled with a report that he is perfectly well, completely restored him to favour; 700 to 200 was taken three times, and 10 to 3 to at least 1000*l.*, this too in addition to some heavy bets at the West end on Wednesday night. The Ugly Buck was not less in demand, 5 to 2 having been taken once in hundreds, and 9 to 4 to nearly 2000*l.*! The new favourite, Bay Momus, was backed freely at 12 to 1. OAKS.—7 to 1 agst. Mr. Osbaldeston's Sister to Martingale; 7 to 1 agst. Mr. Gregory's Barricade; 8 to 1 agst. Lord Chesterfield's The Princess (taken); 12 to 1 agst. Lord Exeter's Merope (taken); 12 to 1 agst. Lord G. Bentinck's All-round-my-Hat (taken); 20 to 1 agst. Baron Rothschild's Emerald (taken); 20 to 1 agst. Mr. Rawlinson's Charming Kate; 25 to 1 agst. Colonel Anson's The Bee (taken); 30 to 1 agst. Colonel Anson's Buzz (taken); 40 to 1 agst. Sir R. Bulkeley's Coal Black Rose (taken).

BIRTHS.—On the 11th inst., at Kemptown, Brighton, the lady of Sir W. FOLLETT, M.P., of a son—11th inst., the lady of W. H. MAUND, Esq., of the Hill, Laverstock, Wilts, of a son—11th inst., in Endsleigh-street, Tavistock-square, Mrs. W. HARMAR, of a son—11th inst., at the house of her father, J. Somes, Esq., New-grove, Mile End, the lady of T. COLYER, Esq., of Parrock-hall, Milton, of a daughter—11th inst., in St. James's-square, Bath, the lady of J. W. WHITTICK, Esq., of a son—11th inst., at Guildford, Mrs. J. T. SELLS, of a daughter—12th inst., at 2, Camden-cottages, Camden New-town, the lady of T. T. à BECKETT, Esq., of Golden-square, of a son—12th inst., at Villa Etruria, St. John's Wood, the lady of J. M'ADAM, Esq., of a son—12th inst., at Dulwich, the lady of T. STEVENS, Esq., of a daughter—12th inst., in the Precincts, Canterbury, the lady of the Rev. G. WALLACE, of twin sons—12th inst., at 31, Duncan-terrace, Islington, Mrs. LEECH, of a son—12th inst., at Charlton, Mrs. J. SAUNDERS, of a daughter—13th inst., the lady of R. De B. LOPEZ, Esq., of a son—13th inst., at 19, Southampton-street, Fitzroy-square, Mrs. W. HUMBY, of a daughter.

MARRIED.—On the 26th of February last, at Calcutta, W. MAPLES, Esq., Bengal Civil Service, second son of T. F. Maples, Esq., of Crouch-end, Hornsey, to HENRIETTA WEST, MACOTT, third daughter of H. Westmacott, Esq., of Finchley, Middlesex—7th inst., at Streatham Church, E. Foss, Esq., to MARIA ELIZ. HUTCHINS, eldest daughter of William Hutchins, Esq., of Hanover-square—8th inst., at the house of her Majesty's Envoy Extraordinary and Minister Plenipotentiary, Frankfort on-the-Maine, A. FARRE, M.D., of Curzon-st. Mayfair, to JESSIE B. MACDONALD, eldest daughter of Lieut.-Colonel Macdonald, C.B. and K. St. A., late commanding her Majesty's 35th Regiment, and formerly of the Royals—9th inst., at Walcot Church, Bath, W. P. CUST, Esq., eldest son of the Hon. W. Cust, to EMMA M. CHAPLIN, only child of the late W. Chaplin, Esq., formerly Commissioner of the Deccan—11th inst., at Banbury, E. COBB, Esq., of Calthorpe-house, to OCTAVIA PIPER, daughter of the Rev. H. H. Piper, of that place—11th inst., at Christ Church, Marylebone, Mr. H. S. BILLAM, to ELIZ. HEWELL, the youngest daughter of S. Hewell, Esq., of St. John's Wood, London—9th inst., at Charlton Church, J. G. MOYLE, Esq., of the 10th Regiment, Bombay Army, eldest son of J. G. Moyle, Esq., of Boulton-house, Charlton Kings, and late President of the Medical Board, Bombay, to BESSIE Ross, eldest daughter of F. Ross, Esq., of Clarence-square, Cheltenham.

DIED.—On the 31st of March, at St. Kitt's, of yellow fever, after six days' suffering, T. C. M. LETHBRIDGE, Esq., Lieut. 85th Lt. Inf., eldest son of J. H. Lethbridge, Esq., and grandson of Sir T. B. Lethbridge, Bart., of Sandhill-park, Somerset—27th ult., at Lisbon, GENERAL SIR T. W. STUBBS—Lately, at Tenterden, Mr. L. HOLDEN, probably the oldest Dissenting minister in the kingdom, having discharged the pastoral office to one congregation seventy years, aged 91—2d inst., at Bath, WM. BECKFORD, Esq., author of "Vathek," and formerly proprietor of Fonthill Abbey, aged 84—Lately, SIR J. LOWTHER, Bart., at Swillington-hall, near Leeds, aged 85. He was the son of the Rev. Sir W. Lowther, Bart., rector of Swillington, and Ann, his wife, a descendant of the ancient family of the Zouches—4th inst., at Scottow, Norfolk, FRANCES A. S. DURRANT, the youngest daughter of Sir Henry and Lady Durrant, aged 18 months—6th inst., at Southampton-row, New-road, after a long illness, R. MORRELL, Esq., aged 41; also, on the 2d March, at Calcutta, T. P. MORRELL, Esq., aged 37, sons of the late Lieut.-Colonel Robert Morrell, of the Bengal Army—6th inst., at Bengeworth, Worcestershire, Mr. M. W. THOMAS, only son of the late John Thomas, Esq., of Liverpool, aged 60—7th inst., in the Close, Salisbury, MAGDALEN BOWLES, the wife of the Rev. W. L. Bowles, one of the Canons Residentiary—8th inst., at Kensington-terrace, CATHERINE RICE, widow of the late Rev. Dr. Rice, of St. Luke's, Finsbury, aged 70—9th inst., at Tunbridge Wells, ELIZ. THOMSON, eldest daughter of the late Rev. R. Thomson, LL.D., of Long Stow-hall, Cambridgeshire—10th inst., at Elmgrove, North-road, Exeter, CATHERINE VOWELL, relict of Maj. Vowell, of the 88th Reg., and third daughter of the late Charles Maxwell, Esq., of Dalwinston, near Dumfries, aged 72—10th inst., at Tunbridge-wells, MARY SKINNER, relict of the late R. Skinner, Esq., aged 72—11th inst., at 21, Bankstown, Sheerness, Mrs. DUFF, of Corsindae, Aberdeenshire—11th inst., at Bedford, C. SHORT, Esq., aged 75—11th inst., at Richmond, HELEN DEARE, widow of the Rev. J. R. Deare, vicar of Bures, Suffolk—11th inst., in St. Peter's-place, Brighton, ANN GOLDING, relict of the late W. Golding, Esq., of Reading, Berks, aged 70—11th inst., at his residence, 14, Brownlow-street, Holborn, W. J. WHITE, engraver and printseller, and a member of the Goldsmith's Company, aged 66—On board her Majesty's ship Albatross, in the West Indies, of yellow fever, J. E. NICHOLAS, Esq., Volunteer of the First Class—20th ult., at Cairo, on the overland route from India, E. BANNERMAN, Esq., late of the East India Company's Madras Civil Service—14th inst., at 39, Oxford-terrace, Hyde Park, G. A. WINGFIELD, Esq., barrister-at-law, third son of the late J. Wingfield, D.D., prebendary of Worcester Cathedral.

FELIX SUMMERLY'S HOME TREASURY OF BOOKS, PICTURES, TOYS, &c.; purposed to cultivate the Affections, Fancy, Imagination, and Taste of Children.

Toys just Published:

BOX OF 10 BEST COLOURS FOR LITTLE PAINTERS, with Hints and Specimens. 6*s.* 6*d.*

TESSELATED PASTIME, with numerous Patterns. 6*s.* and above.

Books just Published:

JACK AND THE BEAN-STALK; A New Edition, with 4 NEW Pictures. 3*s.* 6*d.* and 2*s.*

THE PLEASANT HISTORY OF REYNARD THE FOX, told by Everdingen's 40 Pictures. 6*s.* 6*d.*

BIBLE EVENTS, with 8 Pictures by Holbein. 4*s.* 6*d.* and 2*s.* 6*d.*

LITTLE RED RIDING HOOD, with 4 new Pictures. 3*s.* 6*d.* and 2*s.*

BALLADS OF CHEVY CHASE, with 4 New Pictures. 4*s.* 6*d.* and 2*s.*

BEAUTY AND THE BEAST, with 4 New Pictures. 3*s.* 6*d.* and 2*s.*

TRADITIONAL NURSERY SONGS, with 8 New Pictures. 4*s.* 6*d.* and 2*s.* 6*d.*

SIR HORNBOOK; an Allegorical Ballad, with 8 Pictures. 4*s.* 6*d.* and 2*s.* 6*d.*

The *Athenæum* recommends them as a Bouquet of Flowers "immortals" as the Florists would call them; for they are not subject to change, and will be fresh and fragrant at Christmas, or on New Year's Day, or at Easter, or on any other or all holiday seasons.

In preparation:

PORTFOLIO OF PICTURES, Ancient and Modern, Coloured and Plain, for Copies, 7*s.* 6*d.*

BOX OF TERRA COTTA BRICKS, Geometrically made, 10*s.* 6*d.* and upwards.

Published by JOSEPH CUNDALL, 12, Old Bond-street, London.

Bound in cloth, price 5*s.* 6*d.*

JOE MILLER'S JEST-BOOK

A Reprint from the first and genuine Edition, such omissions and alterations only having been made as were required by the greater delicacy observed in modern conversation; but, that the volume might have some substance, and be a good table or travelling book, copious additions have been made from other old volumes of Facetiæ.

Extract from the Preface.

"Another strange circumstance connected with this work is that everybody presumes that he himself and everybody else are perfectly familiar with its contents . . . and yet, if the reader will ask his acquaintance, it will appear that not one in five hundred ever set eyes on a copy. It is in consequence of like questions that this edition is published."

London: WHITTAKER and Co.

REED of a superior quality for Cottages Orné, Swiss Cottages, Lodges, Dairies, Meat-Safes, Aviaries, Farm Buildings, and other Horticultural and Agricultural Purposes, may be obtained on application to Mr. LARKE, Ramsey, Huntingdon.

SILVER TEA-SERVICES.—A. B. SAVORY and SONS, Manufacturing Silversmiths, 14, Cornhill, London, opposite the Bank of England, submit the price of the following Silver Tea and Coffee Services. The Cottage Pattern is plain, standing on shell feet, the tea and coffee-pot with a flower ornament on the lids. The King's Pattern is richly embossed with flowers and scrolls. The shape of either is new and elegant.

Cottage Pattern.			*King's Pattern.*		
Strong Silver Tea-pot	£12	0*s.*	Strong Silver Tea-pot	£12	0*s.*
Ditto Sugar-basin	6	15	Ditto Sugar-basin	7	10
Ditto Milk Ewer	4	10	Ditto Cream Ewer	5	10

A variety of upwards of 50 tea and coffee services may be seen in the show-rooms, where may be selected every article of silver requisite for the side-board or plate-chest. Pamphlets of prices, illustrated with sketches of the various articles, gratis, and forwarded, postage-free, to any part of the kingdom.—A. B. SAVORY and SONS, 14, Cornhill, London, opposite the Bank of England.

HOTHOUSES, CONSERVATORIES, &c., made and fixed Complete in all parts of the Kingdom. One, two, and three-light Cucumber and Melon-Boxes and Lights of all sizes kept ready for immediate use, packed and sent to all parts of the Kingdom; warranted best material. Two-light Boxes and Lights complete, from 1*l.* 8*s.* Garden-Lights made and glazed from 1*s.* per foot, at JAS. WATTS, Sash Manufactory, Claremont-place, Old Kent-road.

*** Reference given.

INTERESTING TO LADIES.—To MESSRS. ROWLAND & SON, 20, Hatton Garden, London.—"Percy Place, Landport, Portsmouth, April 4, 1844. GENTLEMEN,—I think it but an act of justice to inform you of the benefit I have derived from the use of your admirable Macassar Oil. About six months ago I found my hair getting daily more weak and thin, and much discoloured from a practice I had adopted of wetting it continually; fearing that I should lose it entirely, and hearing of the efficacy of your Macassar Oil, I have for some time past constantly used it, and the result is, that my hair is now perfectly restored and much improved in appearance and colour, having become thick, dark and glossy; it also curls freely without the use of paper, which it never did before. To all my friends I have warmly recommended your Macassar Oil as an excellent restorative and preservative for the Hair. As I have an objection to see my name in print, I beg you will not publish it; but you are at liberty to show this letter, or make any other use you please of it, and refer applicants to me if necessary, in proof of the efficacy of your Macassar Oil. Your Obt. Servant ***"

ROWLAND'S MACASSAR OIL preserves and reproduces the Hair; prevents it from falling off or turning Gray; changes Gray Hair to its original colour; frees it from Scurf and Dandriff, and makes it beautifully soft and curly.

*** Ask for "ROWLAND'S MACASSAR OIL." All others are Fraudulent Counterfeits.

WANTED, a single Man, for a small place in Surrey, who perfectly understands Breeding and Rearing Game. He must be able to fill up his time either as a jobbing Carpenter or Gardener. No answer noticed unless with full particulars of age, wages required, &c.—Direct to A. B., Mr. Manicorn, Baker, South Molton-street, Oxford-street.

WANTED, a steady, respectable Man (in-door servant), as GROOM and GARDENER; his character must be unexceptionable.—Apply to A. B., Post-office, Gosford, near Axford.

WANTED, in the neighbourhood of London, a GARDENER, who thoroughly understands his business, particularly the forcing of Vines and Pines. He must be a steady active married Man, but little encumbrance would be preferred. Direct to X., Messrs. FLANAGAN'S, opposite the Mansion House.

WANT PLACES.—All Letters to be post-paid.

AS GARDENER.—A single Man, aged 34, who has a thorough practical knowledge of his business, and can have six years' good character from the place he has just left. No objection to a single-handed place.—Direct to C. B., Mr. Kernan, Seedsman, 4, Great Russell-street, Covent garden.

TO NOBLEMEN AND GENTLEMEN.

AS GARDENER.—A married Man, without children, who is fully competent, by practical experience in Horticulture, to undertake any situation, however extensive; is well versed in the management of Pines, Peaches, Grapes, and Greenhouse Plants, Framing, and Kitchen Gardening; the Laying-out of Pleasure-grounds and Planting on the most extensive scale. Can be highly recommended by the Nobleman he has lived with six years, who is at present in London.—A single-handed situation will not be accepted. No office-keeper need apply.—Direct to B. B., No. 3, Charles-place, Kensington-square.

AS GARDENER AND FORESTER.—A middle-aged single man, of active and industrious habits; has a thorough knowledge of Horticulture in all its branches; is conversant with Accounts and Garden Architecture; has had extensive practice in the cultivation, propagation, and forcing of Plants; has particularly excelled in Grape culture, in pots as well as rafters; is thoroughly acquainted with Hamilton's system of Pine Growing, which enables one or more splendid fruit to be cut annually from the same plant, and the succession plants entirely dispensed with. Has a ten years' excellent character. No objection to any part of the kingdom. For further reference apply to J. HAMILTON, Thornfield, Stockport.

AS GARDENER.—A Married Man, without incumbrance, aged 32, who has a practical knowledge of his business in all its branches; character unexceptionable. No single-handed place will be accepted. Direct A. P., Mr. IVERY, Rye-lane, Peckham, near London.

AS COACHMAN and GARDENER, or GROOM and GARDENER.—A respectable married Man, aged 28, who can have two years good character from the person he has just left.—Direct to A. B., Post office, Sandhurst, Kent.

AS GARDENER.—JOHN CLARK, late Gardener for upwards of 13 years to Charles Taylour, Esq., Parkfield, Liverpool, wishes to obtain a Situation, and begs respectfully to refer any Nobleman or Gentleman requiring the service of a Gardener to his late employer for abilities in Gardening in all its branches, Management of Land, Plantations, &c.—Direct to W. SKIRVING, Queen-square, Liverpool.

AS GARDENER.—A single Man, who understands his business in all its branches. Wages not so much an object as a comfortable Situation. No objection to a single-handed place, or to go abroad, or to superintend a Nursery. Can be highly recommended.—Direct to H.P., at Mr. TOOLEY'S, Nurserymen, Stockwell.

A LADY, of middle age, and who has high testimonials, wishes to Engage with a Family wherein the services of an Experienced Matron would be valuable.—Direct to M. S., 4, Swallow-street, Piccadilly.

ROYAL BOTANIC SOCIETY, REGENT'S PARK.

EXHIBITIONS of PLANTS, FLOWERS, and MICROSCOPES in the GARDENS of this SOCIETY, for 1844.

TUESDAY, June 4.
TUESDAY, July 2.

Fellows, Members, and Bearers of Ivory Tickets, will be admitted upon entering their names in the Gate Book. Visitors may obtain Tickets at 5*s*. each, except on the days of the Exhibitions, when they will be 7*s*. 6*d*. each, by orders from Fellows and Members only.

Should the weather prove wet, a New Gate connected with the Tents will be opened, so that Company may view the Plants without being incommoded by Rain.

Tickets and further particulars at the Gardens.

GARDENERS' BENEVOLENT INSTITUTION.

Notice is hereby given, that the Half-yearly General Meeting of the Subscribers to this Institution will be held on TUESDAY, 4th JUNE next, for the purpose of receiving the Report of the Sub-Committee appointed for "the Revision of the Bye Laws;" also, for the election of Four Poor Persons, Sixty Years of Age and upwards, to the benefit of a Pension of 16*l* per annum. The Chair to be taken at Half-past Eleven o'clock precisely. The Ballot will commence at TWELVE o'clock, and close at Two o'clock precisely.

LIST OF CANDIDATES.

1. SAMUEL LYWARD, third application, aged 66.
2. JOHN BLAYLOCK, second application, aged 72.
3. ELIZABETH COLLYER, second application, aged 70.
4. ROBERT CRACKNELL, first application, aged 72.
5. GEORGE MARTIN, first application, aged 66.
6. ALEXANDER UPTON, first application, aged 75.
7. JOHN WELLARD, first application, aged 71.

Any Subscriber not having received his Polling Paper, is requested to apply for it immediately.

E. R. CUTLER, Secretary, 97, Farringdon-street.

GARDENERS' BENEVOLENT INSTITUTION.—WILLIAM BARNES begs leave to inform his Friends and the Subscribers to the above Institution generally, that the case which he has ventured to recommend to their notice at the ensuing Election of Pensioners is that of JOHN WELLARD, of Eynsford, Kent, to whose claims, on the score of infirmity, poverty, and past good conduct, he can bear the strictest testimony.—Bromley Common, May 23, 1844.

SPLENDID LARGE, DEEP-BLUE ANAGALLIS and SUPERB CINERARIAS.—Plants of that large, splendid deep-blue, full and complete round-petalled ANAGALLIS BREWERII, being of a strong and vigorous habit, are well adapted for bedding out; 12*s*. per dozen.

SUPERB CINERARIA SEED, saved from the most esteemed named kinds, and other new and beautiful Seedlings, comprising every shade of dark and light-blue, at 2*s*. 6*d*. per packet. Strong flowering plants of the above, 12*s*. per dozen. Applications, including Post-office orders, will be immediately executed.—Direct to MICHAEL BREWER, Sen., Cambridge Nursery.

PLANTS FOR BEDDING OUT, to be had of MARNOCK & MANLEY, NURSERYMEN, Hackney, London.

	per doz.—*s*.	*s*.
Geraniums, scarlet and others, strong plants	6	to 9
Fuchsias, 100 varieties	6	12
Verbenas do.	4	6
Petunias	4	6
Malva decumbens, new	9	
Salvias,—in varieties	4	6
Hoovardias do.	6	9

With every other variety of Bed and Creeping Plants, at moderate prices, sent free within 10 miles of London, if to the amount of 20*s*. and upwards, or packed for the country. A descriptive Catalogue maybe had on application.—Nursery, Hackney May 24.

GLOXINIA ROSEA ALBA; Figured in the present Number of the "Florists' Journal."

EXTRACT.—"Our present illustration, G. rosea alba, is an hybrid obtained from seed of *candida*, impregnated with the pollen of *rubra*. Its beautiful intermediate colour at once proclaims its origin; and we have no doubt it will speedily become a favourite."—*Florists' Journal*, May 1, 1844, by the Editor.

The flower is of a lovely and delicate rose colour, with a pure white throat; habit of G. rubra, and a prolific bloomer.

Strong Plants now ready for sending out, at 7*s*. 6*d*. each; discount to the trade, if three plants are taken. Apply to Wm. E. RENDLE, Union Road Nursery, Plymouth.—May 24, 1844.

A GRAND HORTICULTURAL EXHIBITION, Under the Patronage of His Royal Highness the DUKE OF CAMBRIDGE, K.G., and the Right Rev. the Lord BISHOP OF ROCHESTER, in aid of the Funds of the GARDENERS' BENEVOLENT INSTITUTION, will be held in the Grounds of the Bishop of Rochester, adjoining the White Hart Hotel, Bromley, Kent, on TUESDAY, 11th June next.

The following Prizes have been kindly offered:—

By Mr. GEORGE CHARLWOOD, *of Covent Garden*.—For the Best General Collection of Plants, a copy of the late Mr. Loudon's celebrated Botanical Work, the "Arboretum Britannicum," value Ten Guineas.

By Mr. LOW, *of Clapton*.

	£	*s*.	*d*.

The Committee take this opportunity of earnestly soliciting the aid and co-operation of all persons desirous of promoting the interests of the Institution.

E. R. CUTLER, Secretary, 97, Farringdon-street.

N.B.—Arrangements have been made at Bromley for the accommodation of exhibitors, horses, and men, at the expense of the Committee.

CARNATIONS.—Any person having two or three healthy Pairs of Colcutt's "BRUTUS" in pots will hear of a purchaser by applying to Mr. THOMAS REHAD FENTON, Stoke-upon-Trent, Staffordshire.

PANSY, "LADY ALICE PEEL."—In every respect one of the best Show-Flowers of the present year; raised by Youell & Co. in 1843. Blooms were submitted for the opinion of the Editor of the *Gardener's Chronicle*, a description of which will be found under "Notices to Correspondents," in *Gardeners' Chronicle* of April 27, page 248.

Strong plants are now ready for sending out, post free, at 3*s*. 6*d*. per plant.—Great Yarmouth Nursery, May 24, 1844.

SPLENDID NEW SEEDLING LOBELIAS.

F. C. BALL, NURSERYMAN, Taunton, (successor to Mr. JOHN YOUNG,) begs to offer the following as decidedly the best Scarlet Lobelias known, viz.:—

Lobelia fulgens multiflora.
,, ,, ,, variety.
,, ,, pyramidales.

All partaking of the free growth of L. ignea, and in colour and size of flower far exceeding the vivid scarlet of L. fungens; particularly the first, which is also very desirable from its robust habit and long continuance in bloom. Last season in the greenhouse its flowers were conspicuous for four months. Plants are ready for immediate delivery, price 5*s*. each.—May 23, 1844.

CLOTH OF GOLD NOISETTE ROSE.—Mr. CURTIS having a strong Stock of this very desirable novelty, begs to offer good Plants at 10*s*. 6*d*. each. Carriage of Packages paid to London per Great Western Rail.

West of England Rose Nursery, Moorend, near Bristol.

NEW AND SUPERB CHRYSANTHEMUMS.

YOUELL AND CO. beg to call attention to the following select List of CHRYSANTHEMUMS; the plants are strong and healthy, and ready to be forwarded per Post free to any part of the United Kingdom, at 12*s*. per dozen, the selection being left to the purchaser or to Y. and Co. They will be found very desirable to those who intend exhibiting at the Autumnal Exhibitions.

Achmet Bey, lilac	Lucidum, white
Arago, buff and red	Marchioness, white
Beauty, pale lilac	Madame Pompadour, dark rose
Belladonna, pink	Marechale Messina, yellow and red
Bethula, lilac	Marie, red
Campestroni, purple	Marie Antoinette
Casimir Perrier, small, crimson	Magnet, yellow
Chancellor, white and pink	Memnon, pink
Changeable, yellow	Minerva, pink and white
Christophe Colombe, lilac	Mirabile, white and buff
Col. Combes, salmon	Peter, creamy
Conspicuum	Perspicuum, pink
Defiance, white	Princess Marie, light pink
Duc de Conigliano, crimson	Pulcherrimum, rose
Duchess de Montebello	Queen, deep rose
Duke, extra fine	Quilled, yellow
Elegans, rose	Rosalind, pink
Empress, lilac	Salters, white
Expanded, purple	Sulphurea
Flechier, dark rose	Sultana, rose
Formosum, white and yellow	Superb, clustered yellow
Golden Lotus, flowered yellow	Surprise, white
Gem, pink and white	Starry, purple
Goliath, white	Tasselled, lilac
Gouvain St. Cyr, orange	Hero ,, yellow
Incurved, pink	Triumphant, pink and buff
Insigne, pink and red	Two coloured incurved, yellow and brown
Imperial, pale lilac	Vesta, white
King, pale rose	Wheeleriana.
Louis-Philippe	

Sent Post-free to any part of the United Kingdom, at 12*s*. per doz.

"HATCH'S PINK SUPPORT."—This admirable invention has been submitted for the opinion of Dr. LINDLEY, and the remarks upon it will be found in this Paper of the 11th inst., page 300. It entirely does away with the unsightly appearance of sticks, a vast quantity of unnecessary trouble, and also serves the purpose of carding and keeping the flower in form; and, with care, the article will last many years. Price 4*s*. 6*d*. per dozen. Great Yarmouth Nursery, May 23, 1844.

R. WHITE & Co. beg now to offer Plants of the following, viz., Achimenes longiflora, strong Plants for specimens on their own bottoms, at 2*s*. each; Do. do., good flowering Plants at 9*s*. per dozen. Achimenes grandiflora, strong specimen roots, 3*s*. 6*d*. each; Do., smaller, 2*s*. A. pedunculata, do., 1*s*. each; A. coccinea, do., specimen, 9*s*. per doz. A. rosea, do. do., 9*s*. per dozen. ANAGALLIS BREWERII, 1*s*. each, or 9*s*. per dozen. CHRYSANTHEMUMS, 40 superb varieties, one plant of each, 21*s*. DAHLIAS, including all the finest old varieties, and the following new ones, viz., Standard of Perfection, Orange Superb, Lady Antrobus, Emma Noke, Madame Chevain, Essex Triumph, Oakley's Surprise, Antagonist, Blue Bonnet, Queen of the Isles, &c. &c., at very moderate rates, or where the selection is left to us, at 10*s*. 6*d*. per dozen, or 50*s*. per 100, which may include the last-named five new kinds, and will be made up with other really good sorts.

FUCHSIAS—London Rival, Globosa Grandiflora, Espartero, Stanwelliana, Prince of Wales, Monarch, Bridegroom, Integrifolia, Kentish Hero, and all the other new kinds, at moderate prices, or a Collection of 20 superb kinds, including some of the new ones, and any of the following, viz., Venus victrix, Exoniensis, Laucii, Greenwich Rival, Magnifica, Gigantica grandiflora, St. Clare, Bruciana, Eximia, Woodsii, Conspicua, Arborea, Devonia, Splendens, Youellii, Formosa elegans, &c., for 21*s*., or 10 for 10*s*. 6*d*.

GERANIUMS in superb collections, 40 good varieties, 63*s*.; 20 do. do., 42*s*.

PETUNIAS, good sorts, per dozen, 4*s*. The following new varieties:—Punctata, Beauty Supreme, Celestial, Formosa, Ne plus Ultra, Splendida, Speciosissima, Multiflora punicea, Gem, Superb, 21*s*. the Collection, or separately at moderate rates.

VERBENAS.—Finest old varieties, per doz., 4*s*. The following are seedlings, viz.:—White's Wonder, Perfection, Modesty, Variabilis, Cooperii, Surprise, Simperii, Stewart's Queen of the Whites, Azurea grandiflora, Carnea superba, Pearson's Teucroides atrosanguinea, do. Princess Alice, Speciosissima, Beauty Supreme, Teucroides cœlestina, Miller's Blue Queen, Zeuxis, Smith's Excelsa, Array, Delicata, and Striata—the Collection, 31*s*. 6*d*.

Scarlet Geraniums, Heliotropes, Calceolarias, &c. &c., for bedding out; and every description of plant at moderate prices.

Orders from unknown correspondents must be accompanied by remittance; and orders amounting to 5*l*. will be delivered free.—Bone Manure—Dust, 20*s*., Mixed, 19*s*. per qr.; Guano, 11*s*. per cwt., or 10*l*. per ton, warranted genuine. Agents, by appointment, for the sale of Whitney's Composition.

Poole Nursery, Dorsetshire.

WM. JOHN CORMACK, AGRICULTURAL SEEDSMAN by Appointment to His Royal Highness PRINCE ALBERT, New Cross, Surrey, and Bedford Conservatory, Covent Garden, begs to call the attention of the Nobility, Gentry, and Agriculturists in general to his combinations of GRASS SEEDS for Permanent Pasture, the Alternate Husbandry, Parks, Lawns, &c. (as recommended and practised by his partner, the late Mr. GEORGE SINCLAIR, Author of the "Hortus Graminens Woburnensis.") Upwards of 25,000 acres have been converted to permanent pasture by this establishment with the greatest success. Parties requiring Seeds are respectfully requested to state the nature of the soils. Mangold Wurzel, Carrot, and Turnip-seed of excellent sorts, saved from transplanted bulbs. Garden and Agricultural Seeds of the best quality and most approved kinds.

N.B.—Cormack's British Queen and Prince Albert Peas, at 3*s*. 6*d*. per quart.

LYNDON'S PATENT GARDEN SPADES.—These excellent Spades, warranted to bear a knife edge, and wear as long as three Spades made in the usual way, are sold by JOHN SHEWEN, Ironmonger, Sevenoaks, to whom orders may be addressed, and will receive prompt attention.

HORTICULTURAL SOCIETY OF LONDON.—EXHIBITIONS AT THE GARDEN.

INSTRUCTIONS TO THE JUDGES AS TO THEIR CONSIDERATION OF THE NOVELTY OF THE OBJECTS EXHIBITED.

In forming your opinion of the subjects submitted to you for examination, you are requested to take into consideration whether they have been exhibited previously or not. The OBJECT of this regulation is to give specimens produced at the Society's Garden Meetings, for the first time, an advantage over others previously exhibited, although of equal merit; and to obstruct the system of exhibiting very fine plants repeatedly, to the disadvantage of others. The EFFECT of this regulation should be,—1. That if two collections should be nearly the same in point of merit otherwise, that in which no previously exhibited specimen shall be found, will be regarded as the better of the two. 2. That in all cases of doubt, the person who had not exhibited previously shall have the benefit of the doubt. 3. That when each of two competitors shall have introduced previously-exhibited plants into his collection, that collection which contains the fewest of them shall be deemed the superior if they are otherwise nearly alike. It is not, however, wished that the previous exhibition of plants should depreciate their value so much as to place a superior collection below one very decidedly inferior. The APPLICATION of this regulation is left to your judicious consideration.

AWARD OF THE JUDGES, MAY 18th, 1844.

LARGE GOLD MEDAL.

1 To Mr. Mylam, Gardener to Sigismund Rucker, Esq., Jun., F.H.S., for a collection of Exotic Orchidaceæ.

GOLD KNIGHTIAN MEDAL.

1 To Mr. Clarke, Gardener to the Earl of Eldon, at Shirley Park, Croydon, for a collection of 15 Stove and Greenhouse Plants
2 To Mr. Bruce, Gardener to Boyd Miller, Esq., for a collection of 6 Stove and Greenhouse Plants
To Mr. Robertson, for a collection of Stove and Greenhouse Climbers
4 To Mr. Gaines, of Battersea, for 12 varieties of Pelargonium, in pots of 24 to the cast
5 To Mr. Dobson, for the same
6 To Mr. Gaines, for 12 varieties of Pelargonium, in pots of 12 to the cast
7 To Mr. Cock, for the same
8 To Mr. Laing, Nurseryman, Twickenham, for a collection of 25 Roses in pots
9 To Alexander Rowland, Esq., F.H.S., for a collection of 12 Roses in pots
10 To Mr. Williams, Gardener to C. B. Warner, Esq., F.H.S., for a collection of Exotic Orchidaceæ
11 To Mr. Robertson, for a collection of 20 species of Cape Heaths
12 To Mr. J. Dawson, of Brixton, for the same
13 To Mr. T. Jackson, F.H.S., for the same
14 To Mr. Vockes, Gardener to J. J. Wells, Esq., of Bromley, Kent, for a collection of 6 species of Cape Heaths
15 To Mr. Frazer, of Leyton, Essex, for the same
16 To Mr. Falconer, Gardener to Archdale Palmer, Esq., of Cheam, for 12 Greenhouse Azaleas
17 To Mr. Robertson, for 6 Greenhouse Azaleas
18 To Mr. Upright, Gardener to G. C. Ridge, Esq., for Tall Cacti in flower
19 To Mr. Booth, Gardener to Sir Charles Lemon, Bart., F.H.S., for Cereus crenatus
20 To Mr. J. Wilmot, for Grapes
21 To Mrs. Knott, of Bohun Lodge, Barnet, for the same.

LARGE SILVER MEDAL.

1 To Mr. Frazer, of Leyton, for a collection of 6 species of Stove and Greenhouse Plants
2 To Mr. Catleugh, for 12 varieties of Pelargonium, in pots of 24 to the cast
3 To Mr. Staines, for the same
4 To Mr. Bell, of Chelsea Hospital, for 12 varieties of Pelargonium, in pots of 12 to the cast
5 To Mr. Catleugh, for the same
6 To Mr. Stanly, Gardener to H. Berens, Esq., F.H.S., for 6 Calceolarias, in pots of 12 to the cast
7 To Mr. Cole, Gardener to C. Lewis, Esq., of Blackheath, for 12 varieties of Fuchsia
8 To Messrs. Lane and Son, for a collection of Roses, in 50 varieties
9 To Mr. Green, for a collection of 20 species of Cape Heaths
10 To Mr. Bruce, for a collection of 6 species of Cape Heaths
11 To Mr. Gaines, of Battersea, for 12 Greenhouse Azaleas
12 To Mr. Bruce, for Tall Cacti in flower
13 To Mr. Robertson, for the same
14 To Messrs. Veitch and Co., of Exeter, for Hindsia violacea
15 To Mr. Moore, Gardener to R. Hanbury, Esq., F.H.S., for a new variety of Schomburgkia tibicinis
16 To Mr. Williams, Gardener to C. B. Warner, Esq., F.H.S., for Plants grown in a Glass Case on Mr. Ward's plan
17 To Mr. Dodds, Gardener to Sir George Warrender, Bart., F.H.S., for a miscellaneous collection of Fruit
18 To the same, for Grapes
19 To Mr. Wortley, Gardener to I. F. Maubert, Esq., F.H.S., for Grapes
20 To Mr. J. Davis, of Oak Hill, East Barnet, for the same
21 To Mr. G. Leslie, Gardener to J. Fleming, Esq., F.H.S., for Pine Apples.

SILVER KNIGHTIAN MEDAL.

1 To Mr. Stanly, for a collection of 6 Stove and Greenhouse Plants
2 To Mr. Frazer, for a collection of 6 Stove and Greenhouse Climbers
3 To Mr. J. Mitchell, Piltdown Nursery, Maresfield, for a collection of Roses, in 25 varieties
4 To Mr. Gaines, for 6 Calceolarias, in pots of twelve to the cast
5 To Mr. Catleugh, for a collection of 12 varieties of Fuchsia
6 To Mr. Edmonds, Gardener to His Grace the Duke of Devonshire, at Chiswick, for Peristeria pendula
7 To Messrs. Veitch and Son, of Exeter, for Eriostemon buxifolium
8 To Messrs. Veitch and Son, for Erica depressa
9 To Mr. Green, for Ixora coccinea
10 To Mr. Bruce, for Pimelea spectabilis
11 To Mr. G. Clarke, Gardener to the Earl of Eldon, for Leschenaultia formosa
12 To Mr. Robertson, for Stephanotus floribundus
13 To Messrs. Veitch and Son, for a new species of Centrosema
14 To Messrs. Loddiges, of Hackney, for a species of Gaylussacia
15 To Mr. W. Brazier, for the best-named collection, (no error in 20 plants, and well written.)
16 To Mr. Sellers, Gardener to L. V. Watkins, Esq., F.H.S., for Grapes
17 To Mr. Mitchell, of Kemp Town, Brighton, for the same
18 To Mr. Braid, Gardener to H. Perkins, Esq., F.H.S., for Pine Apples
19 To Mr. Ewing, Gardener to O. F. Meyrick, Esq., F.H.S., for Cherries
20 To Mr. Spencer, for Strawberries (British Queen)
21 To Mr. Gadd, of Betchworth, near Dorking, for 5 Melons
22 To Mr. Falconer, Gardener to A. Palmer, Esq., for Azalea variegata
23 To the same, for Leschenaultia grandiflora.

THE SILVER BANKSIAN MEDAL.

1 To Mr. Catleugh, for a collection of 25 Roses in pots
2 To A. Rowland, Esq., F.H.S., for a collection of Roses in 25 varieties
3 To Mr. Ivery, of Peckham, for 12 varieties of Cineraria in pots
4 To Messrs. Veitch and Son, for Xanthosia rotundifolia
5 To the same, for Hindsia (Rondeletia) longiflora
6 To Mr. Forrest, for Statice macrophylla
7 To Mr. Robertson, for Cereus speciosissimus
8 To the same, for Gompholobium polymorphum
9 To the same, for Eriostemon buxifolium
10 To Mr. Noble, Gardener to R. Mangles, Esq., F.H.S., for a new species of Hibbertia
11 To Mr. Robertson, for the second best-named collection (two errors in 36 plants, and very nicely written)
12 To Mr. McLean, Gardener to the Marquess of Downshire, for Grapes
13 To Mr. Atlee, Gardener to H. Beaufoy, Esq., of South Lambeth, for the same
14 To Mr. Snow, Gardener to the Earl de Grey, for Melons
15 To Mr. Dodds, for Strawberries (British Queen)
16 To Mr. I. Davis, of Oakhill, for the same
17 To R. Brook, Esq., F.H.S., for Apples, &c.

THE CERTIFICATE OF MERIT.

1 To Messrs. Lawrence, of Parliament-street, for Plants grown under a bell-glass on Mr. Ward's plan
2 To Mr. Bruce, for Adenandra speciosa
3 To the same, for Siphocampylus betulifolius
4 To Mr. Whomes, Gardener to E. Foster, Esq., of Clewer, for a Seedling Pelargonium, (Dr. Lindley)
5 To Mr. I. Ivery, of Betchworth, for a Seedling Azalea (formosa)
6 To Mr. Catleugh, for a Seedling Azalea (conspicua rosea)
7 To Mr. Frost, Gardener to Lady Grenville, for Cumingia trimaculata
8 To Mr. Mylam, for the third best-named collection, (four errors in 36 plants, and beautifully written)
9 To Mr. Rollisson, of Tooting, for the fourth best-named collection, (four errors in 20 (?) plants, and well written)
10 To Mr. W. Davis, of Isleworth, for Strawberries (British Queen)

*** The Judges of the Plants exhibited as new or extremely rare single specimens, expressed their regret that, owing to mis-entries, they were unable to confer rewards upon some deserving exhibitors.

GREAT YARMOUTH NURSERY. NORFOLK, 1844.

YOUELL AND CO.,

PATRONISED BY HER MOST GRACIOUS MAJESTY THE QUEEN; HIS MAJESTY THE KING OF THE BELGIANS; NURSERYMEN AND FLORISTS BY SPECIAL APPOINTMENT TO HER MAJESTY THE QUEEN DOWAGER.

NOW READY FOR SENDING OUT.
THE NEWEST AND VERY BEST FUCHSIAS, VERBENAS, PETUNIAS, ANAGALLIS, &c.
FOR 1844.

YOUELL AND Co. beg to refer the Readers of the *Gardeners' Chronicle* to their Catalogue of the above, which appeared in this Paper of the 27th of April, and will be found to contain such varieties only as are worthy of cultivation.

YOUELL & Co. being the parties who first sent out per post, with safety, these tribes of plants, are desirous of calling attention to their advantageous method of executing orders, namely, that they will deliver them free of postage (on the receipt of a Post-office order), to any part of the United Kingdom, upon the following terms:—

12 Extra Fine varieties, 12*s.*, the Selection left to Youell & Co.
12 ditto ditto 21*s.*, the Selection left to the Purchaser.
50 Fine varieties . . 40*s.*, the Selection left to Youell & Co.
50 Extra Fine ditto . 60*s.*, the Selection left to the Purchaser.

VERBENAS.

12 Extra fine Varieties, 6*s.*, the selection left to Youell & Co.
12 Ditto ,, 10*s.*, the selection left to the purchaser.

PANSIES. [Sent postage free.]

12 Fine Show Varieties, by name . . 10*s.* per dozen
12 Extra Fine ditto, do. . . 18*s.* ,,

CHRYSANTHEMUMS. [Sent postage free.]

Fifty of the newest best varieties by name, 12*s.* per dozen; for list and colours of which, see Advertisement of April 27.

FLOWER-SEEDS.—30 Packets of the choicest and newest kinds sent per post free for 6*s.*

ARAUCARIA IMBRICATA IN POTS.

Recently planted most extensively at Her Majesty's Gardens at Windsor, and also at the Royal Gardens, Claremont, furnished by YOUELL and Co.

YOUELL AND Co., possessing the most extensive stock in the country of the above Splendid Hardy Ornamental Tree, beg to offer them on the following advantageous terms:—Fine robust 4-year-old plants, 8 to 10 inches high, 10*l.* per 100, or 30*s.* per dozen.

Fine Plants of CEDRUS DEODARA, in Pots, 2ft. to 2ft. 8 ins., 10*s.* 6*d.* each.

Great Yarmouth Nursery, May 23, 1844.

N.B. All Orders above £2 are delivered carriage free to London or Hull, or plants added to compensate for the same.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

THE following Articles, manufactured in Slate for Horticultural purposes, may be seen in use at Worton Cottage, upon application to the gardener (Sundays excepted).

Tank Covers
Cisterns
Shelves
Garden Edging
Bottoms for Frames
Boxes for Balconies and Verandahs
Orange Tubs, Flower Boxes, &c.

EDWARD BECK will be happy to answer any inquiries, either personally or by post.

HORTICULTURAL IMPROVEMENTS. — As Spring approaches the larvæ of destructive insects are propagated in infinite multitudes, and impregnate with millions of insects the very air we breathe, to the great injury of the young shoots of trees, vines, plants, and every species of vegetation put into motion and growth by the genial influence of the season.

J. READ begs to inform Noblemen, Gentlemen, Nurserymen, and practical Gardeners, that he has now a variety of his NEW PATENT HYDRAULIC MACHINES, for the purpose of suduing these destructive insects, which make such deadly havoc on all trees and plants (particularly the Peach and Nectarine), at this season of the year. These machines are made of various dimensions, suitable for every purpose of Horticulture, and are worked with such ease, that a Lady may enjoy the pleasure of watering her plants and flowers without the least fatigue, and the water may be dispersed in the form of a gentle shower or dewfall. The above are so constructed as to require but two-thirds the labour of any other machines now in use, when the Patentee, from thirty-one years' practical experience in the science of Horticulture, and twenty-one years in manufacturing and improving machines, can safely warrant.

Likewise, FIRE-ENGINES made to order, capable of discharging from 20 to 40, 70, or 120 gallons of water per minute, which may be seen and proved at 35, REGENT-CIRCUS, PICCADILLY.

IRON WORKS.

COTTAM AND HALLEN, WINSLEY-STREET, OXFORD-STREET, LONDON.

GARDEN ROLLERS and RICK-STANDS, or STATHELS, at very low prices.

GARDEN SYRINGES, 9*s.* 6*d.* each.

HAND-GLASS FRAMES for Cucumbers, &c., 18 inches square, 20 inches, and 22 inches.

CAST-IRON FLOWER-STAKES, 4 ft. long out of the ground, 4 ft. 6 in., 5 ft., 6 ft., and 7 ft.

Watering-pots, Garden Engines, Mowing Machines, Garden Chairs, Superior Garden Tools of all kinds, Garden Vases in great variety, and every description of article used in Horticulture.

BEST WIRE, for STRAINED WIRE-FENCING, at 8*s.* 6*d.* per bundle of 150 to 160 yards each.

Flower-bordering, Trainers, Garden Arches, Flower-stands, Rose-tree Guards, and every description of Ornamental Wire-work, for Gardens, &c.

HOTHOUSES, CONSERVATORIES, &c., made upon the most improved principle, either of iron or of iron and wood combined, which can be fixed complete in any part of the Kingdom, at very low prices.

HOT-WATER APPARATUS for heating Hothouses, Conservatories, and Greenhouses; Churches, Public or Private Buildings, &c., with COTTAM'S PATENT, or ROGERS'S BOILERS. After 15 years' experience, and having fixed upwards of 1500 Apparatus for the above-mentioned purposes, and by various improvements which they have made during that time.

RENDLE'S TANK SYSTEM on an improved simple plan.

Show Rooms at their Manufactory, No. 2, Winsley-street, where estimates and every information may be obtained.

RENDLE'S TANK SYSTEM OF HEATING.

STEPHENSON AND CO., 61, Gracechurch-street, London, Inventors of the IMPROVED CONICAL and DOUBLE CYLINDRICAL BOILERS, having been much engaged in heating buildings upon the above system with Tanks of various materials, solicit the attention of scientific Horticulturists to an Iron Tank now fitting up on their premises, which offers most decided advantages over every other article hitherto employed for the same purpose. These tanks, which are ornamental in appearance, can be made from 10 to 100 feet long and of any width and depth, and can be connected or disconnected by any working Gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of employing this much approved method of heating without the assistance of Engineers. The Tanks can be applied to Boilers and Pipes already fixed, and from the present low price of Iron will be found cheaper than of any other material. MR. RENDLE, of Plymouth, has kindly undertaken to receive orders and furnish information to any persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

HORTICULTURAL BUILDING & HEATING by HOT WATER.

J. WEEKS and Co., ARCHITECTS, &c., Gloucester-place, King's-road, Chelsea, Hothouse-Builders, and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry, that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER.

CONICAL and other BOILERS of all sizes; their largest consumes but a small quantity of fuel, only requiring attention once in 10 hours, and will heat a range of Forcing-houses 300 feet in length.

Their improved plan of BOTTOM-HEAT FOR PITS, by means of an open trough under the bed, is now being universally adopted.

References may be had, and their works seen at most of the Nobility and Gentlemen's seats in the country, nearly the whole of the London Nurseries, and a great variety of Horticultural Erections and Hot-water Apparatus, Models, Plans, Estimates, &c., at their Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square.

SHADES FOR GREENHOUSES.

J. WEEKS & Co., ARCHITECTS, Hothouse Builders, &c., Gloucester-place, Chelsea, beg to inform Horticulturists that they have made great improvements in their excellent and simple plan of Shading, whereby the largest or smallest can be instantly covered or uncovered with a sheet of canvas. To be seen in use at most of the London Nurseries, and at the Horticultural Manufactory, Gloucester-pla., Chelsea, near Sloane-sq

CHICORY.

THOMAS ABBEY, of Dunnington, near York, AGRICULTURAL IMPLEMENT MAKER, begs to call the attention of the growers of Chicory to his DRILLS for SOWING the SEED; and also to his CUTTERS, worked by hand or by horse-power, for cutting the roots into squares, preparatory to Grinding.

The Gardeners' Chronicle.

SATURDAY, MAY 25, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

TUESDAY,	June 4	Horticultural	3 P.M.
		Royal Botanic Gardens	2 P.M.
		Linnean	8 P.M.
WEDNESDAY,	June 5	Society of Arts	8 P.M.
FRIDAY,	June 7	Botanical	8 P.M.
SATURDAY,	June 8	Royal Botanic	4 P.M.

THE EXHIBITION OF PLANTS AND FRUIT last Saturday in the GARDEN OF THE HORTICULTURAL SOCIETY at Chiswick, proved that the skill of Gardeners is in general very visibly advanced since last year, and that the fondness of the public for such meetings is also much upon the increase.

A bitter North-east wind, and occasional squalls of rain, did not prevent 4367 persons from assembling on the occasion. On the 13th of May, 1837, when the day was equally cold, but quite dry, only 750 visitors were present; and on the 16th of May, 1840, the wind being south-west, a few showers prevented the attendance of more than 2471. In fact, the number last Saturday was within 500 of that in May last year, when the wind was westerly, and the afternoon perfectly fine.

A casual observer might not have perceived that advance in Gardening skill to which we have alluded, and might point to sundry very indifferent Pines, and some specimens but ill in bloom, as indicating the contrary. It should, however, be remembered that the plants for this Exhibition have been preserved through the very worst spring, for such purposes, that has been experienced for years. An unclouded sun, sudden heats followed by as sudden cold, and two months' dryness, would have ruined the plants of any except English gardeners. Their resources, however, proved equal to the demand upon them, and enabled them to produce an unrivalled display of beautiful cultivation, even though they had to bring their tender plants into a cold-bath—we had almost written an ice-bath.

What more particularly justifies our opinion that this Exhibition proved a general advance in Horticultural skill to have taken place since last year, was the total absence of bad cultivation. Whenever, on former occasions, such large masses of plants have been collected together, a considerable number of very poor specimens has been found among them. This year we did not observe one. The single specimens, for example, were nicely grown and cleverly managed, and coming in many instances from those who have not the opportunity of producing anything else, clearly showed that the great gardeners of the day would soon find worthy rivals if opportunity occurred. It would be invidious to mention names; but those who examined the plants will readily admit that this our good opinion was deserved by many men as yet unknown to garden-fame.

There was a fine display of fruit, with the exception of Pine Apples; and some highly interesting new things, especially a snow-white Cactus, of wonderful beauty, called Crenatus, invaluable for hybridising, and a Rondeletia-like plant with flowers of a rich ultra-marine blue, which has been named Hindsia violacea. It was also gratifying to see how well and neatly several of the collections were ticketed with their names—a great improvement in such exhibitions, which often lose half their interest from the impossibility of ascertaining what the plants are whose beauty excites attention. We add too, with much satisfaction, that the gardeners who attended were much improved in their personal appearance. We saw none of that dirty slovenly class which we have been formerly obliged to proclaim a nuisance at such meetings, and a disgrace to their brethren. On the contrary, all were dressed respectably, according to their means. There was but one unshaven man amongst them, and to him a pass-ticket was refused. Unthinking people may suppose such matters as dress of very little importance, and may fancy that it does not signify whether a man shaves himself and wears a clean coat on holidays or not, provided he grows his plants well. No stronger instance of false judgment could be given. Gardeners are ambitious of elevating themselves in the eyes of the world, and we are at all times most ready to give them effectual assistance in doing so; but the first step that any man must take who would rise above the crowd is to be neat and clean in his person. It is not enough to *be* respectable—it is necessary to *appear* so. The world cannot examine people's conduct or skill with much exactness, and is therefore of necessity guided greatly by appearances. Besides this, a gardener is brought much in contact with gentlewomen, and nothing is more unpleasant to a lady than to have constant occasion to consult a dirty servant, or to be jostled in a crowd at a flower-show by filthy ill-dressed people, whose faces are as unconscious of a razor as their linen of soap and water. To say that such people have contributed the beautiful objects that are brought together would be a libel upon all respectable gardeners, in the shape of an apology for those who are the contrary; and there are few persons who would not rather be without the flowers, if they have to purchase their pleasure by contact with such disagreeable neighbours.

But there is another reason why all gardeners should be careful to preserve a respectable, neat personal appearance. Dirty gardeners are bad gardeners; that may be taken as a rule to which there are no exceptions. They may do for labourers, but are unfit for anything more. The reason of this is plain. Neatness is indispensable in gardening; in the absence of it weeds run riot, insects swarm, and the trim beauty of a flower-garden is exchanged for the shabbiness of a wilderness. He who is slovenly in his personal habits will be so with the plants he cultivates; while, on the other hand, habitual neatness in one thing renders unneatness in other things too disagreeable to be possible. There is no doubt that much of the difference which exists among gardeners as to skill depends more upon little than what are commonly called great things. An exact attention to minute matters, and great care in details, the practice of which is among the most essential, though often most neglected parts of a gardener's education, will insure to the man of moderate abilities a superiority over him who, whatever is his cleverness, neglects them.

It was therefore, we repeat it, a source of the most sincere gratification to us to witness the highly respectable appearance of the gardeners collected at Chiswick last Saturday.

WE once more return to the subject of LANDSCAPE GARDENING.

Besides the power of vision, properly so called, and which makes us aware of the presence of objects, there exists a peculiar faculty which takes cognisance of colour. We have known persons, who, not possessing this faculty in a sufficient degree, mistook one colour for another, and could not distinguish them. Some persons, again, have so strong a passion for colour as to delight in its contemplation, without any regard to harmony or fitness. The Dutch are examples of this. The Landscape Gardener must possess this faculty in a proper degree; he must have not only a quick perception of mere colour, but of harmonious arrangement, and the effects of shade, and of one colour upon another. The vegetable world presents every variety of colour; but the Landscape Gardener has to do with but a small number, and chiefly with varieties of green, and the varying hues of spring and autumn. Nor is this all; he must be acquainted with the season at which each tree or shrub puts forth and sheds its leaves. This requires not a little study. Then comes the selection of shades of foliage, and styles of growth adapted to various situations and special scenery. Nature tells us not only in what situations certain trees will live and grow, but she suits these to the situation with unerring hand. She has genera and species for every climate, so that few positions suited to the dwelling of man are without something that is gratifying to the eye, and where there is deficiency it is in his power to supply it. Man was not created to be idle, and every inducement has been held out to him for exercising the powers with which he has been endowed. The wildest wastes of our island are capable of improvement, and the only obstacle to its being effected is to be found in the want of means, created by the artificial state of society, leading the rich to squander their wealth on what may produce momentary gratification, but which ends in ruin. Wealth is necessary to reclothe the surface; but, alas! where wealth should most abound, there does poverty extend the farthest. Were riches expended on the improvement and embellishment of the land, instead of being scattered abroad, as they too frequently are, on useless and unsatisfactory luxury and gambling, poverty might disappear, and competency be enjoyed by all.

The variety of green tints is very great, and their disposition of importance. Green is a mixture of blue and yellow, and the predominance of either must be studied. A different suit of colours appears in the autumn, the yellow prevailing, but mixed with red, instead of blue, which seems to disappear from the tints of autumn. Some trees change colour early, as the Horse Chesnut; others late, as the Beech and Oak. Advantage should be taken of this, and trees arranged accordingly. Evergreens should generally be so disposed as to form a mass when other trees are naked; but in some situations, single Pines and Firs, if room be given to them, produce a fine effect.

When a house is to be built where trees already abound, difficulties will occur in choosing a site. It is dangerous to cut down trees before the building has been erected; and yet effects may not be brought out, so as to assist in the choice without thinning. It is also difficult to conduct roads where trees stand thickly; in such a case the landscape gardener should proceed with great caution, removing first such trees as are not in themselves worthy of a place.

The disposition of water, where sheets of it are to be interspersed with trees and shrubs, has fine effect in certain situations, when managed with judgment. But we cannot teach judgment, any more than taste, both being gifts of Nature.

Of all things connected with Landscape Gardening, buildings are often most offensive; and we find the grossest defects of taste frequently displayed, both in their style and position. Many persons are apt to associate external Nature with the state of society in times long past. This is an error that has led to many trespasses against Nature's rules. A man will build a castle, because the situation he fixes for it is a commanding one, and would have answered all the purposes of defence in a rude state of society. His taste leads him into expense, and to the sacrifice of convenience and comfort. The adoption of former styles shows taste in some instances; but we rather think it an indication of want of invention. The country is covered with new residences in the Elizabethan style, and there is a sameness that is rather tiresome, and far from being so picturesque as the castellated with all its modern incongruities. Dwelling-houses should be arranged for comfort; and where means are at command, also for elegance and grandeur, both internally and externally. The ruins of ancient buildings produce a most pleasing effect; and they ought to be preserved, but it would be preposterous, in our day, to build that which is felt to be impressive only when in a state of ruin. This is a subject not altogether separated from Landscape Gardening. When a professor finds buildings in his way, it is his business either to hide them, or to exhibit them to the best advantage.

We have now touched, though lightly, on most of the subjects connected with Landscape Gardening. On such a subject it is scarcely possible to strike out anything new; and our *Chronicle* is the site of business, and not the field over which Imagination can be permitted to spread her wings. We now, therefore, for a time at least, take leave of the subject, and of the reader; repeating that a man must be born a Landscape Gardener; *pocta*, for he is a poet, *nascitur, non fit.—G.*

ON THE MANAGEMENT OF PEACH-TREES.

IN answer to "Omikron" (see p.) I am of opinion that the chief cause of the lamentable state of his Peach-trees is to be sought for in the soil, together with the attacks of insects. I have had a very close acquaintance with the Peach-tree, and I am familiar with its habits, both in northern counties and around the metropolis; and the result of my observations has produced in me a decided impression that at least nine-tenths of what is called disease in the Peach, is clearly traceable to deep and stagnant soils, to deep digging over the roots, to over manuring, and to insects and ill-ripened wood. The chambering system, as it was called by Mr. Mearns, together with the mode of forcing employed by Dutch gardeners, of removing their trees every year, or in other words the root-pruning system, tends to illustrate the point I would wish to press.

I will now examine the matter, and afterwards relate what I consider to be principles essential, nay indispensable in the cultivation of the Peach. "Omikron" says, that one consequence of the disease is the attack of aphides. Is he well assured that they do not rather partake of the character of adjuncts to the original cause, instead of being merely an effect? The next point to which I would advert is "Omikron's" plan of placing what he terms virgin loam, and in another place mould, on a bottom of cement. Now, I should have no objection to place chopped turf, fresh from the pastures, on a bottom of cement, but placing an under-spit of friable soil in immediate contact with the cement is quite another thing. In the latter case, stagnation would ensue betimes, nor would the "sloping outwards" by any means perfectly obviate it.

"Omikron" proposes to make experiments with different sorts of "mould." But it is now high time that the grand difference between mere mould and chopped turf were well understood, although Mr. Barnes advises that turf be taken from the road-side, or the margin of a common. I do not mean to assert that what is called "mould," will not grow the Peach. I merely insist on the preference for the chopped turf, where steady durability is the object. As to the presumed change taking place in a tree removed from a shady quarter of a nursery, to a south wall, I am not disposed to doubt it. But what change? From bad to worse? By no means—the change is altogether for the better. Surely, a Peach in

a pot, removed from a damp and cool greenhouse into a Pine stove, could not, by any means, be expected to produce gum and mortification.

The principles I consider of the most essential importance in the cultivation of the Peach, are as follows:—

1st. Shallow borders of chopped turf.
2nd. Planting on mounds of brick.
3rd. Total absence of insects.
4th. Constant stopping during the growing season, all young wood which is disposed to burst into buds laterally.
5th. Liberal, but progressive disbudding of the young wood.
6th. Reasonable cropping.
7th. Top-dressing when necessary.
8th. No young wood reserved at the final disbudding, but what is necessary for the next year.
9th. Early nailing of the young wood.
10th. All young and growing shoots, except the weak and inferior portions of the tree, stopped the moment the fruit begins to change for ripening.

Now, 1st, by shallow borders, I mean from a foot to eighteen inches, although I plant on the mounds, and with great success, for I have neither insect, curled leaf, or gum, and a fine crop of fruit. But be it understood, that the chopped turf, which the trees in the garden under my care are growing in, is the furrowings from old clay pastures—a good and adhesive loam; and this the Peach likes, if mellow. I will pass by the 2nd point, as I have, as it were, included that in my first.

3rd. *Total Absence of Insects.*—I have known in my time a wall of fine trees irrecoverably ruined by aphides in about the space of one week, or little more. Now, aphides in this case were certainly not, as "Omikron" states his to have been, a mere consequence of previous disease; for the trees were in all respects most assuredly in perfect health. However, the cure is simple and cheap. As soon as you perceive aphides, which will be about the period of the "setting" Peach showing itself through the blossom, syringe the trees two days successively with tobacco-water. This has never failed with me to keep off aphides for the whole summer. However, we have another enemy to contend with. The red spider will generally, in a period of drought, commence an attack. For this some recommend sulphur, some cold water. I am quite assured, from experience, that, however natural it may seem to see a tree deluged with the engine some sunny afternoon in May, when perhaps the thermometer at midnight may indicate 28°, it is by no means congenial to the Peach. That the Peach will do well without this ablution, through the early part of spring, I am well assured; for the whole of my Peaches out of doors have this season not received one drop of water, and it has not rained here since about the end of March, and the dews have been rather light.

My plan with regard to the red spider, is to apply with a paint-brush a line of sulphur between every two main shoots on the wall, drawing also a broad band of the same at the bottom of the wall. The sulphur is mixed with a little skimmed milk, and made into a thick paint, by mixing it with thick clay water, and a little soft-soap, to make it adhere. I have tried this scheme for three years, and seldom or never can a red spider be seen in the trees here. Every time the sun shines, the smell of the fumes may be perceived even across the walk in front. About three shillings' worth of sulphur, and a man's labour for four hours, insures in this respect perfect freedom from this pest, and, as far as I have seen, entirely supersedes the necessity of so many cold syringings, which, to say the least of them, are great robbers of the solar heat absorbed by the wall, and which is of great use to counteract the sudden depression of temperature so frequent at night through the month of May.

4th. *Constant Stopping the Young Wood*, or in fact promoting the equalisation of the sap during the growing season.—All that the knife can do in winter pruning is as nothing compared to what may be effected in this way during the period of growth. Strange that so much should be said about systems of pruning, and so little attention paid to summer stopping! Robbers are suffered to take the lead, to the prejudice of the true bearing wood, and after decoying the sap from the profitable wood, and exciting a superfluous action of root, are cut out at the winter's pruning, leaving a preponderating power in the root, leading to a necessity for root-pruning, and causing nakedness in the lower parts of the tree.

5th. *Liberal but progressive Disbudding of the Young Wood.*—By liberal I mean that at the final thinning, about the end of May, no more wood shall be left in the tree than is wanted for the next year; and by progressive I mean that the only true maxim is to thin little and often. Nature does not like to be taken by surprise; and by doing this with a light hand, she is able in the interval to restore the reciprocal and necessary balance between the root and branches. I make no doubt that gum is often excited, certainly increased, by a wholesale robbery of this description, soon after the tree has budded.

6th. *Reasonable Cropping.*—Over-cropping exhausts the energies of the Peach, shortens its life, and renders the fruit inferior in size, and more especially in flavour. As an average rule for a tree in good health, I should recommend the fruit to be at least six inches apart at the final thinning.

7th. *Top-dressing when necessary.*—It is evident that with shallow borders, there will arise a necessity for top-dressing in hot and dry weather. In the early part of summer, those trees which require watering should have four inches of good rotten manure spread over their roots, and a liberal watering once, or it may be a second time; over this mulch will set all to rights. Let no young wood be reserved at the final disbudding, but what is wanted for the next year.

8th. Has been treated on under section 5.

9th. All young wood should be nailed close the instant it is long enough; no pains should be spared to get the wood well ripened, for on this everything in the next year depends.

10th. All young and growing shoots, except the weak ones, and those on the lower portions of the tree, should be stopped the moment the fruit begins to change for ripening. By this time the true bearing wood of the next year will be well formed. All after this, I regard as superfluous, and tending to keep up a late action of the root, which will be of no service to trees in health, or of sufficient vigour. Stopping also tends to concentrate the energies of the tree, at the very time that concentration is most required; for at this period all that is wanted is abundant elaboration, preparatory to the ripening of the wood, and the flavouring of the fruit. However, at this juncture all the lower and weaker parts of the tree should be excepted. This is the commencement of their harvest; and this, with the stopping of the luxuriant wood through the summer, will tend more to equalise the sap, than all the systems of pruning, which have ever possessed undue importance.

Our kitchen-gardens are all, in my opinion, laid out on wrong principles. Had I the laying of one out entirely according to my own judgment, I should reject the idea of growing vegetables altogether on fruit borders. I would, however, have narrower borders—say six feet wide, which is plenty for any tree, if good chopped turfy loam is used. On the border, across the walk, I would establish table trellises, and very dwarf espaliers; and next to that, at the head of the quarters, a ten-feet wide slope, backed up with turf for all the early crops. There would then be no pining about the loss of the wall-border.

In conclusion, I would assure "Omikron," from experience, that if these directions are attended to, success is the certain result, and he need be under no apprehensions about mildew, aphides, red spider, or any other disease.—*Robert Errington, Oulton Park.* [We have a letter on this subject from "Omikron," for which we hope to find room next week.]

ROSE-GARDEN.—No. IX.

(*Continued from page* 317.)

Preparing the Bud for use.—Take the shoot in the left hand, holding the thick end inwards; enter the knife three-fourths of an inch above the bud, and bring it out the same distance below, cutting half through the wood, so that the shield (or portion of bark containing the bud) comes off in the shape of the segment of a circle: this is when the buds are scarce, and it is desirable to procure as many as possible from the same shoot; if the latter be of no consequence, a full inch may be given to the top of the shield. In using buds, only such part of the shoot should be cut off as contains buds enough for the stock under operation: if a shoot be kept long out of water, and the weather be hot, the last buds upon it will sometimes slip with difficulty, and are consequently not be depended upon.

D the knife to bud with, the blades of which must be very thin, three-eighths of an inch wide, and about two inches long; the handle three inches, and the ivory point to turn back the bark with, two inches long, and thin at the end. Take the bud between the finger and thumb of the left hand, holding the point of the bud downwards, press the bud gently to keep it in its place, twist the upper end of the shield, which ought to be nearest you, gently backwards and forwards, and the wood will come loose from the shield. Take out the wood with the right hand, and see that no vacuum be left in the inside of the bud; if there be the root is gone, and it is impossible it should succeed (although the bark uniting might appear to give hopes of it); if not, the shield is fit for use, provided the bud has not been nipped too hard, or displaced by the shield having been incautiously bent; in either of which cases, time must show the defect by the failure of the bud. Or,—Mark out in the shoot by cutting round the shield, and peeling off the rest of the outside bark, the bud desired for insertion;

press the bud gently against the wood, with the finger

and thumb of the left hand, and, twisting the wood from side to side, the shoot being in full *sève*, the shield will detach freely. Or,—Marking out the bud, as above directed, place a hair or piece of silk behind it, between the bark and wood, and taking care that the silk, as it were, scrapes the wood that lies behind it, in its progress between the bud and the shoot, pull the two ends of the silk, and the bud will remain uninjured, and the shield fall off safe and sound. If there be the least difficulty in detaching the shield, from its adherence to the wood, the shoot is not in order, and the buds upon it must be rejected, though some might, by a possibility, succeed. In the first of these cases, the separation of the little segment of wood which comes off with the shield, should commence at the end of the shield nearest its summit, which mode, from the slanting position of the bud, hooked, as it were, into its case, will be found less likely to displace the eye, than beginning at the other end; the edges of the bark of the shield should be smooth and clean, particularly where, as subsequently directed, it is cut off to meet the bark of the stock into which it is inserted. If the shoots have been brought from a distance, and the leaves have not been cut off, as above directed, on removal of the shoots from the parent tree, the shield will not slip so easily, and the eye of the bud will be in great danger of injury.

ON THE CULTIVATION OF TEA IN KEMAON AND OTHER PARTS OF THE HIMALAYAN MOUNTAINS.

AT an evening meeting of the Royal Asiatic Society, held on the 24th ult., the Earl of Auckland in the chair, a lecture was given by Professor Royle, On the Successful Cultivation of Tea in the Himalayan Mountains. In commencing, Dr. R. remarked, that in order to cultivate any plant successfully in a new situation, careful attention required to be paid to the influence of physical agents, especially if it was desirable that the plant should retain all the properties which render it useful in the arts—in medicine, or as an article of diet or of luxury. To find a suitable situation, it is necessary to observe not only the chemical, but also the mechanical nature of the soil, and the due supply of water, &c. Also the climate, including the course of the seasons, the temperature of summer, and that of winter; the differences of dryness and moisture, with the effects of light, of winds, &c.; and to notice the plants which are associated together. It is hardly ever possible to get minute and accurate information on these points, and least of all in the case of the Chinese Tea-plant, as no competent observer is known to have visited the districts where it is more especially cultivated. From the difficulty of obtaining precise information on all the requisite points, the method adopted for ascertaining, what was required for the successful cultivation of the Tea-plant elsewhere, was to draw inferences, from the extent of its geographical distribution in China, the general nature of the soil, the peculiarities of the climate, with such notices of the vegetation as we were able to obtain from the progress of the British embassies. We know that an inferior Tea is produced near Canton, a good-flavoured Tea in the Ankoy Hills, but most of the Tea of commerce in the Black and Green Tea districts. It also appeared that Tea is cultivated in China from 17° to 36° of N. latitude, but the black Teas of commerce from 27° to 28°, and the green Teas from 29° to 31° of N. latitude chiefly. The soil, from all accounts, appeared to be poor rather than rich. The climate of China being one of great extremes, the Tea-plant must necessarily be subjected to considerable heat in summer, as well as to great cold in winter. There is no regular rainy season, but there would appear to be some moisture of the soil and climate in many of the situations where Tea is cultivated.

Dr. Royle then called attention, on maps sent by Mr. Arrowsmith and by Mr. Walker, to the relative positions of China and India, and especially of the Tea districts and the Himalayan Mountains. These extend from Cashmere to Bootan. From thence a branch stretches east across China to the province of Fokien, &c. The range thus extends over 45° of longitude, but does not make more than 10° of northing. As in ascending from the forest-clad bases of the Himalaya, to their summits covered with eternal snows, we meet with almost every variety of climate that is encountered in proceeding from

the equator to the poles, so there would appear to be no difficulty in finding congenial climates for the Tea-plant, especially as in these mountains are found genera such as Camellia, Eurya and Cleyera, allied to the Teas, as well as other Chinese genera, such as Deutzia, Houttuynia, Stauntonia, Kadsura, Hovenia, &c.

On such grounds Dr. Royle in the year 1827, and again in 1831, when Superintendent of the E. I. Company's Botanic Garden at Saharunpore, recommended to the India Government the cultivation of the Tea-plant in these mountains, in the districts under British influence; that is, in Kemaon, Gurhwal, and Sirmore. In 1832 Dr. Wallich presented a paper to the President of the Board of Control, advocating the cultivation of Tea in the same districts. In 1834 Dr. Royle published an Essay on the cultivation of Tea in the Himalayas, in his "Illustrations of Himalayan Botany," and stated that as in these mountains there existed so great an analogy in latitude, elevation, soil, climate, and the courses of the seasons, there could be no doubt of success in introducing its cultivation, with the strongest probability of all its properties remaining unchanged, as every requisite is so similar to what it experiences in its native country, and labour is cheaper than even in China.

In 1834 the India Government, with the sanction of the Court of Directors, determined upon attempting the cultivation of Tea in the British dominions in India. A committee was formed, and reports called for. Dr. Falconer, in reply, recommended the same tract of country as Dr. Royle had done, in a report which is remarkable for coincidence in argument and opinion, with that at the same time published by Dr. Royle, though the two must have crossed each other in their passage to and from India. Mr. Gordon was sent with Mr. Gutzlaff to obtain seeds, and as much information as possible from the Tea districts of China, together with some Tea manufacturers. They visited the Ankoy Tea Hills, obtained a considerable quantity of seeds, and made an unsuccessful attempt to reach the Bohea Tea Hills, when they were recalled in consequence of the discovery of the Tea-plant of Assam.

Dr. Royle then called attention to the specimens of the green and black Teas, and the Assam plants from Mr. Loddiges, to the two former from Sir Wm. Hooker and from Sir G. Staunton, to dried specimens obtained by Mr. Ball from the black Tea districts, and to the Tea-plant of Chusan sent to the India House by Dr. Cantor, but did not give a distinct opinion whether he considered the Chinese plants as distinct species or only varieties of the same, or whether the Assam plant were a distinct species, or a variety, but recommended, as he had done in 1840, that the whole should be subjected to experiments in the Tea districts of Assam and the Himalayas, in different soils and climates.

The seeds obtained by Mr. Gordon having been sent to Calcutta, and sown in the Botanic Garden, numbers vegetated, though many failed. Nurseries having been established both in Assam and in Kemaon and Sirmore, at elevations of from 2000 to 7500 feet, seedlings were sent, but of 12,000 sent to Assam, only 500 arrived alive; and of 10,000 sent to N. W. India, only 1326 reached the hills in the beginning of the year 1836. In December, 1838, Dr. Falconer wrote to Dr. R. that the Tea-plant was thriving vigorously in two, and had flowered in three of the above nurseries. On the 21st April, 1841, Dr. Falconer reported that from the 500 plants originally introduced into the Kemaon nurseries, 5000 had been produced from layers, and from the seeds ripened. Many of them had grown to the size of bushy shrubs, about five feet high.

In the year 1842, nine Chinese Tea-manufacturers, who had been in Assam, were sent to the Tea-nurseries of Kemaon and Gurhwal. On arrival, they united in declaring that the Tea-plants of the Kemaon plantations were the genuine cultivated Chinese plant, and far superior to that grown in Assam, but that they required cutting down before they would be in the best state for yielding good Tea-leaves. On the 12th Oct., Dr. Jameson, who succeeded to the charge on Dr. Falconer having been obliged to leave from ill health, wrote, "The Tea-plantations in the Deyrah Doon and in Kemaon are thriving admirably."

In the early part of 1843, some Tea was prepared from the above plants by the Chinamen. On 20th Jan., a portion was sent to Calcutta, and a small canister to Dr. Royle, at the India House. The former was reported on, on the 11th of May, by members of the Chamber of Commerce, and stated to be a very good marketable article, and valued in London at about 2*s.* 6*d.* per lb.; and the specimen sent to London was, on the 23d May, 1843, reported on by Messrs. Thompson, and pronounced to be of the Oolong Souchong kind, fine-flavoured and strong, equal to the superior black Teas generally sent as presents, and better, for the most part, than the China Teas imported for mercantile purposes.

On the 17th April, Dr. Jameson wrote from Almora, that all the Tea-nurseries were looking admirably; and the Chinamen were busy manufacturing black (Pouchong) Tea, which appears to be of a much superior quality to that already made. On the 30th of August, 1843, a sample, consisting of 16 small canisters of black (Pouchong) Tea was forwarded by the overland route for the inspection of the Court of Directors, covered with wax-cloth, which unfortunately gave a little of its flavour to the Tea, as the canisters got injured, and did not arrive before Dec. 1843. This was reported on by Messrs. Thompson, who observe that the samples are all more or less affected by the wax-cloth. One kind was called a fine Tea of the Oolong class, with a leaf somewhat like that of fine black-leaf Pekoe, value from 2*s.* 6*d.* to 3*s.*; another kind, as a longish, even, rich, blackish leaf, of the usual size of, and like, China Oolong, value 2*s.* 6*d.* to 2*s.* 9*d.*; a third, as a fine Tea, but not esteemed in this market, on account of the paleness of the leaf. Mr. Andrews Hunt, late Inspector of Tea to the East India Company, describes the Tea as well made, smallish, blackish, wiry Tetsong kind of leaf, the smell like that of China Tea, rather burnt, the colour of the infusion very good, and the taste fragrant and true, as Tetsong Tea; value, from 2*s.* 3*d.* to 2*s.* 6*d.*, 2*s.* 9*d.*, and 3*s.* per lb. The flavour, and other characteristics of the leaf of the Tea-shrub of Kemaon were pronounced identical with the Chinese plant grown in Ankoy, a district which, in Chinese estimation, produces highly-prized Tea. "The appearance and flavour of the best of the four samples are unexceptionable; and, while the former does great credit to the Chinese manufacturing operations, the latter fully justifies their opinion, that the Tea-shrub in the Kemaon plantations is the genuine Chinese plant."

Dr. Falconer having brought a specimen of Tea from Kemaon, submitted it to Messrs. Ewart, Maccaughey and Co., of Copthall-court, who report, 8th Sept., 1843, that it resembles most nearly the description occasionally imported from China under the name of Oolong; it is not so high-flavoured as the fine Oolong Tea; it has been too highly burnt in the preparation, but it is of a delicate, fine flavour, and would command a ready sale here. Dr. Royle, after remarking, that nothing could be more satisfactory than these reports by experienced Tea-brokers, as the first attempts to make Tea in the Himalayan nurseries, called attention to the curious fact, that all the brokers coincided in comparing this Tea with the Oolong and Tetsong Teas of China, which, he was informed by Mr. Ball, were obtained from the Ankoy Tea-district, that is, the very locality where Mr. Gordon obtained the Tea-seeds.

The latest letters from Dr. Jameson continue to give the most favourable accounts of the Tea-nurseries, while others from Captain Cautley speak in the same style of the Tea-nurseries in the Deyrah Doon, where, he says, the plants are looking splendidly, and are growing vigorously. Dr. Jameson states, that though he will be able to send only a few hundred pounds of Teas this year, several thousand pounds will be sent next season. There are about 100,000 plants in all the above nurseries, and they may be rapidly increased. The Court of Directors have ordered that the experiment be continued, and that one-half the produce be sent to this country, in order that its quality may be clearly ascertained and extensively made known.

Dr. Royle concluded his address by recapitulating the heads under which he had given an account of this important experiment instituted by the Court of Directors and the Indian Government, and stated, that as the practical results had in every point been exactly such as had been anticipated from the scientific data procurable before the experiment had been instituted, he felt no hesitation in repeating what he had stated in 1840 in his "Essay on the Productive Resources of India," that he confidently looked forward, not only to having Tea cultivated all along these mountains, but also to its being finer flavoured than the Assam. He now thought that the culture of Tea might be introduced into the villages, and even round the margins of the terraced cultivation of the Himalayas, and that Tea might be manufactured extensively, cheaply, and of excellent quality; though at first, probably, most profitably in the elevated valleys at the foot of the Himalayan mountains.

Dr. Falconer, who was present, then addressed the meeting, and gave his reasons for the opinions he had entertained respecting the fitness of the Himalayas for the cultivation of the Tea-plant. He also called attention to the differences apparent between the Assam plant and that of China, and which it retained in the Northern nurseries as well as here. He then showed how well calculated for Tea-cultivation were the N.W. nurseries, especially in the Deyrah Doon. This valley is particularly eligible for an extensive culture, as there is abundance of cleared land, moderate in rent, with abundance of cheap labour in the vicinity, great facilities for irrigation, easy access to the Ganges and Jumna rivers, by which the produce might be cheaply conveyed to Calcutta, and even by the Indus to Bombay.

BEES.

At p. 53, 1843, is a front view and ground plan, if I may so term it, of the hive I have adopted for my bees. The principle is in every respect the same as is described under the head "Management of Bees," signed C. A. A. Lloyd, p. 118, 1844, with the exception that I do not use zinc ventilators in any shape, as I imagine that that metal is as pernicious to bees as it has been found to be to the human race when milk has been partaken out of zinc dishes.

At p. 101, 1843, I made some observations on bees, and expressed my belief that I had succeeded in making a hive which would insure the health of that interesting insect; as, from the previous autumn to the 13th Feb., 1843, I had witnessed very few dead bees in or near my hive—only about 20, and that it remained perfectly clean and sweet throughout the winter. I have now to add, that I am perfectly satisfied in every respect with my hive up to the present period; as not half the above number died from the autumn of 1843 to the 1st of Feb. 1844, which day being very mild, my bees were flying about as numerous as if it had been a day in May, and carried out all the fragments of wax from the bottom of the hive, as well as their dead, of which I only observed 8 altogether during the past winter and up to the above date. The bottom-board remained remarkably clean, and the hive kept sweet throughout the whole of their second season of repose,—a sure criterion that the inmates enjoyed excellent health, as cleanliness is essential to the preservation of these insects. I have therefore every reason to be satisfied with my success in insuring the health of my bees during the winter season; but I cannot congratulate myself as yet on having derived any profit from them, although I am fully convinced three as fine swarms as could be wished were reared in my hive last summer, but proved ungrateful, and I have no doubt took possession of tenantless hives belonging to other bee-keepers, whose stocks must have suffered severely owing to the long-continued rainy weather which occurred in May and June, 1843. I entirely attribute the loss of my swarms last summer to giving them too much accommodation, which enabled them to make the necessary arrangements for their departure without my having any control over them; the whole of their plans having been communicated to each other in the side-box, as on no occasion did they hang in clusters at the mouth of the centre hive; and when they left the side-box on each of the three occasions, they went off in one continued stream, but not in the usual way as I have seen bees swarm when they previously clustered at the mouth of the hives. I do not, however, regret the loss of my swarms, as other parties must have been benefited by them; and the plan of my hive has enabled me to observe some peculiarities connected with these wonderful insects, which appear to me to have escaped the observation of all the naturalists who have written on their history or management; and in order to convey to your readers the result of my experiments, so far as they have yet been made, I shall continue the history of my hive (I have only one for the purpose of making experiments), from my communica- to the *Gardeners' Chronicle*, in February, 1843, to the present period. In February, 1843, I stated that, in consequence of a lady having remarked that her bees kept in boxes generally died during the winter, I lined mine with India matting, and the bees appeared to approve highly of the alteration by running over it. When the weather became very warm in April, I opened the outer entrance to the side-box, which is of the same dimensions as the entrance to the centre hive, and the bees went out and in at both places with evident satisfaction that they had such facilities of ingress and egress; as, if interrupted at one entrance by the numbers going out and in, they at once availed themselves of the other. About the latter end of April three of the bees, apparently to me having an officious kind of character, from the manner in which I observed other bees act towards them, commenced running round the entrance to the side-box, endeavouring to run up and down the wood of which the box is made, in the same way as other bees often do on straw hives before swarming; but the wood being painted and smooth, their little claws would not hold, and they fell down as often as they made the attempt, and appeared in a violent passion. With the view of humouring them, I fixed a piece of the India matting over the whole breadth of the front of the side-box, and about four inches deep, and it was really amusing to witness the numbers taken out to examine this addition, and the satisfaction it gave to all. On the same evening about 200 bees clustered in the side-box for the first time, and remained during the night. On the following night there were about 500, and on the third night, the weather being very warm, upwards of two thousand. The fourth day the weather changed to be very cold and rainy, and the whole of the bees left the side-box and went into the centre hive. The cold weather lasted three days, and during that period the bees all remained in the centre hive. The weather having again become warm and genial, a small cluster was formed in the side-box, as on the first occasion, and the number of bees in the centre hive daily increasing, the side-box, from the 4th of May, was permanently occupied until the end of the season. During the long period of rainy weather in May and June, 1843, especially if attended with cold winds, the number of bees in the side-box varied considerably, and indeed they might have been referred to as an excellent barometer. About the end of June or beginning of July, the side-box became so full that a space of only about two inches across remained unoccupied, and from the way in which this vacancy was arranged, at various times during the day, and numerous bees being employed fanning at the entrance and in the interior, it was evidently left for ventilation. At this period the movements of the bees at the entrance of the centre hive, and the same at the side-box, and the great number of drones going out and in at the side-box, induced me to set a watch upon them during the day; but, although there could not have been less than from 10,000 to 15,000 bees in the side-box in the morning of one of the fine days, at the commencement of July they nearly all left and never returned, and in the afternoon and during the night there were not above 200 in the side-box. The numbers, however, daily increased a second time, until 12 days after the first swarm had left, when the second followed in a similar manner, leaving very few, as on the first occasion. The numbers increased a third time, and, singularly enough, on the twelfth day from the departure of the second swarm, the third left in the same manner, leaving only about 200 in the side-box. On the day after the departure of the third swarm, the numbers again began to increase in the side-box, and I suppose being then aware that no more swarms would take place during the season, they immediately commenced forming combs in the side-box, and there are now three beautiful combs in it of the size of breakfast plates. These combs during the month of August were

filled with most beautiful honey as clear as crystal; but by the end of September the whole of the honey was taken out of them and deposited in the centre hive, and the whole of the bees retired to their winter quarters, leaving the combs for use during the present season. I then closed up the outer entrance to the side-box, and it has remained shut during the winter. The combs appear to be in very fine condition for being re-filled with honey.

Bees have hitherto borne the character of being industrious, and the indolent of the human race have often been urged to follow the example of the "busy bee," and I have no wish to detract from the very meritorious and untiring labours of these interesting insects during the time allotted for their daily labour, which I firmly believe does not exceed six hours, even in the very finest uninterrupted sunshine or pleasant weather, in every way suitable for their tasks. I have come to this conclusion from repeated observation, that in proportion to the number leaving the centre hive or side box, at the early hour of five o'clock in the morning, nearly an equal number came in to the side box to repose at 11 o'clock a. m., and those that left at later hours in the morning, ceased from their field labours at intervals of about six hours during the day. Those that had returned from labour could easily be distinguished from the others that had not been out, as the former occupied particular positions until those that were asleep awakened, and vacated their places to go on duty, and then the other might be seen taking up their positions, and in a short time afterwards were fast asleep. It is worthy of notice, that although bees only work in the fields six hours a day under the most favourable circumstances, they all take their turn of duty, both by night and by day, to protect the hives, and the sentries at the entrance are relieved with as great regularity as in military life. There are also several that never work themselves, but appear to take regular rounds to ascertain that the others are faithfully performing their duties, and the whole government and system of a hive is the most perfect that can be imagined, and were the traits of character in these insects, which I imagine I have perceived, recorded, they would be rejected as incredible; however, they have afforded me great amusement, and I am satisfied with the result of my observations.

I am now fully convinced that the clustering of bees outside the entrance of hives, is no loss whatever to bee-keepers, as has been supposed, the clustering being a natural state of repose, which they cannot enjoy within the hive, in consequence of the state of the weather at the time making the temperature of the interior too warm for them. On this account I am decidedly against adopting any means to assist them in ventilating their hives from the top or sides, as they can regulate the temperature with the greatest nicety, and if they should on any particular occasion suffer from too great heat, it is better they should do so than interfere with their arrangements, as they soon show their displeasure with plans of which they do not approve, by closing up with propolis all ventilators except those at the bottom or entrance of the hive. In closing the details of these European Humming birds, as I may term them, owing to many of their habits, I would observe, that I have never narrowed the mouth of my hive during the two last winters, and during the same period I left the interior communication with the side-box open to its fullest extent. I have never fed them in any shape whatever, as they have ample stores of honey in the centre hive, which is made of straw twelve inches deep and fourteen inches diameter inside. The side boxes are eight inches square inside, and ten inches deep. As a proof of the number, health, and strength of my bees, I may mention that during several of the mild days in the early part of February, of the present year, the perspiration from them was running out at the entrance, in the same manner as it appeared to do in May, last year. They have now commenced their spring campaign, and during several days of the present month of March, hundreds have come home from the fields, well loaded with pollen, and I have not observed one perish of the cold, which is often the case at this season of the year. I had not an opportunity of trying to make artificial swarms last year, as my bees did not form combs in the side box, which I consider essential for success, until after the season of swarming was past.—*John Grant, Editor of the Army and Navy Register; Woolwich, March*, 1844.

Home Correspondence.

Spot on the Pelargonium.—Having taken much pleasure in the culture of the Pelargonium for some years, and having suffered a little from the appearance of a spot upon the leaves during the last two years, I have been most anxious to discover the cause of this disease. Last autumn, when I cut the plants down, I removed every leaf, placed them in a cold frame, where they broke well, with no appearance of the disease; they were then repotted in loam, leaf-mould, and sand, and placed in the greenhouse on a stage 3 feet from the glass. The winter being mild, little fire was needed. In March they were repotted, the large plants in 12s, in loam, leaf-mould, cow-dung three years' old, and a little sand. Having a small house where nothing else is grown, they had abundance of air given them on all occasions; and to guard against boisterous winds, I nailed a piece of cheese-cloth, a yard wide, over the top of the house, which I find most useful, not only in checking the wind, but also in keeping out dust, smut, and in the summer, bees. They were very strong plants, and showed a fine head of bloom. The spring being very warm, and our Show not taking place until the 11th of June, I kept them as cool as possible, drawing an awning of cheese-cloth over the house from 10 o'clock until 2. Every other night they were syringed freely, and the awning the following morning drawn down until the leaves were quite dry; thinking that the spot might be caused by the sun coming upon them when wet, and scorching them. Twice a-week, after they had shown bloom, they were watered with liquid manure made of sheep's-dung. All went on well until the first week in May, when the spot made its partial appearance; and on this occasion, the day having been very hot, I used the syringe at night very freely, and left the front windows a little open; the next day I perceived the appearance of the spot on the most succulent leaves of one or two plants, and those the most luxuriant in growth. I at once concluded that my previous opinion of its arising from over-watering and damp was correct, and it was founded on the following case:—Last autumn I had a large plant of the Dropmore Scarlet in fine health, which flowered all the winter. In March it was cut down, to supply cuttings for bedding out, and placed under the stage, not much shaded, and removed out of the way of drippings from pots overhead. The ends of the shoots were touched with quick lime, which immediately checks all bleeding. It was kept dry for a few days, and then watered; not breaking freely, it was well syringed, and received a good deal of moisture. It broke from 12 eyes, and every leaf was covered with the spot. I removed them all, put the plant in a dry place on the stage, and the next growth of leaves was perfectly free from spot. I have no doubt the disease was caused by over-watering and damp: if it was the soil, the plant would have been diseased the previous year. Since the appearance of the spot, I have ceased syringing, and given less water, and it has not spread or appeared upon the other plants.—*An Old Subscriber.*—— Another correspondent, signing himself *J. W.*, states that early last May he placed some of his best plants in a common garden-frame, to retard their flowering. They were placed on coal ashes and kept as cool as possible, and in a short time they were completely spotted. About the middle or end of June the plants were cleaned and placed in a Vinery, where they had plenty of air, and were dry. In due time they recovered, and flowered beautifully. Our correspondent imagines that it was not the soil, but the cold and wet they were subject to in the frame that caused the spot, as May and June last year were cold, wet months; and he writes that plants growing in the same soil, but in a greenhouse, were not at all infected with the spot. He remarks that this year, out of a collection of 500, there is not a spot amongst them, and they are in all situations, from the conservatory to the open air.—— *Mr. Parker, of Elm Grove, Roehampton*, writes as follows:—"I conceive that spot is occasioned by sudden transitions of heat and cold, and not by the soil, as is generally supposed; for instance, last September was very hot, and the early part of October was very cold, consequently, the plants received a sudden check. When my plants were housed for the winter, I picked off all the infected leaves, and kept the temperature of the house at from 45° to 50°, by fire heat. The plants were syringed on fine days early in the afternoon, so as to allow the leaves to get dry before night, and air was freely admitted early in the morning. This treatment soon induced the plants to assume a healthy appearance, and they have been perfectly free from spot ever since. They have been re-potted in the same kind of soil that they were growing in last autumn; therefore, if the soil caused the spot, it would have re-appeared before this time. A friend had Pelargoniums very much infected with this disease; the cause of which I attribute to cold and damp, as his plants were removed about the latter end of February, from the house where they had been growing all the winter, into cold damp pits."——"I have lately built," says a *fourth correspondent*, "a greenhouse exclusively for Pelargoniums, with a low roof and a stage raised up well to the glass. It is heated on Mr. Rendle's tank system, and up to April the plants were progressing rapidly. A quantity of Dahlias put in to force were placed over the tank and plunged in a bed of sand, which was kept moist, and had usually from 5 to 6 gallons of water poured on it every day. I keep up fires at night to force the Pelargoniums into flower. The greenfly having made its appearance, I tried, for the sake of experiment, syringing with an infusion of quassia, in the proportion of ¼ lb. to a gallon of water. I continued to syringe them with this for three or four evenings, closing up the house early. In about a week afterwards the plants looked very sickly, and have continued unhealthy ever since; they have nearly lost all their leaves, and those that remain are blotched all over, similar to those I have sent for your inspection. I wish to know whether this is the effect of the quassia, or whether it is caused by the dampness of the house, owing to the evaporation from the sand, together with the syringing, or from some other cause. The house was shut every evening, and in the morning the plants were quite wet, owing to the water becoming condensed on the roof and falling back on the plants; but this was the case before the change took place as well as after.—*C. K. C.* [This is a case of spot; and seems to be explained by the valuable observations of an "Old Subscriber." The quassia had nothing to do with it.]

Chicory.—On reading your Leader and correspondent's remarks on the article of Chicory, I could not resist a smile; for really, to a person unacquainted with the article, it would appear a direct road to fortune. I have been for the last two or three years communicating with several members of the Government relative to the article, and at last, after the many thousands—nay, I may truly say, hundreds of thousands—the revenue has been deprived of by it, I have the satisfaction of seeing the present Chancellor of the Exchequer admit it to be used for adulteration, to the loss thereof. If it was only used as generally understood, as an addition or improvement, as some poor tastes have it, the stuff might be tolerated; but when it is well known that hundreds of tons of low pulse (damaged by fire and water, or any other way to which it is liable) are made into Hambro' Powder, and fifty other matters are all made into coffee by the addition of a tithe of the real article, to the cruel imposition on our poorer classes, who, from the vile practices of adulteration, generally get but a small portion of their hard earnings, how will it be possible, if coffee is to be a leading article for the benefit of the revenue, to permit its cultivation? No: the Chancellor has found, after giving France that benefit many years, to the serious loss of the revenue, that it must now be stopped; and depend upon it, it will ere long be treated as tobacco—others must grow it, and we get it only by paying a heavy duty. So great a hold has this spurious matter taken of the consumer, that a genuine article of low quality is unsaleable.—*Anti-Adulteration.* [Our correspondent could hardly have used a stronger argument against his own views, than the admission in the last paragraph that Chicory has taken a great hold of the consumer. That shows, conclusively, that Chicory improves the quality of coffee—as indeed is notorious. We submit, with much deference, that there is a wide difference between *mixture for the sake of raising quality*, and *adulteration for purposes of fraud.* French coffee is celebrated for its excellence. Would the French give up mixing it with Chicory? We suspect not.]

Bees.—I have taken lately a glass of honey weighing 5¾ lbs. (glass included). Before putting on the glass, I laid a sheet of white paper over the top of the hive (one of Nutt's), cutting a hole for the passage; by which means there was scarcely any adhesion to the wooden top. My Bees would have swarmed on the 10th, had I not opened a side-box. I find the drawers under Nutt's hives of the greatest inconvenience. I opened one by accident, and found it full of Bees, mostly dead, having forced their way by the tin covering. I have now pasted them up; as a means of feeding, they are perfectly useless, as I never found the Bees could get back into their hive from them.—*Phin, near Wrotham, Kent.*

Bee-flowers.—Some time ago, a correspondent denied the correctness of my statement as regards the Polyanthus being a bee-flower. The Polyanthus is almost the first spring plant in bloom, consequently, the bees, it may be, are under the necessity of making use of it; afterwards, when flowers get plentiful, they may prefer others. I only speak of it as an early bee-flower, for the truth of which I can vouch, having seen thousands of bees on it from my hives, and often been very much in danger of being stung when gathering the flowers; I therefore again deliberately state, that the Polyanthus tribe are valuable early bee-flowers. The following is a list of flowers to which bees are particularly partial:—

Canterbury Bells.	Mignonette.	Grape Hyacinth.
Wallflowers.	Brassicas.	Marigolds.
Roses.	Sweet William.	Eschscholtzia.
Borage.	Columbine.	China Asters.
Lilies.	Pinks.	Dahlias, and
Beans.	Asperula.	Marvel of Peru.
Stocks.	Penstemons.	

—*Apius.*

Heating.—On reading the article of your correspondent "Dion," in a late Number, I thought I would send the accompanying plan, which I have had in use for nearly two years past. It is on a small scale, and chiefly used for the purpose of having hot water at command to mix with cold for my Vines. My grapehouse is heated with a brick flue; the fire-place is about three feet from the front wall; a cast iron pipe, about two inches in diameter, is carried through this front wall to the fireplace, thus; the two open ends of the pipe are introduced into a wooden tank, about two feet long, four feet wide, and eighteen inches deep. This is

kept filled with water, which will boil in about half an hour after the fire is lighted, as here is a constant circulation through the pipe into the tank. Indeed, it is quite a stream out of the top end of the pipe. This tank is covered with a large piece of board (slate would be much better) on which rests a frame made of wood, about one foot deep, and filled with earth, which is always warm enough to strike cuttings or raise seeds in; but if not well attended, it gets too hot, owing to the small size of the tank. I imagine if I had an iron tank the whole length of the house, this small bit of pipe introduced at one end would keep the whole body of water sufficiently warm, to throw out a good heat from the iron sides into the house, and if covered with slate, the earth on the top could be kept at an equal temperature.—*I. S. K.* [To be sure it would.]

Asparagus.—I have an Asparagus bed, thirty feet by five feet, on which I put one cwt. of salt, about the middle of March, last year, and also this year. The increase of crop, both with regard to size and number, is most extraordinary; I intend to continue the one cwt. of salt for this bed every March.—*I. S. K.*

The Robin.—In a late Number appeared a very interesting anecdote of an "affectionate" robin. Your correspondent has, however, I would presume, seen little beyond the "sunny side" of this bird's character. I grant the robin has some very striking good qualities; but "more remains behind." I have made the study of birds a very favourite pastime for the last 14 years, my collection seldom averaging fewer than from 200 to 300 of nearly all kinds, including nightingales, blackcaps, bubillards, &c. &c.; and I have had as many as 17 robins in cages at one and the same time. My observation during the above period, compels me to say that, if of these "affectionate" birds, 20 males were let loose in one room, not three would be found alive the next morning; and even these survivors would be desperately wounded. Their strength alone has saved them (unless indeed they have studied the "whole art of war"); and opportunity alone is wanting for each one of them to receive from the other his quietus, which is inevitable, if they continue together. If robins, confined in cages, are expected to sing, they must on no account whatever be permitted to see each other, for their jealousy exceeds, if it is possible, that of women; and, once provoked, they are nearly as irreconcileable. Thus much for their foibles. I will now give you an instance of their gentler nature. You will thereby see, not only how possible it is to tame a robin, but to mould it to your entire will. In the autumn of last year I took possession of my present residence, and being alone for a week, until the arrival of my family from town, I rose as early as half-past four in the morning, to attend to my cage-birds, which I fed on a table in the back garden. While employed in this operation, I perceived that I was closely watched by a very elegantly formed, fine, stout, robin, who seemed bent on ascertaining whether or not I was a friend to his tribe. Within three days, his mind, on this point, was set at rest, and he became my constant guest, in doors, in the garden, on my shoulder, on my finger; and to sum up all, I taught him, at command, to perch himself firmly on the bridge of my nose, and to take a meal-worm, while thus seated, from my hand. It would often happen, on my return home, that he was in Ravenscourt Park (which adjoins my garden); at such times, I had only to give a peculiar whistle, and he would be at my side in a few moments. Finally, our "engagement for the season" terminated only two months since, when my little friend committed matrimony. He is now teaching his young family, four in number, how to fly, and is in the garden the greater part of the day, singing joyously. His great familiarity, however, is suspended *pro tem.*, and I can scarcely expect that his instinct will permit him to return to his old habits of strict intimacy until August.—*William Kidd, New Road, Hammersmith.*

Sporting Laburnum.—Several years ago I purchased of a nurseryman, and planted in my garden, a purple Laburnum, which was grafted, as I imagine, on a common Laburnum-stock; the tree has never assumed the drooping growth of the common Laburnum, nor has it flowered very profusely, nor the bunches been so long as those of the Laburnum usually are; but this year there are three bunches of yellow flowers, one at the extremity of a shoot of last year, and the other two in that part of another branch which was the growth of the year before last. Just below these bunches, and in the wood of the same year's growth, are three shoots of last year's growth, about twelve or fourteen inches long, having throughout the whole length the small foliage and light purple flowers of a distinct species of Cytisus, the latter being single, of a less faded appearance than the Laburnum, with short flower-stalks; and further up the same bough, on the growth of the same year, there are three bunches of purple flowers similar to those hitherto produced on the tree, and further up the same branch, on the growth of last year, another bunch of purple flowers; the whole are certainly the growth from the scion, and no part from a bud below, where the scion was inserted. No seed has ever been produced in former years, and I have always considered the scion with which the tree was grafted to be a hybrid between the Laburnum and some other Cytisus. I think I have read in one of Loudon's publications that the purple Laburnum was a hybrid which has the peculiarity of losing its hybrid characters, and returning to that of one of its original parents; but surely my specimen is still more extraordinary, from the triple character of the flowers. I shall anxiously watch the progress of the yellow and smaller purple flowers, in order to ascertain if they produce any seed.—*C. T. W., Buntingford.* [We must refer our correspondent to the discussion upon this subject, which took place at p. 325, 1841, and at p. 397, in the volume for 1842.]

Transplanting.—Having had considerable experience in transplanting, I shall state the method I have always pursued in the removal of large trees or shrubs. I first form the pit, where the plant to be removed is to be planted; it is generally taken out from 12 to 14 inches wider than I consider the roots will reach. This is of great importance for the welfare of the newly-transplanted plant, as it gives it room to extend its roots until it has again got established in its new situation. In lifting Laurels, &c., I always bind up the plant with strong straw ropes, tying one end of the rope to one of the strong branches in the centre of the plant, and, taking up all the branches, I cause them to be drawn into as small a compass as possible without injuring the plant, and thus the operation of lifting can be performed with more ease. The roots are then cleared; and, suppose the plant to be common Laurel, six or eight feet high, begin as many feet from the main stem (I generally commence as far out as the branches extend,) and cut a trench round the plant at the said distance from the centre, as deep as it may be supposed the roots have gone down. I then reduce the ball by degrees with a three or four-pronged fork, cleaning out the mould with a spade as I go on, and taking care not to injure any of the roots or fibres. These I generally tie up in trusses with matting, in order to prevent them as much as possible from being injured. I very often clear the roots to within two or three feet of the main stem, and then undermine the solid piece that is left; I, however, do not attach much importance to the ball left at the plant; the only thing is, that a small ball helps to keep the plant steady until it has again made fresh roots. When the plant is ready for removal, the strength for lifting it will depend upon its size, and the weight of the ball left, if any. I have, however, lifted larger plants with three or four men, by keeping all the roots as entire as possible, and paying little regard to balls, than I have seen ten and twelve men lift with balls, the plants having no more roots than what the ball contained; and those I planted without balls grew away vigorously, whilst the others remained in a languid state for years. When the plant is brought to the pit and placed in the centre of it, untie the roots, and dress with a sharp knife any that may have been bruised. I generally shorten strong ones, that they may make young fibres, upon which the welfare of the plant in a great measure depends. After dressing the roots I lay them all carefully out round the pit. If there are one, two, or three layers of roots, as is often the case, keep each layer by itself, and lay out the undermost first, taking care to spread out every fibre with the hand. On these spread well broken mould; but in doing this care must be taken not to club the roots together. After the first layer of roots is well covered proceed with the next, and so on until all is finished. After transplanting I never give the plants water oftener than once, which is immediately after the operation of planting is performed. I have sometimes given a plant water in dry weather, merely as an experiment to satisfy myself with regard to its utility, and I have always found it injurious to the plants to which it was applied; they soon began to assume a sickly appearance, and I am convinced that there are many young trees and shrubs destroyed (after having been transplanted) by the frequent application of water in dry weather. My method is, after the roots are all well covered to leave the pit three or four inches unfilled, and I apply the water according to the state of the soil and size of the plant. To a shrub that covers about 4 square yards of ground (if the soil is not very moist), I generally give about eight common sized watering-potfuls, and so on for every square yard of ground covered. Some writers recommend pouring the water over the roots through besoms, &c., but I pour it in at once from the pot, and as soon as it subsides a little, I fill up the pit. The only treading I ever give the plants, is merely what may take place in going round them, in taking away the rope, and spreading out the branches in their original position. The above remarks apply well to the common and Portugal Laurel, and also to deciduous trees and shrubs in general. I shall now mention a few kinds that are difficult to remove without balls, when they are large plants. The Holly is one that is impatient of being removed without a ball, and in free light soils it will not lift with one. The method I adopt with it is this:—two years before removal I generally open a trench round the plant, about two feet from the main stem (more or less according to its size); two feet will do for a plant six feet high. I go as deep as I find roots, and cut clean off all those outside of the ball, and again fill in the mould. In about two years afterwards, the cut roots shall have made firm young fibres, which supply the plant with food when it is transplanted. In lifting them I always try, if possible, to get a good ball at them. By this method I have succeeded beyond expectation. The Laurustinus is not very fond of being removed without a ball, when it is large; but as it is in general not so large as the majority of evergreens, it is more easily lifted with a ball. In one year I transplanted about 100 after they had attained a considerable size, and very few of them had good balls; but I kept all their roots as entire as possible, and by so doing I only lost one plant. There are but very few of the Fir tribe that can be transplanted after they have got to any size. The only kinds I have lifted after they have attained the height of from six to sixteen feet, are the Silver, the Spruce, and the Weymouth Pines; with these I have been very successful. The Silver Fir bears transplanting tolerably well, provided care is taken not to injure the top roots, which run horizontally near the surface. I have lifted and replanted Silver Firs from four to fourteen feet high. The Spruce lifts well; I have transplanted them sixteen feet high. I have also transplanted the Weymouth Pine from ten to twelve feet high; of these kinds I have never lost a single plant. In lifting them I always tried to get as good balls as I could with them. I have, however, transplanted them without balls, and treated them in the same manner as evergreen shrubs, keeping all their roots as entire as possible, and making the pits wherein they were to be planted large, so as to get all their roots spread out as regularly as possible; when covered, they were watered in the same manner as the shrubs. In lifting and transplanting hard wood, such as Oaks, &c., I seldom leave any balls at them; I merely keep their roots as entire as possible, and shorten in any strong ones; they should be well watered. It is very essential to the welfare of plants that have been transplanted, to have them well supported, to prevent them from shaking with the wind, &c. For trees from 10 to 20 feet high, I generally use three poles, set up in the form of a triangle; I roll a straw rope round the stem of the tree (at the height which I consider will be necessary for keeping it steady) for the poles to rest on, as it prevents them from hurting the bark; then, after tying the poles firm to the tree, and fixing them in the ground, the work is finished. For plants of smaller size, I generally use small rope, tied in the same manner to the tree, and fixed to stakes driven into the ground. With regard to the season for transplanting evergreen shrubs, I can scarcely give any correct opinion, as I have transplanted evergreens in every month of the year, and never lost a single plant. No doubt, the summer months are not proper for such work, therefore it should be avoided, if possible. From October to April all shrubs, &c., may be lifted with safety. I prefer the month of November for lifting large plants, if I can get it done, as those planted about that time always send out young roots during winter; I have examined them frequently in February, and found them to have made young roots from 1 to 3 inches long. Nothing need be said regarding American shrubs, &c., as, if care is taken, they can be lifted with propriety at any time. Healthier and finer specimens of tree and shrubs than those I have transplanted are seldom to be met with.—*A Caledonian.*

Spring Planting.—I doubt not that your observations on the superiority of autumn planting are unquestionable; yet, as far as my experience goes, I have always succeeded better with the common Laurel, by planting in spring. In any attempt to move Laurels 3 feet in diameter in the autumn, I have generally lost the greater part of the wood. But, by planting with care, and paying a good deal of attention to moisture in spring, I have invariably succeeded in saving the whole previous growth. I do not notice this fact in opposition to your statement, but with a view to obtain an explanation of the anomaly.—*E. C., Chipperfield House.* [It is not possible to explain this without knowing more about the manner in which the autumn-planting was effected. We can state, that in stiff clay, the worst of all soils for a planter, autumn-moved Laurels are far more successful than the spring-moved.]

Durmast Oak.—"Rufus," in a late *Chronicle* says, that the wood of this is soft and brittle, which is at once a contradiction. The remarks relating to the length of the stalk of the Acorn being indicative of the species, are uncertain; the only correct means of ascertaining this is by the flower. I have frequently marked this species previous to felling, and in no instance have I been mistaken. The superiority of the timber of the white-hearted species over that of the red, for all purposes, except perhaps for furniture, is well known to persons in the habit of purchasing the article. The trunk of the former is generally of larger dimensions, and is of a rough and gnarled nature, admitting of its being split into rails, &c. The red-hearted species, on the contrary, is brittle as glass. Serious losses often occur to merchants, who frequently pay from 60*l.* to 100*l.* for a single stick, imagining it to be the Durmast; but on felling it they find it to be the red-wooded, which at once condemns it, this species being from 50 to 75 per cent. less in value. About 40 years ago the late W. Morrice, Esq., was employed by the Government to purchase Oak timber of large dimensions in Holland. Having to float it down rivers and canals it was found that the Durmast on account of its great weight would not swim, and they had therefore to fasten two pieces of Balk to each stick to enable them to float it along with the red-hearted, which required no such aid. The requisite quantity was collected; but previous to its being imported the French beset the place. Before this occurrence, however, the timber was safely secured in deep mud at the bottom of the canals until 10 or 12 years afterwards, when it was taken out and found to be perfectly uninjured.—*W. R., Stoney Cross, New Forest.*

Rats.—Much has lately been written about rats; I have had troublesome ones to deal with, yet my simple plan has always caught the intruder. Get an iron slam, and should it have been used before, put it on the fire, to remove all smell from rats previously caught, or the smell from the hands of the rat-catcher. Get a piece of new and white calico rather larger than the trap; after setting, place calico all round and tuck in the corners. Place it in their runs. I have caught so many this way, others may do the same. No bait on top.—*G. C.*

Bourbon Roses.—If cuttings of these are put under a hand-glass about the end of this month, and struck with a little bottom-heat, they will be fit to be potted off in August, in large 60-pots; let them be kept in a cold pit till January, and then brought into the forcing or greenhouse; they will continue flowering from beginning of May, till late in autumn. Armosa, Augustine Lelieur, and Prince Albert, are the three best for forcing, as they bloom very freely, and are exceedingly sweet-scented.—*Charltoniensis.*

Morphology. — Having read in the *Chronicle* of plants under certain conditions forming flowers instead of leaves, I beg to state the following, which by accident came under my notice. Having several large Fuchsias in my greenhouse of a very old kind, I resolved to turn some of them into the flower borders. Accordingly the first week in March I took some of them out of a house to make room for other plants, and placed them in an old lodge to protect them from frost, where they were almost entirely excluded from both light and air. Examining them about three weeks since, I was quite surprised to find that one plant was full of flower-buds, with scarcely a leaf on it, whilst those which were left in the greenhouse were in full leaf without flowers: I took it back to the greenhouse again, and in a few days it will be one mass of blossom. Can any of your correspondents explain the cause of this? — *A Young Gardener.* ["R. E." will probably explain this some day.]

Abies Religiosa.—The hardiness of this graceful Fir is a very important and remarkable fact, after so much

experience, and such, I may say, universal belief to the contrary. When at Bayfordbury some months back, I was gratified to find this tree on a very frosty day, and the ground partially covered with snow, quite unprotected, and in as good health as those excellent plants which adorn the great conservatory in the gardens of the Horticultural Society. We may learn from this, that the exposed situation tended to the production of shoots which were shorter and better matured, than on plants placed in sheltered situations, with great depth of soil, which encourages autumnal growth of wood that is quite soft and green, and which, as a matter of course, falls a sacrifice to the first frost. If this tree was planted on exposed situations, or otherwise on raised mounds of stones, with a thin layer of light soil, to control the luxuriant tendency which this has, in common with many other trees at a similar age, there can be but little doubt of its being at least as hardy as the "Silver Fir."—*R. Glendinning.*

Adulteration of Wheat-Flour.—Mention is made in the *Chronicle*, of the adulteration of Wheat-flour with Lolium, and the means of detecting it. There is one mode of examination which I conceive would be infallible. Moisten a very small portion of the flour, and place it between two plates of glass, in the focus of the microscope. The gluten will dissolve from it, and the starch-grains will be seen floating; they are completely round and plain in the surface, rather flat, like a bun, and they are generally of two sizes; they wear the aspect of

the figure here given. If any other grain has been ground with the Wheat, the form of the farinaceous fecula will betray it. I have no difficulty in discriminating Beans, Peas, Oats, or Barley, if they are intermixed. Lolium I have not at the moment the opportunity of examining. But I have been for some time in the habit of testing purchased flour in this way. The grinding does not bruise the substance to an impalpable or amorphous powder, but only separates the farina into its natural constituent particles; and, I doubt not, the Lolium has a peculiar form, different from that of Wheat, which would be at once discernible. If there is any amorphous matter visible in the field of the microscope, it is an adulteration of some kind or other.—*E. C., Chipperfield House.*

Miscellaneous.—*T. B.* states, that by way of experiment he left some of his Dahlias out all winter in open beds without any protection whatever. He finds that they are much more strong and healthy than those under cover in pits. He adds, that most of them in the open border are from a foot to 14 inches high. The same correspondent is of opinion that Dahlias might be rendered hardy without much trouble, and that, by being out all winter, he imagines they would be less liable to be affected by frost early in autumn.——*A Correspondent* informs us that Eccremocarpus scaber has stood the winter with him in a very much exposed situation. He states that it has not had the slightest protection, and that it is now in a very vigorous state.——We have learned from the writer that the Gentiana verna, mentioned by *R. T.*, last week, as a plant well suited for edgings, but neglected, is, as we suspected, G. acaulis. How so common a plant should be called neglected, passes our comprehension.

Societies.

HORTICULTURAL SOCIETY.

THE first of the annual series of Grand Exhibitions, under the auspices of the Horticultural Society of London, took place in the gardens at Chiswick on Saturday last. The day, for the 18th May, was singularly unpropitious, the morning being ushered in by a frost registering as much as six degrees in some localities, and a strong north-east wind, increasing at times to a hurricane, accompanied by occasional storms of rain prevailing throughout the day. But notwithstanding this, a great number of very splendid and valuable plants were brought together, and too much praise cannot be awarded to the zeal of those gentlemen and gardeners, who subjected their plants to such inauspicious elements. Such enthusiasm is a proof that the exhibitors are not the mercenary individuals that some would insinuate they are, but that they are desirous of promoting the science of Horticulture, and of ministering to the gratification of the public, even though it be by the sacrifice or material injury of some of their greatest favourites. The gardens were in finer trim than could have been expected after so much dry weather, and the Azaleas and Rhododendrons were blooming more profusely than we have observed them in any other garden this season. This, we are informed, is partly attributable to the plants having been manured or mulched with rotten cow-dung, which by keeping the ground moist and cool, enabled the plants twelve months back to complete their growth and set their bloom before the wet weather of July drove them into a second growth, by which growth multitudes of plants are destitute of bloom this season. The bloom on the large Wistaria, so generally an object of attraction at the first fête, was fast fading away; but in the conservatory the plants were in rude health, and many of the climbers blooming profusely. The large plant of Altingia excelsa will reach the top of the house by the autumn; and the huge bush of Luculia gratissima, the most lovely of our winter-flowering plants, is still progressing in size.

The LARGE COLLECTIONS were less numerous than usual, and also less brilliant—a difference mainly attributable to the rule which prohibits those kinds of plants being exhibited in collections for which prizes are offered in separate classes. In the collection exhibited by Mr. Robertson, gr. to Mrs. Lawrence, Ealing Park, was a fine specimen of Tabernæmontana coronaria, evincing excellent management, and densely covered with its pure white deliciously-scented flowers. Another very remarkable plant was Leschenaultia biloba, the pale variety; it was about 3 feet high, and 4 feet in diameter, regularly furnished with branches in every part, and producing a great number of delicate azure-blue flowers; this is not so fine a variety as some that will be adverted to hereafter, but nevertheless is a fine kind. This collection, moreover, contained an immense bush of Pimelea decussata, 5 feet high, and as much in diameter; another specimen of the dark variety of the same plant, 18 inches high, and 9 feet in circumference, in the most robust health; a fine plant of Eriostemon myoporoides, 8 feet high, and covered with bloom; a well-grown specimen of the beautiful Polygala bracteolata, the flowers of which did not expand, owing to the dullness of the day; with fine specimens of Eriostemon buxifolium; Epacris ceræflora, producing spikes of delicate white flowers; Coleonema tenuifolium, very neat; Chorozema macrophylla, in fine bloom; Hovea Celsi, an old plant, which had been cut down and produced a number of branches from the bottom, which formed a dwarf bush; Dillwynia floribunda, dwarf and good; Aphelexis sesamoides, very rich; with a species of Daviesia, with a profusion of orange and dark-red flowers on a very well-grown plant. In the same collection was an immense plant of Erythrina Crista-galli, 8 feet high, and 20 feet in circumference, in the most exuberant health; a well-bloomed plant, 4 feet high, and 5 feet through, of Chorozema Henchmanni; neat plants of Loddigesia oxalidifolia, Cytisus filipes, and Boronia pinifolia, with a large specimen of Pimelea spectabilis, thinly covered with bloom, and bearing evidence of bad management in its infancy. In a collection of fifteen plants from Mr. Green, gr. to Sir E. Antrobus, Bart., was a large bushy plant of Leschenaultia biloba grandiflora, the dark-blue variety, splendidly covered with bloom, and 3 ft. high, and about the same in diameter. A plant of L. formosa was likewise in fine condition, profusely covered with bloom, as were also Daviesia latifolia, trained in a pendent form, with Gnidia pinifolia, and Pimelea rosea and hispida. A specimen of Chorozema varium in the same collection was particularly well bloomed, though the plant was evidently in a declining state. Another plant, bearing some resemblance to a Spiræa, was Acrophyllum venosum, in a very healthy condition, and blooming freely. Aphelexis humilis was produced in a fine state; but the large plant of Rondeletia speciosa was not quite sufficiently advanced. Another collection of fifteen plants was sent by Mr. Clark, gr. to the Earl of Eldon, Shirley-park. It contained a fine specimen of Chorozema cordatum, 8 ft. high by 6 ft. in diameter, profusely covered with bloom, but in a rather loose condition; good plants of Stephanotus floribundus, Zichya inophylla, floribunda, and coccinea, and Hardenbergia monophylla, trained on flat trellises and densely clothed with flowers. There was, moreover, a large and well-bloomed plant of Boronia denticulata, but rather naked in the bottom; a tolerable plant of the double white Primula, with Eutaxia pungens, Chorozema Dicksoni, and Leschenaultia biloba, spoiled by unskilful training. Collections of six plants were shown by Mr. Bruce, gr. to Boyd Miller, Esq., Colliers's Wood, Mitcham; Mr. Frazer, of the Lea-bridge Road, Leyton, Essex, and Mr. Stanley, gr. to H. Berens, Esq., Sidcup, Kent. In the group by Mr. Bruce, was a lovely plant of Aphelexis humilis in the most perfect state; a neat plant of Eutaxia pungens, dwarf, bushy, compact, and profusely bloomed; a large specimen of Ixora coccinea in fine condition, but drooping from the coldness of the day, with well-grown plants of Leschenaultia formosa and biloba, and a charming specimen of the old Adenandra fragrans, covered with its peculiarly-tinted rosy-pink flowers. Mr. Bruce, moreover, exhibited as single specimens very splendid plants of Pimelea spectabilis and Adenandra speciosa, a plant probably better known by its old name of Diosma speciosa. The Pimelea spectabilis was certainly one of the gems of the exhibition, and though not so large as the specimen exhibited last year by Mr. Goode, was in every respect as perfect as a plant possibly could be. It was about eighteen inches high and three feet in diameter, regularly covered with bloom, and so complete in all points that it would have been difficult for the most fastidious to have said "A leaf there or a flower here would improve it." Mr. Frazer's collection contained a very healthy specimen of Boronia serrulata, an immense and profusely bloomed plant of Pimelea linifolia, a neat and very healthy specimen of Epacris pulchella, producing spikes of white flowers, and specimens in rude health of Polygala acuminata, Epacris grandiflora, and Chorozema varium. The best plants in Mr. Stanley's collection were a large and particularly healthy specimen of Chorozema cordifolium, a young but remarkably well-grown plant of Leschenaultia formosa, pretty specimens of Zichya inophylla floribunda, and Achimenes longiflora in fine bloom, and a promising young plant of Gompholobium polymorphum. Mr. Beck exhibited a well-grown plant of Achimenes longiflora in a slate pot.

Collections of CLIMBING PLANTS were shown by Mr. Robertson and Mr. Frazer, and some single specimens by other growers. Mr. Robertson's plants were—Manettia cordifolia, trained on a large globular trellis, completely covered with branches, and liberally flowered; Manettia bicolor, trained spirally to the height of 4 feet, well furnished, and as well flowered as this plant well can be at this season, as it is strictly a winter plant, and one of the most useful we have; an immense plant of Hardenbergia Comptoniana, trained over a barrel-shaped trellis, was in profuse bloom,—a proof that this plant requires age before it will bloom properly in a pot, as small plants have hitherto been shy bloomers, which has caused it to be discarded by some growers. Hardenbergia monophylla, in the same collection, was scarcely less noticeable, and there were also fine plants of Zichya inophylla floribunda and Gompholobium polymorphum. Mr. Robertson also exhibited, as single specimens, a noble plant of Stephanotus floribundus, trained spirally, the trellis covered as thickly as possible with branches, and singularly thickly covered with bloom-buds, though but few of them were open. Another plant, sent by Mr. Robertson, was Echites hirsuta; but it was drooping from cold before it was taken into the tent. From the same place were several plants of Gompholobium polymorphum in good condition, but thinly bloomed; and the whole of the plants of Tropæolum tricolor and Jarrattii, though many of them were well grown, were destitute of that brilliancy of colour for which they are generally so much admired.—In the collection of Mr. Frazer were two exceedingly well-bloomed plants of Hardenbergia monophylla and longiracemosa, trained over cylindrical trellises; good plants of Zichya coccinea and Gompholobium polymorphum in good condition; and a well-grown but thinly-bloomed specimen of Sollya angustifolia; a plant of the singular Philibertia grandiflora, trained on a flat trellis, sloping at an angle of about 60° from the spectator; a most admirable arrangement to prevent the flowers from being seen. The form of the flower in this plant ought to be suggestive of the form of the most appropriate trellis.

Of the singular and universally interesting tribes of ORCHIDACEOUS PLANTS there was a grand display, large collections being exhibited by Mr. Mylam, gr. to S. Rucker, Esq., Mrs. Lawrence, and Messrs. Rollisson, of Tooting. In the collection of Mr. Rucker we noticed a very splendid plant of Dendrobium fimbriatum, studded with hundreds of its beautifully fringed orange flowers; an enormous plant of Acanthophippium bicolor, the surface of the pot among the pseudo bulbs being literally alive with flowers. Dendrobium sanguinolentum, exceedingly neat; Cattleya Mossiæ and several varieties; Cattleya intermedia, strikingly beautiful; a species of Eria very like E. bractescens, and the elegant Phalænopsis amabilis, with a fine spike of bloom. Rivalling the latter plant in beauty, was the lovely Odontoglossum citrosmum, with delicate white and pink flowers; the singular Coryanthes macrantha, with two fully expanded blooms, and others coming on; a fine plant of Brassia maculata, with seven spikes of bloom; and Zygopetalum rostratum, with two fine flowers. There were, moreover, fine plants of Vanda Roxburghi and tessellata; Huntleya violacea, with four blooms; Cymbidium lancifolium, very pretty; Stenia pallida, with pale lemon flowers; a fine plant of Saccolabium guttatum, with four fine spikes not quite in bloom; a new and curious Anguloa, of a pale brown colour, the flowers spotted with dark brown; Maxillaria aromatica, and fine specimens of Oncidium sphacelatum, pictum, and divaricatum. The collection of Mrs. Lawrence, though not quite so rich in new plants, contained many admirable specimens; among them, Saccolabium guttatum, with four spikes of bloom in great perfection; Peristeria cerina, with delicate creamy yellow flowers; Maxillaria aromatica, studded with orange-yellow blooms of great beauty; Cattleya Skinneri; Epidendrum cinnabarinum; Huntleya violacea; Zygopetalum rostratum; with the charming Aerides affine, in fine bloom; and a splendid specimen of Aerides odoratum, with eight spikes of noble flowers. In addition to these, there were large plants of Oncidium flexuosum, luridum, ampliatum, the major variety, altissimum, with eight spikes of bloom, each seven feet high, pulchellum, very delicate, with good plants of leucochilum and Baueri. The appearance of this collection, with the Oncidiums waving in the breeze, was very rich; and the plants were in admirable health. The plants in the collection sent by Messrs. Rollisson were generally small; and the most remarkable, not before noticed, were Acineta Barkeri, Vanda teres, very fine; the lovely Aerides crispum, with a fine spike of bloom; Stanhopea saccata, with very delicate flowers; Cattleya Mossiæ superba, a grand plant; and Saccolabium guttatum majus, with two splendid spikes of flowers. There was, moreover, a small specimen of the most lovely of all beautiful plants, Dendrobium Devonianum, the flowers of which are so fragile, and delicately fringed and tinted. From Mr. Kennington, gr. to — Cox, Esq., was a singular plant, with the flowers hanging over the side of the pot, of a dull greenish purple colour, and resembling so many insects, called Cirrhæa viridipurpurea; also a specimen of Vanda Roxburghi var. cœrulea, with Cattleya Mossiæ, Aerides odoratum majus, in fine bloom. Mr. Williams, gr. to C. B. Warner, Esq., sent Odontoglossum Bictonense, Epidendrum bicornutum, and several other plants. Mr. Edmonds, gr. to His Grace the Duke of Devonshire, produced Peristeria pendula; and two new plants, one an Epidendrum, with dull purple flowers, enlivened with pinkish violet sepals; and the other, a most charming variety of Schomburgkia tibicinis, were sent by Mr. Moore, gr. to R. Hanbury, Esq.

After the bright weather which we have had lately, it was not expected that many AZALEAS would be exhibited, and consequently the beautiful plants brought by Mr. Falconer, gr. to A. Palmer, Esq., Mr. Green, Mr. Robertson, and Mr. Gaines, of Battersea, were doubly attractive. A plant evincing the maximum of skill in cultivation was

Azalea indica variegata, exhibited as single specimen by Mr. Falconer. It was about three feet high, and from four to five feet in diameter, the branches depending round the side of the pot, forming a depressed pyramid, and literally one mass of flowers, so dense that scarcely a leaf could be seen. On this plant was a singular instance of a sporting branch, the flowers upon which were Azalea indica Gledstanesii, as true as they could possibly be produced, thus evidencing the origin of that fine variety. On another plant of A. i. variegata we noticed a true flower of A. i. lateritia, so that both kinds may be regarded as mere sporting branches of A. i. variegata. Another noble plant was A. i. rubraplena, the double red variety, from Mr. Green, a one-sided plant, six or seven feet high, and superbly bloomed, but the flowers, unfortunately, were in a fading condition. Mr. Green also contributed very beautiful plants of A. i. variegata, lateritia, and Gledstanesii in fine condition, with good plants of A. splendens, purpurea grandiflora, Rawsoni concolor, Smithii coccinea, pulcherrima, in fine bloom, with a nice specimen of A. sinensis, the yellow Chinese variety. In the collection by Mr. Falconer, A. i. Rawsoni was scarcely less beautiful than his plant of A. variegata, and there was also a fine specimen worked as a standard, of A. i. Danielsii, another of the double white variety, not very appropriately named, with A. i. purpurea superba, and two seedlings named Bianca and Pulchra. Bianca is a white variety of dwarf compact habit, blooming profusely, of tolerable form, but rather deficient in substance. A group of six plants, contributed by Mr. Robertson, were exceedingly rich, and, what is so desirable in public exhibitions, bloomed almost to the day. They consisted of A. i. alba, a globular plant, three feet high and six feet in diameter; lovely specimens of Rawsoni speciosissima, lateritia, variegata, and the most perfect plant of A. i. Danielsii we ever saw. Mr. Gaines exhibited a number of small plants, principally seedling, and generally deficient in form. The most remarkable were Salmonia, a pale salmon-coloured variety, Brilliant, a much brighter-coloured variety than A. i. Danielsii, and also kinds worthy of cultivation, named Fairy Queen, Ne plus Ultra, Flaminea, and Delicata.

Of New Plants the most remarkable was a new species of Hindsia, exhibited by Messrs. Veitch and Sons of Exeter. It is a very strong-growing plant with the habit of a Melastoma, blooming freely, producing flowers of a bluish lilac colour, and five times as large as Hindsia (Rondeletia) longiflora. It is a fine plant, and when well grown will make a noble specimen. Another new plant from the same gentleman was a species of Centrosema, producing bright scarlet pea-formed flowers, but as there were only a few flowers open upon a large plant, it is difficult to say what it will make until we are better acquainted with it; but should it produce flowers as numerous as they are beautiful, it will indeed be a splendid object. Another new plant was Cereus crenatus, exhibited by Mr. Booth, gr. to Sir C. Lemon, Bart. The plant in habit resembles C. Jenkinsoni, but the flowers are large, and of a palish straw colour, tinged with green, and bears a close resemblance to the old night-blooming Cereus. To the hybridiser this plant opens up a wide field of action, and we shall look forward with some anxiety to the varieties which will be originated from it. A new species of Hibbertia, of shrubby habit, and producing yellow flowers, raised from Swan River seeds, was sent by Mr. Noble, gr. to R. Mangles, Esq., along with what appeared to be the little known Orthrosanthus cœruleus. There was finally, from Messrs. Loddiges, a very pretty novelty, in the form of a species of Gaylussacia—an evergreen greenhouse shrub, with deep rose-coloured flowers, like those of a Vaccinium, to which the genus is nearly allied.

Among Single Specimens, Messrs. Veitch had bushes of Hindsia longiflora loaded with bloom buds; Xanthosia rotundifolia, in fine health and blooming profusely; and immense plants of Eriostemon buxifolium, and Erica depressa. The latter specimen was one of the most remarkable plants in the Exhibition. It was about two feet six inches high, and two feet in diameter at the bottom, forming a cone of verdure densely covered with greenish-yellow blossoms. The plant, we understood, was 28 years old. The rare Cumingia trimaculata, was sent by Mr. Frost, gr. to Lady Grenville. Three plants of Statice macrophylla, in bloom, were communicated by Mr. Forrest, of the Kensington Nursery, and a Schizanthus, like S. Grahami, not very remarkable, by Mr. Green. A very large plant, sheeted with bloom, of Leschenaultia formosa, was sent by Mr. Clark; a splendid specimen of Leschenaultia biloba grandiflora, by Mr. Falconer; another plant with paler flowers, by Mr. P. Tramer, gr. to Lady Alice Peel; and a pretty specimen of the dwarf variety, called L. biloba nana, by Mr. Green. There was, moreover, from Mr. R. Johnson, gr. to J. Mallet, Esq. a well grown plant of Gnaphalium involucratum; Stylidium odoratum, in fine health, from Mr. Robertson; and a new Gloxinia, bearing a close resemblance to G. Cartonii, with crimson flowers margined with white, from Mr. Dobson, gr. to Mr. Beck, of the Slate Works, Isleworth. This is by far the finest hybrid which we have seen, and merits universal cultivation. Mr. Robertson communicated a large specimen, with many noble flowers, of Cereus speciosissimus; very nice plants of Polygala oppositifolia, and Pimelea decussata, were shown by Mr. Hill, gr. to T. Davis, Esq.; Ixora coccinea, with 30 heads of bloom in fine health, by Mr. Green; a well bloomed plant of Siphocampylus betulifolius, by Mr. Bruce; and a large plant of the old Pelargonium tricolor, by Mr. Jackson, of Kingston.

A number of collections of the gaudy tribe of Cacti were communicated by various growers, but the most distinct and remarkable kind, was a variety of Cereus Mallesonii, called C. M. rosea, sent by Mr. Bruce. It produced small compact rose-coloured flowers, and was very neat and pretty. The collection by Mr. Robertson contained fine plants of Epiphyllum Jenkinsoni, speciosus, speciosus major, and Cereus Ackermanni. Mr. Green showed a noble E. Jenkinsoni multiflorum, loaded with bloom; a good plant of E. grandiflorum violaceum, with noble plants of Cereus Ackermanni, with Epiphyllum Jenkinsoni, and speciosum, beautifully bloomed. Mr. Upright, gr. to Mrs. Ridge, sent a very fine assortment, consisting of Cereus Ackermanni, and speciosissimus; Epiphyllum speciosum, speciosum grandiflorum, and Jenkinsoni. These plants were in fine condition.

The beautiful and interesting tribe of Erica was exhibited in great variety, and excited considerable interest among the visitors. Mr. Brazier, gr. to W. H. Storey, Esq., sent a very beautiful plant of E. gelida, covered with pale-green flowers; a fine perspicua nana, in profuse bloom; a good plant of odora rosea, with good specimens of Humeana, campanulata, Cavendishii, in fine health; a large plant of E. ventricosa grandiflora, not quite sufficiently in bloom; and charming plants in excellent bloom of E. intermedia, vestita alba, and vestita carnea. In addition to these, there were of Mr. Storey's seedlings several very fine varieties, especially ventricosa alba tincta, vestita albida, vestita alba superba, both very good, and a remarkable variety, called E. floribunda. In the collection sent by Mrs. Lawrence were good specimens of E. Cavendishii, the finest of all the yellow varieties; depressa, in fine health; E. suaveolens, well bloomed; and good plants of E. perspicua nana, fragrans, Beaumontia, persoluta alba, ventricosa tricolor, a fine plant, and E. ventricosa coccinea minor. Very healthy specimens of E. Humeana, ampullacea vittata, trossula, intermedia, and ovata densely clothed with bloom, were also shown by Mr. Robertson. Mr. Green exhibited another collection, among which we noticed fine plants of E. ventricosa coccinea minor, profusely covered with bloom, ampullacea rubra major, a good plant of Hartnelli, Humeana, Beaumontia, suaveolens, and gelida, in fine health, and good plants of E. propendens and elegans; E. denticulata moschata, though the plant was in bad health, was a neat and very interesting kind; and Mr. Green had also good plants of E. dilecta, mundula, ardens, Westphalingia, echiiflora purpurea, and ventricosa coccinea. Mr. Dawson, nurseryman, of Brixton Hill, sent a noble plant of E. propendens, 3 feet high, and nearly as much in diameter, very profusely covered with bloom, and in exuberant health; good specimens of E. odora rosea, mutabilis, prægnans, primuloides, very dwarf and pretty; splendens, a large plant, with fine flowers, but rather naked in the bottom; and neat plants of E. Bergiana, campanulata, Linnæoides superba, mundula, and hybrida. In the collection sent by Mr. Jackson, nurseryman, of Kingston, was a large, but rather naked plant of E. moschata, in profuse bloom; a very large specimen of E. elegans, in good bloom; the curious E. halicacaba, with pale-green flowers; a fine variety, called E. tricolor speciosa; a good plant of a seedling ampullacea, and neat plants of inflata and Cavendishii. Most of the plants of Mr. Jackson had evidently been crowded together during the winter, by which their lower branches were much injured. Mr. Frazer exhibited a group of six plants, consisting of E. Thunbergia, a neat specimen, in good bloom; E. propendens, perspicua nana, spuria, ventricosa superba, and Humeana. Mr. Bruce contributed a fine plant of E. translucens, with good specimens of E. Cavendishii and Bergiana, and also ventricosa superba and vestita alba. From Mr. Vockes, gr. to J. J. Wells, Esq., was a splendid plant of E. intermedia, a noble plant of E. Cavendishii, and tolerable specimens of E. Hartnelli, Humeana, and ventricosa carnea.

Of Roses in pots, and also cut flowers, there was a superb display from Mr. Dobson, gr. to Mr. Beck.; Mr. Laing, of Twickenham, Messrs. Lane and Sons, of Berkhampstead, and A. Rowland, Esq. The plants from Mr. Beck were grown in slate pots, were from one foot six to two feet six inches high, and as regularly covered with bloom and foliage as could possibly be desired. The finest varieties consisted of Earl Talbot, rose colour; Great Western, bright rose, blotched with white; Charles Duval, flesh-coloured; Emerance, white, with yellow centre; Rouge Superbe, dark rose-colour; Armosa, Devoniensis, Madame Neuman, rose-colour; and Triumphant. Many of the plants shown by Mr. Laing were what the nurserymen designate half standards, and consequently did not look so compact as dwarf plants; a number of them too were of the French and hybrid China varieties, kinds more difficult to manage in pots than the Chinese and Tea-scented varieties. They were, however, highly creditable specimens, and though second to Mr. Beck's, but little inferior to them. The most remarkable kinds were General Allard, dark rose-colour; General Lamarque, dark velvety purple; Beauty of Billiard, dark red; Belle Marie, rose-colour, very large; Picotee, rose, striped with white; Nouvelle Bourbon, rose colour; Celestine and La Renommée, a fine white variety. In the collection from Mr. Rowland, the best varieties were Jaune, cream-colour with yellow centre; Richelieu, rose-colour; Vanilla, Eugene, Archduke Charles, Goubault, flesh-colour, and Madame Plantier. The collection from Messrs. Lane and Sons was remarkably well-grown, diversified and interesting. The plants were dwarf, clean, rich and good, and in every respect superb examples of fine cultivation. The most distinct and desirable kinds were Theresa Isabella, cream-colour; Comte de Paris, rose; Edward Jesse, rose; Aricie, flesh-colour; Speciosa, rose; Madame Laffay, rose-colour, very fine; La pactole, light yellow; Barbot, fawn-colour, and Armosa, flesh-colour, very fine. Other good varieties were—Grand Capitaine, Taglioni, Bourbon Theresita, Arago, Triomphe de Flora, Paris, and Psyche. Collections of Cut Roses were shown by A. Rowland, Esq., Messrs. Lane and Sons, and Mr. Mitchell, nurseryman of Piltdown. In the collection of the latter gentleman were unusually fine flowers—Aurora, Belle Allemande, Odorata, Princess Héléne, Archduke Charles, Original, Virginian, and Taglioni. Mr. Mitchell also showed a new Rose, called Lamarque Superbe, and said to bloom as early as the White Banksian. It is a flower of fine proportions, of a delicate creamy white colour, very large, and very double, with a petal of fine substance.

Plants in glass-cases, grown according to Mr. Ward's plan, were sent by Mr. Williams, gr. to C. B. Warner, Esq., and Messrs. Lawrence, of 55, Parliament-street; Mr. Warner's plants had been growing in the City of London for nearly four years, and were in fine health; they consisted principally of Ferns and Orchidaceous plants, but the day being cold there was so much condensed vapour on the glass that they could not be very minutely examined. The case was in the form of a church-aisle glazed with sheet-glass. Messrs. Lawrence's plants were grown in a plain Wardian case; they were very small but healthy, but disfigured by common Cut Flowers being introduced among them. A Fuchsia, some Ferns, and other things grown under a bell-glass, were also exhibited by the same.

The Pelargoniums looked unusually well; in colour they were very fine, and in health and growth, with but few exceptions, very perfect. Mr. Gaines, in his collection, in pots of 12 to the cast, exhibited 12 magnificent plants in perfect health and beauty of bloom; among them was a fine specimen of Nymph, the first large plant that has come under our notice. This having been always considered a shy bloomer, we were glad to see it on this occasion covered with its elegant flowers. Sylph, Victory, Cyrus, Grand Duke, &c., were covered with bloom, many of the plants measuring full four feet across. The following formed this collection, to which the silver-gilt medal was awarded:—Coronation, Nymph, Juba, Grand Monarch, Emperor, Cyrus, Rising Sun, Mabel, Comte de Paris, Grand Duke, Sylph, and Victory. Mr. Catleugh's collection, which took the large silver medal, were the following sorts (and among them a splendid specimen of Garth's Witch excited much attention), Sylph, Unit, Witch, Coronation, Ovid, Una, Jubilee, Madeline, Favourite, Cyrus, Tasso, and Maid of Honour. In Pelargoniums, comprising 12 new and first-rate varieties, in 24-sized pots the amateur exhibitors shone conspicuously, and three better collections, exhibiting more skilful growth and management, it would be impossible to bring together. The *Gold Banksian Medal* was awarded to Mr. Cock of Chiswick; his flowers were Lord Chancellor, Hebe, Emma, Erectum, Symmetry, Sylph, Madame Taglioni, Gipsey, Rachael, Unit, Wizard, and Maid of Honour. The *Silver-Gilt Medal* to Mr. Dobson, gr. to Mr. E. Beck, Isleworth; his collection comprised Flora, Lord Chancellor, Luna, Cleopatra, Leonora, Susanna, Angiola, Favourite, Bella, Matilda, Dido, and Sir R. Peel; these were admirably grown, and bloomed in slate pots. The *Large Silver Medal* was given to Mr. Stains for Ivanhoe, Jubilee, Lady Sale, Queen of the Fairies, Fair Maid of Devon, Superbum, Hebe, Rising Sun, Coronation, Enchantress, Duchess of Sutherland, Priory Queen. From Amateurs there were two collections of 12 varieties in pots of 12 to a cast; the one receiving the Silver Gilt Medal was from Mr. Cock of Chiswick, for 12 finely-grown plants; Lord Chancellor, Nestor, Eclipse, Cyrus, Queen of Fairies, Sylph, Tasso, Jubilee, Madeline, Juliet, Emma, Unit. The other collection, receiving the Large Silver Medal, was from Mr. Bell of Chelsea Hospital, and consisted of Mrs. Sterling, Comte de Paris, Sylph, Coronation, Victory, Priory Queen, Lord Mayor, Grand Duke, Climax, Prince Albert, Una, and Maid of Saragossa.—In collections of 12 Pelargoniums of new and first-rate varieties in pots of 24 to the cast, the Silver Gilt Medal was awarded to Mr. Gaines for the Duchess of Sutherland, Lady Prudhoe, Lady Duncan, Vanguard, Augusta, Rising Sun, Lady Sale, Lydia, Ackbar, Coquette, Lady Mildmay, and Imperiale. And in the same class Mr. Catleugh received the Large Silver for Jubilee, Eclipse, Hebe, Camilla, Madeline, Symmetry, Tasso, Unit, Sir R. Peel, Emma, Duchess of Sutherland, and Wizard.

Fuchsias.—The large Silver Medal was awarded to Mr. Cole, gr. to C. Lewis, Esq., Blackheath, for the following 12 varieties of Fuchsias:—Brockmannii, Victorine, Defiance, Stanwellii, Eclipse, Eppsii, Insignis, Majestica, Britannia, Champion, Gem, and Moneypennii; and to Mr. Catleugh, Hans-place, Chelsea, the Silver Knightian was awarded for Victorine, Champion, Splendida, Spectabilis, Majestica, Gem, Decora, Hutchinsoni, Eclipse, Rosea alba, Cormackii and Exoniensis. The specimen of Exoniensis in this collection sets at rest the difference of opinion regarding the habit of the flower; this plant was about 5 ft. high, with branches at regular intervals diminishing in length as they approached the top, and pendent with its beautiful flowers.

The Calceolarias were not so showy as we have been accustomed to see them. There were two collections; the remainder consisted entirely of seedling varieties. The Amateur's collection, to which the large Silver Medal was awarded, was from Mr. Stanley, gr. to H. Berens, Esq., for six well-bloomed specimens—Ariel, Warrior, Sir R. Peel, Fairy Queen, Village Maid, and Compacta. The Nurseryman's collection was from Mr. Gaines, of Battersea, and received the Silver Knightian for Sunbeam, Ackbar, Magnet, Mag. grandiflora, Candidate, Lady of the Lake. The collection from Mr. Standish, of

Bagshot, exhibited not for competition, consisted entirely of seedlings, and comprised many beautiful varieties; they were Sir T. Lawrence, Titian, Celebration, Great Western, Julio, Magna, Claude, Conqueror, Sir R. Sale, Teniers, Guido, and Guercino.

CINERARIAS.—The Silv. Banksian Medal was awarded to Mr. Ivery, of Peckham, for a collection of 12 Cinerarias, which comprised the following sorts:—Regina Victoria, Seedling King of Prussia, Prince of Oldenburgh, True Blue, Pickwick, Emperor, Laura, Nosegay, Eclipse, Triumph, and Pride of Peckham.

The SEEDLING Tent contained but few Pelargoniums; and one only, a seedling of the present year, received a certificate (named Dr. Lindley): this was in Mr. Whome's collection, gr. to E. Foster, Esq., Clewer Manor; the flower is fine in form, with bright, deep rose-coloured under petals, small white centre, with large dark blotch on the upper petals, leaving but a narrow margin of bright rose. Another seedling in this collection attracted much attention; it is a flower rather deficient in form, but possessing extraordinary depth and richness of colour of a peculiar quality; it was regarded with much interest by amateurs, who speculated upon the influence such a flower would have in future upon this favourite class. In Mr. Beck's collection (which was disqualified from the omission of the names), we noticed two fine seedlings, Arabella and splendens; the former a rosy flower with a white centre, the latter a high and brilliant-coloured variety; the other seedlings in this class presented no improvement. A certificate of merit was awarded to Mr. Ivery for a seedling Azalea named formosa, and the same to Mr. Catleugh for a variety named conspicua rosea; both having large flowers, clean and bright in colour, and expanding freely. A few Cinerarias were exhibited, but none that seemed to be improvements upon those that have already appeared. There were a great many seedling Calceolarias, principally varieties, having small blotches covering the front of the flower; these are now become so common, that, unless the form is fine and the marking peculiar, they are difficult to distinguish from each other. From a careful examination of this part of the Exhibition, we thought the best seedling was one from Mr. Kinghorn, named the Duchess of Sutherland. The Fuchsias presented no improvements upon the kinds already in cultivation.

The exhibition of FRUIT, the Pines excepted, was by far the best we ever saw in May. The Grapes, both Black and White, and also the Strawberries and Melons, were as good as could be produced at any season of the year. Two fine baskets of Black Hamburgh Grapes were shown, according to notice, by Mr. Wilmot, of Isleworth; and although they were exceedingly fine, almost as good as could be desired, there were several lots as good from other growers, and one or two baskets considerably better, especially those sent by Mrs. Knott, of East Barnet; these were perfect: fine bunches, large berries, quite ripe, as black as a coal, and beautifully covered with bloom; these were the Black Hamburgh, but some Dutch Sweetwater in the same basket were equally good. Very superior Grapes, both Hamburgh and Sweetwater, were also shown by Mr. Atlee, gr. to H. Beaufoy, Esq., Mr. Dodds, gr. to Sir G. Warrender, Bart., Mr. Wortley, gr. to F. Maubert, Esq., Mr. Braid, gr. to H. Perkins, Esq., Mr. R. Chapman, Mr. J. Davies, of Oakhill, Mr. Spencer, gr. to the Marquess of Lansdowne, Mr. Bell, of Norwich, and Mr. Mitchell, of Brighton. From Messrs. Cridland and Co. were some fine bunches of Black Hamburghs, but they were deficient in colour; and those from Mr. Henderson, gr. to Sir G. Beaumont, Mr. Murray, gr. to the Marquess of Bath, were much injured by being badly packed. In addition to those mentioned above, very good White Grapes were sent by Mr. Gadd, of Betchworth Castle, near Dorking, Mr. Dodds, Mr. Davies of Oakhill, Mr. Mitchell, of Brighton, Mr. M'Lean, gr. to the Marquess of Downshire, and Mr. Brewin, gr. to R. Gunter, Esq.; but the Muscats shown by Mr. Brewin were far from ripe. The only Pines worthy of special remark, in these days of six and seven-pounder Queens, were from Mr. Leslie, gr. to J. Fleming, Esq., and these, though tolerably good for May, were not so good as we have seen exhibited in some seasons by Mr. Dowding. A seedling Pine, apparently a cross between the Queen and Black Jamaica, was sent by Mr. J. Fish, gr. to H. Oddie, Esq.; it was small, but tolerably well swelled. Three kinds of Strawberries, viz. the British Queen, Keen's Seedling and Old Carolina, were sent by Mr. Spencer, and fine dishes of the British Queen, by Mr. R. Kinghorn, gr. to A. Murray, Esq, Mr. W. Davies, of Isleworth, Mr. J. Davies, Mr. Spencer, and Mr. Dodd: all these were very fine, but Mr. Spencer's were the largest. A fine dish of May Duke Cherries was sent by Mr. Ewing, gr. to O. F. Meyrick, Esq., and a small dish not quite ripe from Mr. Dodds. Some beautiful White Currants were sent by Mr. Dodds, and some fine Shaddocks came from the garden of the Viscount Berehaven. Peaches and Nectarines were sent by Mr. Spencer and Mr. Henderson, but neither were very fine. A brace of very excellent Melons called Snow's Hardy Green Flesh, and said to produce two and three crops in a season, were sent by Mr. Snow, gr. to the Earl de Grey; green flesh Melons were also exhibited by Mr. J. Fish, and a brace of Persian Melons by Mr. Spencer. The Cantaloup Melons from Mr. Gadd, of Betchworth Castle, would be considered fine at any season, but for May they were superlatively excellent, and some of them could not have been less than six pounds in weight. Mr. J. Fish sent some Cantaloup Melons, as did also Mr. Spencer. Two good collections of Apples and Pears, in a fine state of preservation, were exhibited by Mr. Baldwin, of Turnham Green, and R. Brook, Esq. There is one hint which the reporter may perhaps be permitted to give the exhibitors of fruit, and that is, to point out the necessity of every kind being properly named. Without this it is impossible to do justice to what is shown, and it will account for the omissions of some names in this report.

BOTANICAL SOCIETY OF LONDON.

May 3.—J. E. Gray, Esq., President, in the Chair. Various donations were announced. Professor Allman, J. T. Mackay, Esq., and T. C. Hunt, Esq., H.M. Consul at the Azores, were elected members.—A specimen of Borkhausia setosa was presented by G. S. Gibson, Esq., which was stated to have been found by Dr. J. B. Wood in corn-fields at Withington, near Manchester.—A specimen of Primula vulgaris, bearing three flowers on a long slender scape, was exhibited from Mr. D. Stock, of Bungay, as an example of the plant usually (though incorrectly) called Primula elatior by the botanists of that part of England. Having been inclosed in a post letter before dried, it was too much shrivelled to admit of its being assigned quite certainly to the variety caulescens of the London Catalogue. The variety intermedia of the same Catalogue usually bears 10 or 20 flowers on a scape, and approximates to the Cowslip in its deep colour and short pubescence.—A monstrosity of Primula vulgaris was also presented by Mr. D. Stock. In this specimen a short peduncle terminated in a funnel-shaped calyx, formed by the adhesion of 15 sepals, and inclosing two distinct corollas; the limb of one corolla being divided into eight lobes, that of the other into seven.—Read, "A Synoptical View of the British Fruticose Rubi, arranged in Groups, with Explanatory Remarks," (Part 2), by Edwin Lees, Esq., F.L.S.

COUNTRY SHOWS.

Alnwick Florists' Show.—The florists of Alnwick held their Annual Exhibition of Auriculas and Polyanthuses on the 7th ult. The flowers exhibited were in fine order, and reflected much credit upon the growers. The prizes were awarded as follows:—*Auriculas*, Green-edged: 1, Page's Champion, Mr. Allan; 2, Empress of Russia, Mr. Cockburn. Grey-edged: 1, Grime's Privateer, Mr. Allan; 2, Grime's Privateer, Mr. Cockburn. White-edged: 1, Leigh's Freight Bonus, Mr. Cockburn. *Self*, Wetherwood's Othello, Mr. Allan. *Alpines*, 1, Queen Adelaide, Mr. Allan; 2, Prince Albert, Mr. Richardson. *Polyanthuses*, 1, Bonny Bess, Mr. Cockburn; 2, George the Fourth, Mr. Allan.

Cork Horticultural Society.—This was the first Exhibition for this season. It took place on Thursday, the 18th of April. The following were the most attractive objects:—From Lord Berehaven, some very fine Shaddocks and Oranges. From J. S. Barry, Esq., a fine specimen of Chorozema varium, and a large Acacia armata, covered with flowers; an Orange-tree, in fruit; and some Hyacinths, &c. The collection from W. M. Reeves, Esq., included a fine specimen of Abutilon striatum, in flower; the sweet-scented Boronia serrulata; several varieties of Cacti, Fuchsia venus victrix; the graceful Tropæolum tricolor, a new variety of Nemophila, and a collection of Mosses.—*Cork Constitution.*

Lancaster Flower Show, May 17.—The Exhibition of TULIPS was remarkably fine, and considered superior to any previous Show. The following prizes were awarded:—TULIPS: 1, Duke of Lancaster, Albion, Black Baqueta, Transparent Noir, Roi de Cerise, Roi de Little, Captain Wilkinson; 2, Defiance, Albion, Bonnefaites, Wurtemberg, Roi de Cerise, Bronti, Mr. Richardson; 3, Duke of Lancaster, Albion, Incomparable Surpassant, Do. Prime Noble, Do. Little, Roi de Cerise, Mr. Walmsley; *Feathered Bizarres*: Duke of Lancaster, Captain Wilkinson; Trafalgar, Mr. Marshall; Duke of Devonshire, Mr. Hargreaves; Duke of Wellington, Trafalgar, Captain Wilkinson; Charles the Tenth, Mr. Richardson; Marshal de Sourbaisse, Mr. Walmsley; Priestman's Seedling, Mr. Hargreaves; Cremoisa, Mr. Hargreaves. *Feathered Bybs.*. Gaystilla, Mr. Hargreaves; Black Baqueta, Mr. Jopson; Victoria, Mr. Richardson; Thompson's Violet, Mr. Hargreaves; Washington, Duchess of Hamilton; Maitre Partout, Mr. Richardson; Violet Rougrete, Mr. Hargreaves; Capt. Flash, Duchess of Hamilton; Incomparable, Mr. Richardson. *Feathered Roses*: Duc de Bronti, Walworth, and Do Little, Mr. Richardson; Triomphe Royale, Mr. Hargreaves; Andromeda, Mr. Walmsley; Holden's Rose and Compte de Vergennes, Duchess of Hamilton; Hero of the Nile, Mr Richardson; Rose Hebe, Duchess of Hamilton. *Flamed Bizarres*: Albion, Captain Wilkinson; Lustre, Mr. Hargreaves; Smith's Alexander, Mr. Richardson; Le Nom, Mr. Richardson; Leopoldina, Captain Wilkinson; Leopold, Mr. Richardson; Liberal, Mr. Richardson; Arcade, Duchess of Hamilton; Grand Cairo, Mr. Hargreaves. *Flamed Byblooms*: Transparent Noir, Capt. Wilkinson; Voire Helme, Mr. Richardson; Pompey's Pillar, Capt. Wilkinson; Wurtemburg, Mr. Richardson; Sable Rex, J. Stout, Esq.; Buckley's Beauty, Violet Wallers, Butler's Louis 16th, Mr. Walmsley. *Flamed Roses*: Roi de Cerise, Mr. Richardson; Lord Hill, Duchess of Hamilton; Unique and Rose Quatre, Mr. Richardson; La Vandiken, Vulcan, and Sanspareil, Mr. Hargreaves; Arbre de Diana, Duchess of Hamilton; Do. Captain Wilkinson. *Best Yellow Tulip*: Mina d'Or, Mr. Hargreaves. *Best Double Tulip*: Marriage de ma Fille, Captain Wilkinson. *Greenhouse Plants*: Tropæolum tricolorum, Cactus Jenkinsonii, and Polygala speciosa, Mr. T. Jopson. *Hardy Plants*: Deutzia scabra, Mr. Bower; Cypripedium spectabile, Miss Eidsforth. *Roses*: Bardon, Mr. Jopson; Queen of Bourbons, Mr. Hargreaves; Yellow Noisette, C. Bower, Esq.; Aubernon, Mrs. Gawthorpe.

The Morningside Practical Gardeners' Society held their first meeting for the season in the new schoolroom, Morningside, on Tuesday the 30th ultimo, when several prizes were awarded. We have only been furnished with a list of rewards, without the names of the flowers for which they were given.

South-Essex Horticultural Society, May 15.—The attendance was equal to that of preceding years. The larger collections were particularly fine, and contained plants many of which would have been considered excellent as single specimens in former years. A variety of prizes were awarded, concerning which we have no details beyond the names of the winners. Several cottagers' prizes were also distributed.

Worcestershire Horticultural Society.—The first Exhibition for the present year took place on Tuesday, and was well attended. Mr. T. Brown sent Azalea indica; Mr. Smith, Azalea Smithii and Fuchsia formosa elegans; Mr. Bennett, Cactus Ackermannii; Mr. Cook, Rosa Devoniensis and a seedling Calceolaria. The prizes were awarded as follows:—*Auriculas*, Green-edged: 1, Page's Champion; 2, Oliver's Lovely Ann; 3, Fletcher's Ne Plus Ultra, Mr. T. Brown. Grey-edged: 1, Conqueror of Europe; 2, Lord of Hallamshire, Mr. T. Brown; 3, Popplewell's Conqueror, Mr. J. Hooper, jun. White-edged: 1, Mrs. Willoughby, Mr. Biddell; 2, Lily of the Valley, Mr. Brown. *Selfs*: 1, Bury's Lord Primate, Mr. T. Brown; 2, Dixon's Apollo, Mr. J. Hooper; 3, Gordon's Stadtholder, Mr. T. Brown. *Alpines*: 1, Brown's Queen; 2, Biddell's Queen Victoria, Mr. T. brown; 3, Fair Rosamond, Mr. J. Hooper. *Polyanthuses*, Dark: 1, Fletcher's Defiance; 2, Manning's Tippoo, Mr. T. Brown. Red: 1, Seedling, Prince Albert, Mr. T. Burlingham; 2, Bullock's Lancer, Mr. T. Brown. *Hyacinths*, Double red: 1, Mr. Biddell; 2, Mr. T. Burlingham. Blue: 1, Mr. Wood; 2, Mr. Biddell. White: 1, Mr. J. Hooper; 2, Mr. T. Burlingham. Single blue: 1, Mr. T. Burlingham. White: 1, Mr. J. Hooper. *Calceolarias*, 1, Seedling, Victoria, Mr. T. Burlingham; 2, Mr. Cook. *Stove Plants*: 1, Cactus Ackermannii; 2, Cactus Mellisonii, Mr. Cook; 3, Euphorbia splendens, Mr. Smith; 4, Cactus flagelliformis, Mr. Cook. *Greenhouse Plants*: 1, Azalea indica, Mr. R. Smith; 2, A. Smithii, Mr. Bennett; 3, Diosma purpurea, Mr. Wood; 4, Fuchsia formosa elegans, Mr. Bennett. *Pelargoniums*: 1, Climax; 2, Jewess, G. J. A. Walker, Esq. *Heaths* 1, Erica delecta; 2, E. Hartnelli, Mr. Stanton. *Hardy Shrubs*: 1 Rosa Devoniensis, Mr. T. Burlingham; 2, Erica australis, Mr. Wood. *Herbaceous Plants*: 1, Cineraria grandis; 2, C. Irbyana, Mr. Bennett. EXTRA PRIZES were given for *Azalea indica alba*, to Mr. Bennett; for *Erica inflata*, to Mr. Smith; for *Verbena Princess Royal*, to Mr. Cook.—*Worcester Herald.*

Reviews.

Species Filicum; being Descriptions of all known Ferns. Illustrated with Plates. By Sir W. J. Hooker, K.H., F.R.S., &c. 8vo. Pamplin. Part II.

IT is extremely satisfactory to find this important work duly published at its allotted time, and executed with all the skill and taste of its predecessor. The Number before us contains the genera Dicksonia, including Balantium, Culcita, Leptopleuria, Cystodium, Patania, and Sitolobium—which Sir W. Hooker does not consider sufficiently distinct—Cibotium, Loxsoma, and the great mass of species included under the names of Hymenophyllum and Trichomanes. The next Part will appear in July.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

BARBACENIA SQUAMATA. Scaly Barbacenia. (*Herbaceous perennial.*) Bromeliaceæ. Hexandria Monogynia.—For the introduction of this plant cultivators are indebted to the enterprising zeal of Messrs. Veitch and Sons, of Exeter, whose collector, Mr. Lobb, forwarded seeds from Brazil, in 1841, from which a number of plants have been raised, which have flowered in the valuable collection of those gentlemen during the spring of the present year. The genus Barbacenia has been long known to the admirers of plants through the B. purpurea, another Brazilian species of considerable merit; and through the more recently introduced B. gracilis. Besides the present, these are the only species which have been received in England. Twelve species are mentioned by Martius in his "Plantarum Braziliensis;" and engravings and descriptions of six are furnished in the same work, all of which are different from the three above mentioned. They were found growing on arid situations on mountains, at an elevation of from 1000 to 1500 feet, and only between the 14th and 23d degrees of latitude. One of those species, B. tricolor, apparently bears a strong resemblance to this, but is a dwarfer plant, and essentially distinct in specific character. The leaves are shorter than the scape, and the flowers, instead of having the inside of the petals of a deeper colour than the outer, are just reversed. Most of the species—and amongst them the present must be enumerated—have long narrow leaves collected on a short stem into a tuft, and when without their flowers have an appearance resembling some of our mountain sedges. Few plants are able to bear the want of water for a longer period without sustaining injury. And, except during the period of the most active growth, much moisture appears to be inimical to their welfare. It ought to be sparingly applied at all other seasons, and, even then, it will be necessary to use it cautiously. The soil must be well drained, so that no superfluous moisture may stagnate about the roots. After they have completed their growth, they must be preserved as free from wet as possible. To induce them to develope an abundance of bloom, a dry and cool situation is indispensable during the latter part of summer and throughout the winter. On the approach of spring they must be removed to a warm and humid stove, or placed in a pit with a steady bottom-heat. In stoves, where there is the convenience of rockwork, they may be planted along the front, or in some part where they will not be far removed from the eye. But it is as a pot-plant that it appears most likely to succeed best. Propagation will probably be attended with difficulty unless seed can be matured, and we are not aware that any has yet ripened. The generic name was given by Vandelli, in honour of Barbacena, a governor of Minas Geraes, in Brazil.—*Paxton's Magazine of Botany.*

PHLOMIS CASHMERIANA. Cashmere Phlomis. (*Hardy Perennial.*) Labiatæ. Didynamia Gymnospermia.—To those who possess no greenhouse, this good-looking plant, from the valley of Cashmere, will be welcome; for its large, pale-lilac flowers remain for a considerable time in beauty. It is a hardy perennial plant, growing about two feet high, and flowering in July and August. It requires a rich, light soil, and a situation which is rather dry in winter. It is increased, when the plants are old, by dividing the roots in spring, or from seeds; but it grows slowly when young, and will not flower before the second year after the seed is sown. It was raised in the gardens of the Horticultural Society, from seeds received from Dr. Royle.—*Botanical Register.*

Garden Memoranda.

Messrs. Lowes, Clapton.—In the first house a handsome hybrid Rhododendron, with cream-coloured blossoms copiously dotted with yellowish green on the upper segments, is a conspicuous object. The flowers are large, and I counted between 30 and 40 in one truss. Several plants of the old Eutaxia myrtifolia, a handsome New Holland plant, were flowering profusely, together with specimens of Boronia serrulata, with its lovely starry pink blossoms on the tips of the branches, Platylobium parviflorum, with an abundance of yellow flowers, and a seedling variety of Azalea indica, called Woodsii, laden with large rich purple flowers, that were beautifully spotted. The atmosphere was agreeably scented from a number of 10-week Stocks in pots. The house adjoining contained specimens of Platylobium Murrayanum and Chorozema Dicksoni—the latter the handsomest species of its class; the graceful C. cordatum macrophyllum, with orange and purple flowers; Leschenaultia biloba, bearing a profusion of azure blossoms; and Anthocercis viscosa, with large white flowers, having the inside of the corolla tube streaked with numerous green lines. In the house

appropriated to the cultivation of Cape Heaths were a number of excellent specimens of the different varieties of Erica ventricosa, a species possessing a superior habit, and protruding large tubular and lively flowers in profusion; the small but extremely neat-flowering and delicious-scented E. fragrans; the compact-growing and free-flowering E. perspicua; the strong robust E. elegans, with large pink bracts and calyx, and a globular corolla, of the same pleasing hue, tipped with green; E. cistifolia, with ciliated leaves and terminal clusters of small white campanulate flowers, expanding wide enough to show the black anthers which almost fill up the area; E. pinea, a species with bright purple flowers and dense foliage; small plants of E. mundula, and the almost ever-flowering E. mutabilis. Many of the larger specimens, and some of the less delicate smaller ones, have been removed to a shady situation in the open air. A stove devoted to that beautiful tribe of plants, Exotic Ferns, contains a thriving collection: many of the more vigorous-growing species having received a large shift are producing noble fronds. Among the more rare species, the following are distinguished as much for their elegance as their scarcity:—Cheilanthes micropteris, Pteris ternifolia, and P. rotundifolia, a handsome species from New Zealand; Cibotia Schiedii, one of the Tree Ferns, and Cœnopteris japonica. The chief art in the cultivation of this tribe appears to be vested in the regulation of atmospherical moisture, and the maintenance of a diffused light, and at the same time providing against a saturated soil, by securing ample drainage. The generality of Ferns never succeed well exposed to the direct rays of the sun, or in an arid atmosphere. Few of the species require a great bulk of soil, but succeed better when grown in a shallow layer, if the roots have room to spread near the surface; therefore, when planted in large pots, one-half the depth or more ought to be potsherds, or some similar porous material. Mr. Lowe has got a plant of Franciscea hydrangeiformis, a new species that has not yet flowered; also Gardenia Sherbournia, and a new kind of Stephanotus, bearing great resemblance to S. floribundus, but apparently slightly different in foliage: it has not yet produced blossoms. Two or three plants of Wistaria chinensis, which have been planted in the open ground for the purpose of propagation by layers, are flowering with great freedom, and are particularly attractive, notwithstanding the usual pendent position of the racemes. These fully testify the perfect hardiness of the species, as they have received no protection whatever. Vinca herbacea, a useful plant for rockwork, is trailing over a pile of stones at the end of one of the conservatories, and displaying its pretty blue blossoms.—*Q.*

Miscellaneous.

Potato Moulding.—A few years since, I stated the results of experiments I had then for several years made, in order to ascertain the utility or otherwise of the system so universally practised of moulding Potatoes; and if I was then partly convinced of the inutility, if not injury, of moulding, that conviction is now fully confirmed, after ten years' experience on a soil of mediocrity, neither wet nor dry, rich nor poor. I then stated to this effect:—"I am at a loss to know, why ridge up the rows like the roof of a building, the leaves acting as tiles, assisting to throw the genial summer showers off into the furrows, where it cannot benefit the plants, being below the spongioles, or roots?" Piling up the earth thus, causing the production of other roots, and throwing those already formed below out of office, and thereby unnecessarily exhausting the plants, much time is thus lost, and Nature plainly indicates the error of very deep planting or moulding, which, together with hoeing, is generally left so long that many of the tender succulent roots are broken, to the serious injury of the crop. Thus, in the culture of this most essential root, the result of my experience induces me to conclude the moulding a loss of time, and a decided injury to the crop, which to the poor man, for whose benefit principally I write, certainly is an object. I leave the land level, allowing the roots to extend on all sides within the influence of sun and air. I plant the tubers whole, a little deeper than is generally done, forking the soil for a time (the spade being improper for that purpose), and the weeds of course are kept down.—*Wm. Godsall, in the Hereford Times.*

Grafting Coniferous Plants.—The proper time for grafting these is when the young shoots have made about three-fourths of their length, and are still so herbaceous as to break like a shoot of Asparagus. The shoot of the stock is then broken off about 2 inches under its terminating bud; the leaves are stripped off from 20 to 24 lines down from the extremity; leaving, however, two pairs of leaves opposite, and close to the section of fracture, which leaves are of great importance. The shoot is then split with a very thin knife, between the two pairs of leaves, and to the depth of 2 inches; the scion is then prepared; the lower part being stripped of its leaves to the length of 2 inches, is cut, and inserted in the usual manner of cleft-grafting. They may be grafted, also, in the lateral manner. The graft is tied with a slip of woollen, and a cap of paper is put over the whole, to protect it from the sun and rain. At the end of 15 days this cap is removed, and the ligature at the end of a month; at that time, also, the two pairs of leaves, which have served as nurses, are removed. The scions of those sorts of Pines which make two growths in a season, or, as the technical phrase is, have a second sap, produce a shoot of 5 or 6 inches the first year; but those of only one sap, as the Corsican Pine, Weymouth Pine, &c., merely ripen the wood grown before grafting, and form a strong terminating bud, which in the following year produces a shoot of 15 inches or 2 feet in length.—*Loudon's Arboretum Britannicum*, vol. iv., p. 2130.

Peas.—Mr. Shilling has sent us specimens of his New Early Grotto Pea, which were gathered on the 20th ult. He states that these were produced from seed sown in the open ground on the 25th of last November. Judging from the specimens sent, this is a fine large, good-looking Pea, and will, no doubt, be found to be a very useful early variety.

The Late Mr. Loudon.—George Charlwood, Esq., of Covent Garden, London, has offered as a prize, at the forthcoming Grand Horticultural Exhibition, to be held at Bromley, Kent, a copy of the late Mr. Loudon's celebrated botanical work, the "Arboretum Britannicum," value ten pounds, for the best collection of plants that may be there exhibited. We are glad to see that a beginning has been made in offering Mr. Loudon's works as prizes for competition at botanical exhibitions. It is a plan of aiding the subscription for the assistance of the late estimable Mr. Loudon's family, that has often been urged on the attention of Floral Societies, but hitherto they have been heedless of all appeals of this sort. Better things might have been expected from persons pretending to have a love of gardening, and to be actuated by the feelings of benevolence which the beauties of Floral Nature are capable of inspiring in well-regulated minds. It is a sordid and debasing craving for "gold and silver medals" that has hitherto prevented this plan from being generally adopted, to a certain extent, in all Floral Societies; but it is to be hoped committees of management (who ought to be above such avaricious considerations) will at once act in the matter without reference to the wishes of (mercenary) exhibitors. What can be considered so honourable as to win a prize of one of Mr. Loudon's works offered under the circumstances of providing a competence for the independence of that lamented gentleman's bereaved family? Not any "gold or silver medal," we are certain, by any person who has a true love of the elevating and humanizing science of flower cultivation! Mr. Loudon was the "gardener's friend" in the true and best sense of the term, and his memory has a claim on their regard which cannot be unheeded by those who have any perception of their duty, and principle to perform it. If every Floral Society were to offer, according to their pecuniary means, but one of Mr. Loudon's publications as a prize for competition during the present season, the object of his friends in making an effort to dispose of his publications for the purpose of supplying a competence for the support of his amiable widow and only daughter, would be effectually accomplished, and an obvious duty would be honourably performed. We hope the Societies in this district will adopt the plan suggested, and will have great competition for the prize they offer, or we shall be half ashamed of their principles and notions as regards the true value of a botanical prize. The subject, we are sure, only wants broaching at Floral Meetings to be instantly acted upon, and accompanied with complete success.—*Newcastle Advertiser.*

Orchidaceæ of New Zealand.—As but little is yet known of the Flora of New Zealand, such examples of its vegetation as have been brought to England being, for the most part, of the plants of the Northern island, gathered at the River Thames, and at the Bay of Islands, and adjacent country, in the parallel of 35 deg., we cannot say to what extent Orchidaceous Epiphytes may be distributed on those islands, for absolutely nothing is known of the vegetation of the middle or larger one, beyond what was observed at Dusky Bay, on its west coast, and Queen Charlotte's Sound, at its northern extremity, in the voyages of Cook and Vancouver; but as the Epidendrum autumnale of Forster, which was originally discovered at Dusky Bay in 45¾ lat., is also abundant in humid woods at the Bay of Islands in 35 deg., it is fair to conclude that the intermediate country, stretching through 11 deg. of latitude, is not wanting in other species. I myself, however, met with no other than the plant just named: but it appears, from the report of the Botanical part of the collections formed during the voyage of L'Astrolabe, that Captain D. D'Urville found at a port in New Zealand, to which he has attached the name of the corvette he commanded, Dendrobium biflorum, a plant at that period (1827) only known to exist on the Society's group. Besides the two terrestrial plants found by Forster in New Zealand, my visit to the Northern Island in 1826 brought to light other two plants, of most remarkable Port Jackson genera of Mr. Brown, viz., Pterostylis and Acianthus; and to those the French navigator, D'Urville, has added a fifth, a Diuris, which, however, appears a doubtful species; and as the Work in which it has been published is not free from errors, it may be doubted whether it is indigenous to New Zealand at all, as no particular locality is mentioned. The following is an enumeration of the species thus made known to us:—

1. Thelymitra Forsteri, in dry, open Fern-grounds. Bay of Islands. Wangaroa, &c.; flowering in spring (Sept. and Oct.)—2. Diuris Novæ Zeelandiæ.—3. Microtis Forsteri. In the open timberless tracts, among Fern, Bay of Islands, &c.—4. Acianthus rivularis. In the rocky bed of a rivulet, in a ravine, in the vicinity of Wangaroa Harbour. North Island, on the eastern coast 1826 (flowering in November).—5. Pterostylis Banksii, on the soft alluvial banks of the Kaua-kaua River, Bay of Islands, 1826.

—*Allan Cunningham.* (Extract from an unpublished Letter).

CALENDAR OF OPERATIONS

For the ensuing Week.

I.—HOTHOUSE, CONSERVATORIES, &c.

STOVE-PLANTS now require large portions of air, plenty of room, and as much light as the house will admit, in order to ripen their growth properly. Woody plants and large specimens should not be shaded, if possible; but all the young stock may have some light shading thrown over the glass in the middle of the day, when the sun is strong. Keep the temperature moist, and see that none of the plants suffer from the want of water.

Conservatory.—There are so many plants, and tribes of plants, for keeping the Conservatory gay in summer, that I am at a loss to say which are the best, or what to recommend, except in a general way. I am now visiting the great collections in and near London, and whatever appears to me to be useful information about conservatory plants, I shall mention it in future Calendars. The summer treatment of the Conservatory is so uniform, that I shall have more room for notices of this kind. The grand points to be observed are, never to let the air get very dry, if possible, all the summer; to keep the house as cool as the weather will allow, and to let the plants never be crowded together.

Greenhouse.—A mixed greenhouse is an indifferent place for ripening off the growths of Camellias and Chinese Azaleas, two tribes, whose flowering next year depends on the treatment they receive at this time. Close pits shaded in the middle of the day, and kept moderately moist, suit them best; but large specimens cannot find head-room in these pits; and when these are brought into vineries, or other large houses, where they stand far from the glass, they are better without any shade over them. The greenhouse also requires to be kept moist and cool at night through the summer.—*D. B.*

II.—FLOWER GARDEN AND SHRUBBERIES.

Out-door Department.—Where the planting out of half-hardy plants is completed, the business of the Flower Garden for some time to come will, in a great measure, be merely routine; such as hoeing and raking, tying out and pegging down, removing dead flowers, and keeping everything and every place as it ought to be, clean, neat, and tidy; therefore, lengthened weekly remarks will be unnecessary. Under the protection of a mulching of short Grass, stick a few branches thinly in the beds, and place an inverted pot over the most tender plants; my plants are progressing, though it is certainly but very slowly. The morning of the 18th of May, 1844, will long be remembered by gardeners as one of the most severe on record at that season of the year; at half-past 3 A.M., the plants here were specked with hoar frost, and the thermometer indicated nearly 6° of frost. The young growths on some of the trees are killed, especially in exposed situations, and most assuredly the greater part of my bedding out plants would have been numbered "among the things that were," had they not fortunately been covered up. Newly-planted things, especially where not mulched, will require strict attention as to watering; and where the planting out is not completed, proceed with it as fast as possible, as I find the plants are making root, and therefore will be ready when the rain falls. Where they are admired late in the season, a few more Annuals may be sown for late blooming, and a few may also be kept in pots as "stop-gaps" in case of need.

American Garden.—Remove the flowers and seed-pods as fast as they get shabby, which will add materially to the strength of the plants. Give the beds a good flooding of water, if, unlike my friend R. F. below, you can afford to be so liberal. The pegging or tying out of the plants should be no longer delayed.

Reserve Garden.—Double Wallflowers, Mule Pinks, and some common Dianthuses, Allysums, Phloxes, Perennial Iberises, and many kinds of dwarf Cistus and Helianthemums may be propagated under hand-glasses in a shaded situation, and will be found very useful next spring.—*W. P. A.*

III.—FLORISTS' FLOWERS.

Auriculas.—Keep free from weeds; occasionally watering and stirring the surface. Offsets may be taken off if rooted; place them round the side of the pots, in compost before recommended. *Polyanthuses.*—Where the seed-vessels are swelled, should any decayed floret remain, they must be removed, as they are liable to retain moisture to the detriment of the seed. *Tulips.*—Remove the awning and let the flowers have all the weather; where seed is not required, break off the capsules. Do not neglect the beds because their beauty is over, but remove all weeds as they appear. *Ranunculuses.*—After a shower water between the rows with liquid manure, or with Potter's liquid guano. Do not wet the foliage. *Carnations.*—Unless Carnations are carefully tied, the wind will break or twist off the shoots; worsted is the best material to fasten with. As laterals are thrown out from the sides they may be pinched off in order to strengthen the other flowers. *Pinks.*—Prepare a bed in a shady situation, composed of sandy-peat and leaf-soil, equal parts; cuttings or pipings may be put in under hand-glasses as soon as the Grass is sufficiently firm. *Dahlias.*—Let the stakes be put to the plants as soon as convenient; when delayed much longer the root is often injured by the insertion.—*I. F. W.*

IV.—PINERIES, VINERIES, &c.

Pinery.—Now is a good time to go through the whole stock of succession Pine plants, beginning with the largest sized. Let them be taken out of the pit without tying the leaves, (which often does more harm than good, and the roots examined in rotation, to see if they require shifting. Many of them will be for fruiting in the winter or early spring; these, if the roots are plentiful and strong, should now have their final shift. Follow with the smaller plants, putting them into larger or smaller pots according to their vigour. Some of the old tan will probably require replacing with fresh; but it is requisite to use caution as to the depth of fresh tan at this season, for fear of overheating. If the heat of the old bed is not much below 85°, it will be sufficient to turn it over to the depth of two or three feet. In replacing the plants, observe to keep those most likely to fruit in the autumn by themselves as much as possible, in order that they may be removed without disarranging the whole pit. The plants should now be allowed plenty of room, that they may not be drawn up by one another.

Vineries.—The houses in which Grapes are ripening should be kept at 95° or 100°, with sun, and if allowed to cool down to 70°, or even to 60° by night, so much the better, as it will be more in accordance with what takes place where Grapes ripen well in the natural atmosphere. On nights following clear sunny days no fire will be necessary in any of the vineries. I trust it will not be considered presumption to again caution my brother-gardeners to avoid over-cropping their Vines. I have lately seen sad instances of the bad effects resulting from this worst of all mistakes in the management of the Vine. Continue to keep the roots of the Vines now ripening their crops warm by turning and sprinkling, or, if necessary, renewing the litter on the borders.

Peach house.—The standard trees in pots that have ripened their fruit should be kept in the house till the beginning of June at least, to finish their growth. Give them plenty of water, and syringe once a-day. Should cold cloudy days occur, it would be an advantage to fruit now ripening if a little fire was made in the day-time, and some air given at the back ventilators.

Fig-house.—Let Figs have plenty of air during the day in fine weather, with abundance of water, and, except where fruit is ripening, use the syringe freely.

Cherries.—Spare lights placed now over any Mayduke Cherry-trees against walls in favourable aspects would forward the crop very much, without further trouble than drawing the lights a little apart during sunshine, and pushing them close and closing the ends with canvass during the night.

Melons.—This season has been remarkably favourable for early Melons, and with many these will be ripened and the crop gathered in time to admit of a second set of plants being turned out in the same pit. This is much preferable to obtaining a second crop from the same plants; besides these may be better flavoured kinds than those generally planted for an early crop: they will succeed if planted at any time before the middle of June.—*G. F.*

V.—HARDY FRUIT AND KITCHEN-GARDEN.

Peach trees.—Examine those that suffered from frost last season, and carefully remove every piece of gum and canker with a sharp knife. Prevent all colonising attempts of the green-fly, and see that the roots are not suffering from want of moisture, or much mischief will be produced by a wet autumn. *Cherry-trees.*—Destroy caterpillars and black-fly by squeezing them, and afterwards give a forcible washing to the trees with clear lime-water, or a decoction of the superabundant shoots of those stone fruit-trees which contain Prussic acid, taking care, however, that the decoction is not too strong. *Raspberries.*—After trying many methods of training, I find no system so profitable as keeping the bearing-shoots at a regular distance from each other in a straight row, and tying them to two slight rails. Whatever system of training is adopted, no time should now be lost in removing all those young shoots that will not be required for bearing wood next season.

Celery.—Plant out the first crop, if not already done. If the plants have been pricked out, as recommended, they will require little shading, and no mutilation of their leaves. If, however, you have made your beds or trenches some time since, and have sown the ridges with Peas, the Celery will thrive all the better in consequence. This will be more observable if we have a dry summer. A little guano or superphosphate of lime will cause it to grow more rampant; but to obtain at an early period large and, at the same time, sweet-flavoured heads of Celery, nothing is preferable to a good coating of old hotbed-dung, or rotted tree-leaves. Plant out *Cauliflower*, *Lettuce*, and *Onions*, *Tomatoes* and *Capsicums*, in favourable situations; and *French Beans* that have been forwarded in pots. Sow Turnips, Radishes, Spinach, Peas, Beans, Cauliflowers, Carrots for pulling young, and Onions for salads. Be guided by no kind of directions which advise having two or three crops in a season; but sow and plant often, and but little at a time, if you wish to have a constant supply, no waste, and to hear of no murmurings loud and long from the inmates of the kitchen. *Routine.*—Stake Peas, earth up Potatoes, thin Carrots, and other spring-sown crops; finish the nailing of Figs, regulate the summer shoots of Vines; and, if favourably situated for ripening fruit, train them on the one rod, or rather the long rod system.—*R. F.*

VI.—ARBORICULTURE.

Old Woods.—If it is desirable to manage these well, they should frequently be gone over by a skilful person. Attend to the well-doing and growth of young plants and trees, and see that they are not injured by the overgrowth of other stuff. The commencement of the growing season is the most important time for such work; for to prevent injury is better than cure.

Coppice.—The above observations are as applicable to coppice as to old woods; for spring and summer management is attended with better results, than any winter treatment.

Young Plantations.—Do not neglect to mark the Larch-trees that bear red-flowered cones, which should be left as permanent trees. Attend to the summer-training of young trees and plants, keep down luxuriant weeds, fern, and overgrowth of briers, &c.; cutting off Thistles and Fern when young weakens them greatly, and not unfrequently kills them altogether. The present time is, therefore, the most suitable season for such work. Do not allow any injury to be done through neglect.

Hedge-row Trees should be frequently examined, to see if all is right.

Nursery Work.—Attention to watering, shading, &c., is still necessary. It has been an easy matter to keep down weeds this season. The spring and summer-training of young growing trees and plants must be regularly attended to, where quick and handsome growth is wanted.—*W. B.*

State of the Weather near London for the week ending May 22, 1844, as observed at the Horticultural Garden, Chiswick.

May		Moon's Age.	Barometer Max.	Barometer Min.	Thermometer Max.	Thermometer Min.	Thermometer Mean.	Wind.	Rain.

Average			30.051	29.977	62.1	42.0	52.1		.05

May 17 Light clouds; windy, with slight showers; clear and cold.
— 18 Slight frost, with cold N.E. wind; boisterous, with slight showers; clear and cold.
— 19 Boisterous, dry, cold wind; dusky clouds, with clear intervals.
— 20 Dry and cold throughout; overcast.
— 21 Drizzly; overcast and fine; uniformly overcast at night.
— 22 Dry haze; very fine, overcast with slight haze.
— 23 Cold haze; cloudy and cold; clear at night.

Mean temperature of the week, 2.7 deg. below the average.

ERRATA.—In last week's Table, the Max. of Barom. on the 11th should be 30.060, instead of 33.060; and on the 15th, 30.265, instead of 30.265.

State of the Weather at Chiswick during the last 18 years, for the ensuing Week ending June 1, 1844.

May	Aver. Highest Temp.	Aver. Lowest Temp.	Mean Temp	No. of Years in which it Rained.	Greatest quantity of Rain.	Prevailing Winds. N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.

The highest temperature during the above period occurred on the 27th, 1841—therm. 82°; and the lowest on the 26th, 1836—therm. 38°.

Notices to Correspondents.

MR. PAXTON'S COTTAGER'S CALENDAR.—At the earnest solicitation of many of our Subscribers, we have determined on again reprinting Mr. Paxton's "Cottager's Calendar," in the form of a small volume, for general distribution, price 3*d.* each copy. It may be ordered of all booksellers. Gentlemen wishing to *distribute copies* among their cottage tenantry, may have them *delivered in any part of London*, by remitting a post-office order to this office, at the rate of 5*s.* for every 25 copies.

ANGELICA.—*Q.*—This is a well-known old-fashioned kitchen-garden plant, and what you have appears to be it. It has gone out of general cultivation because other plants are more agreeable to the taste. Besides, it occupies too much space in proportion to its produce. It is, however, still found occasionally in gardens.

BOOKS.—*A Reader.*—Sweet's "Hothouse and Greenhouse Cultivator."——*Ag.*—Knight's "Physiological Papers," a most valuable work, may be had of all booksellers.——*R. S.*—Hooker's "British Flora," Babington's "Manual of British Botany," or Lindley's "Synopsis;" any of these will do.‡——*A Constant Reader.*—The Dean of Manchester has for some time been engaged in examining Iridaceous Plants; but we do not know what his intentions are. The best enumeration of them is in Romer's and Schultes's "Systema Vegetabilium," and a very bad one it is.

CONIFERÆ.—*A Lady.*—Your Stocks are quite old enough for grafting: for the mode of performing the operation see p. 339, of to-day's Paper. ‡

CONSERVATORY PLANTS.—*W. P.*—Good plants for turning out into the beds of a Conservatory are Templetonia glauca, Luculia gratissima, Eutaxia myrtifolia, Pimelea spectabilis, Chorozema varium, Brugmansia sanguinea, Crowea saligna, Cytisus racemosus, Hovea Celsi, together with Camellias, and the different kinds of Acacia, &c. ‡

DAHLIAS.—ΦΙΛΕΑ.—Keyne's Standard of Perfection, Lady St. Maur, Lady Antrobus, Proctor's Nonpareil, Essex Bride, Bourne's Model, Sparey's Aurantia, Brown's Raphael and Rembrandt, and Bushell's Emma.*

DOUBLE TULIP.—*G. L.*—This will make a very pretty border variety; it is cleanly broken, but there is a variety in cultivation similar to it.*

FUCHSIAS.—*B—g.*—*Venus Victrix*, and *Smith's Queen Victoria*, are the only two Fuchsias we remember, that agree with *your* description.*

GRAPES.—*Mediensis.*—By Muscats, according to general acceptation in this country, are understood the White Muscat of Alexandria, and the Red Muscat of Alexandria; the latter is, however, rarely seen. The Royal Muscadine is considered the type of those Grapes to which the term Muscadine is applied. Muscadelles or Muscatelles are names applied to Grapes with obovate berries, imported from Malaga, &c., in the state of Raisins. The Frontignan varieties are sometimes included among the Muscats; but they are better known as Frontignans in this country.‖

HEATING.—*Beginner.*—A very small boiler and pipes will be better than flues for your diminutive greenhouse, but more expensive. Always use four-inch pipes if you can afford them; but it would be quite sufficient to set such a thing as Stephenson's stove inside the house, without any pipes at all. ——*A Subscriber.*—In a very small greenhouse the most economical heating apparatus is a small Stephenson's copper boiler.——*H. T.*—We do not conceive that an Orchidaceous house could be advantageously constructed with Whitneyed calico. It would admit light enough, but it would, we fear, be too cold in winter. For heating, use both a tank for bottom heat and piping for air heat. The smallest boilers that are sold will do.——*J. W. S.*—There is no way of destroying Bindweed except that which you have pursued. If you wage *incessant* war with the leaves, the roots *must* die.

INSECTS.—*W. W.*—The weevil infesting your Pine-trees is the Curculio Pini of Linnæus. It is not uncommon in Fir plantations, especially in Scotland. We should feel obliged by the transmission of a small twig with the buds eaten out as you represent, which would enable us to give the history of this insect. Are not the maggots in the buds? Hand-picking is the only means of reducing its numbers, for it clings so fast that shaking the branches will not dislodge the beetles, it is feared; the best period, probably, to search for them would be by night. *R.*——*B. Chilo's* insect is the caterpillar of the Lackey Moth (Clisiocampa neustria), whose history was given in last year's *Gardeners' Chronicle*, p. 244, and the larva of a lady-bird. We shall be happy to receive any specimens, and to return the names. You are quite correct regarding the rarities which your neighbourhood produces in Natural History. *R.*——*Aliquis.*—Your caterpillar appears to be the larva of Bombyx Caja, the garden tiger-moth. *R* ——*Eileanach.*—The contents of your letter being unprotected, and squeezed perfectly flat, it is impossible to tell you the name or give you any information. *R.*——*F. H. Sankey.*—Your beautiful Oak-galls are the production of a Cynips, whose specific name I am unable to ascertain with certainty. If it be not the C. Quercus pedunculi, I will inform you on my return to town. *R.*——*J. L. Hendon.*—You are right regarding the root-galls of the Elm; they are the work of an insect called Cynips aptera, figured and described in the 1st vol. of this Journal, p. 732.——*W. Martin.*—From your description, it appears to be the caterpillar of the goat-moth (Cossus ligniperda). In vol. 2, fol. and pl. 60, of Curtis's Brit. Ent., you will find its history and coloured figures. *R.*——*A Beginner* must persevere in hand-picking, if he wishes to save his Gooseberries, and he may try the effect of dusting the bushes with Hellebore powder early in the morning. Other effectual means of preventing the ravages occasioned by Nematus trimaculatus were published in vol. 1, p. 548, of this Journal, where its history was illustrated. *R.*

MANURE.—*Beginner.*—Apply liquid manure to plants in pots by pouring it on the soil when it is damp. Soapsuds require no dilution; but it is better to mix them with urine, letting the whole ferment before being employed.——*A. B.*—Water your Vines in pots with any sort of liquid manure, made by bruising sheep's-dung or guano, or any such substances in water, and allowing the fluid to become clear. The stronger it is the less you need use. Weak and often is the best way of using it. Nothing is better for Celery than good rotten dung. You will find directions for killing wood-lice in many previous papers.——*E. R.*—If your manure contained ammonia, as it ought, lime should on no account have been added to it; for the latter expels the former. Lime your garden in the autumn, and apply manure in the spring. ——*A Regular Subscriber.*—We should take a good handful of Potter's guano and strew it over the ground where the roots of the Rose are, and then turn it in with a fork.

NAMES OF PLANTS.—*A Reader.*—We cannot undertake to name Cryptogamic plants, except when they relate to points of cultivation.‡——*M. J. B.*—Bravoa geminiflora.—*Aliquis.*—Irises cannot be named from the roots and leaves alone.——*Zeta.*—All the Lupines are little varieties of L. polyphyllus, of no importance.——*A Devonian.*—The Acacia is determined to be a broad-leaved variety of A. verticillata.——*W. Gardner.*—It is really quite out of the question that we should sit down to name heaps of wild plants. We must beg you to excuse us.——*A. W.*—We can very ill spare the time required in determining dried specimens; but will endeavour to give you an answer next week.——*J. W.*—Cineraria campestris. Your White Veronica Chamædrys must be very pretty.——*W. Mc L.* Ruscus androgynus.——*A. G.*—Acacia juniperina (?) ——*B. T. S.*—1, Melittis Melissophyllum; 2, the purple variety of it, Myosotis versicolor; Euphorbia Paralias.—*J. B.*—Cris-taria multifida.——*Dorsetshire.*—Ulmus montana, not U. cerpinifolia. Thanks.——*E. T. O.*—Epidendrum tripterum; a great rarity. You must apply to the booksellers; we cannot undertake such commissions.——*Z.*—Lathyrus palustris, and some Echium. Viscaria oculata is from 1½ ft. to 2 ft. high. We do not know whether it will bear pegging down.——*C. P. T.*—The Sea Anemone is not a flower, but an animal—a Polype of the genus Actinia.—*Surum.*—Very much crushed; it is hard to say: it looks like a double red Lychnis dioica. ——*A. K.*—A male flower of some gourd. We have no other experience of Humphreys's Compound further than that it is an extremely powerful agent, and requires to be used with great caution, or it kills plants.

PASSIONFLOWERS.—*Z. Q. Q.*—We presume that the reason why your fine healthy free-flowering specimens do not fruit is that their flowers require *setting*. There seems to be no other cause. Potter's liquid guano is highly spoken of, but we have not as yet, ourselves, any positive experience about it.

PELARGONIUMS.—*J. L. Hendon.*—It is impossible to account for such sports as you have sent a specimen of; what you call the defective flower is most probably one of the parents of the variety from which the flowers were cut.*

RHODODENDRONS.—*L. B. R.*—The seeds of these should be sown thinly upon the surface, the soil being previously watered. After sowing, press the seeds down gently to imbed them in the surface, and sprinkle a very little white sand over them, not with the view of covering the seeds, but to make a firmer surface, which future watering will not so easily disturb, and which will, in a great measure, prevent dampness. As a further precaution against damp, keep a potful of sand over a hot flue or pipe, and as soon as the young plants make their appearance sprinkle a little warm sand in among them occasionally whenever they show any indications of dampness. If you will follow this plan you will very likely meet with success. The cause of your seeds not germinating is probably owing to their being covered too deep. ‡

WHITNEY'S COMPOSITION.—*A Beginner.*—The material you sent will do to grow Melons and Cucumbers under; but it will be cheaper to employ calico of a closer texture, as in that case less of the composition will be required to render it waterproof.‡

MISCELLANEOUS.—A subscriber had better change his bookbinder; there is plenty of margin for a *good* binder.——*W. Mc L.*—The story in Darwin about the Upas tree is a romance. The tree is very poisonous certainly, but like the Artocarpeous plants, to which it is related.——*J. H.*—Keep your young Date plant in a bothouse, with a bottom heat of 80°, and it will grow fast. It never fruited in this country. ——*A Subscriber.*—We do not know where the Pelargonium seed is to be had.——*Tyro.*—The Dates sold in shops are the fruit of Phœnix dactylifera.‡——*R. P. L.*—A Pansy-flower like the one you have sent, to ascertain its name, is not worth growing.*——*Erica.*—We are not aware that any Society in London awards a prize for a collection of wild flowers, painted from nature.

SEEDLING FLORISTS' FLOWERS.

CALCEOLARIAS.—*A. Z.*—Your seedling is a very pretty spotted variety, but we have already several in the same way.*——*B.*—Nos. 1, 2, and 4 are good Selfs—large and well formed; 3, white ground with maroon blotch, leaving off abruptly, is a good and showy variety; 5, very large, but deficient in form; 6, a very good mottled flower, in the way of Lady Constable.*——*L. and M.*—No. 1 is a large, brilliant, and very handsome flower, the best of its kind we have seen. No. 2 is singularly marked, but the irregularity at the bottom of the flower is too great.*——*C. L. and S.*—There are two flowers with No. 5 attached, one with brown blotches upon a yellow ground, the other dots and blotches upon a light buff ground; the former is the better flower of the two; 3, buff ground, with dark maroon blotches, decidedly worth keeping; 2 and 6 are too small; 4 and 7 are varieties similar to sorts raised some years since.*——*R. C.*—Your three seedlings are extremely good varieties—good in form and fine in texture, and having the large blotch in front of the flower very decided; they will be very attractive when grown as specimen plants.* ——*R. G.*—Spotted varieties are now very common, so that unless the spots are large or peculiar in form or colour, they are not objects of attraction; your kinds are very common.* ——*An Old Subscriber.*—Your seedling, the *Wonder of the World*, too much resembles Lady Constable, nor is it so large as many specimens we have seen of that favourite variety.* ——*Hector.*—No. 3 is a very common flower; 1, 2, and 4 are varieties better worth preserving; 2 is a fine form, but the spot softens off too much; the spotted kinds are both good, but not uncommon.*——*Anon.*—Your spotted seedling is too small.*——*J. M. H.*—The best seedlings in your collection are Nos. 3, 5, 10, 12, 14; the colours are clearer, and the form of the flowers superior to the others. The five mentioned are very pleasing varieties.*——*P. K.*—Nos. 1, 2, and 3 are your best seedlings with the dark Self; the other varieties are common. They are very small compared to those we are in the habit of seeing.*——*D. B.*—There is too great a similarity in your seedlings, and generally they are not of a good form. No. 7 is the best, but we have seen many like it. They are not equal to the present race of Calceolarias.*——*H. T.*—45 and 46 are your best seedlings; 44 is showy, but not a good form; 43 wants size; 47, bad form; 48, very pretty, but not uncommon.*

CINERARIAS.—*J. M. H.*—No. 1 is the prettiest and most novel of your seedlings, and the best-formed flower; 3 we already possess, with much larger blossoms; 2 and 4 are very common.*

FUCHSIAS.—*Testis.*—There is nothing uncommon in your seedling No. 30, and the corolla wants colour and substance.*—— *J. M. H.*—Your seedling is a very stout flower with good foliage; the sepals are rather coarse. It is of medium quality, being inferior to our best varieties, and superior to many now cultivated; much depends upon its habit.*——*M. D. T.* —Cuttings taken from a branch bearing double flowers, will most probably make your variety permanent. It does not bear comparison with a single flower; the sepals and corolla are very feeble.*

PANSIES.—*R. P. L.*—Your seedlings were in a very dried state when they arrived; the lighter variety is the better of the two; they are rather small and deficient in substance.*

PELARGONIUMS.—*J. S.*—Your seedling is large, but it possesses none of the properties of a fine flower.*——*A Devonian.*—None of your seedlings can be considered improvements upon the varieties already in cultivation; they all appear to lose their proper form when fully expanded. In No. 1 the three lower petals are good, but the upper ones are crumpled and too high. In No. 2, which is very showy, the top petals are too high, and the lower ones narrow, and with a disposition to curl back; 3 is very common; 4 is pretty, but out of form when fully open; 5 is very pretty, but requiring broader under petals; 6 wants form.*——*A Young Beginner.*—The petals of your flower are all too long, and they are also so deficient in substance that the flower cannot retain its form when fully expanded; the spot is bad, being composed too much of lines.*——*J. S.*—"Helen" is an improvement upon the flower previously sent; the under petals are delicate in colour, and well formed; there are too many lines in the upper petals, and the flower altogether is deficient in substance.

PETUNIAS.—*B. B.*—Your lilac variety with green centre is very pretty, and decidedly the better flower of the two; it is well formed, and the surface smooth, and even the lighter variety is not uncommon.*

*** As usual, many communications have been received too late.

YORKSHIRE LAND-DRAINING ASSOCIATION. Capital, 500,000*l.*, in Stock of 25*l.* Deposit 5 per Cent.—The Provisional Committee have determined to limit the time for receiving Applications for Stock in this Association to THURSDAY, the 30th instant, on which day the List will be closed, preparatory to the allotment being made. Prospectuses may be obtained from the Solicitors, Messrs. Blanchard, Richardson, and Gutch, York; or from the Secretary, J. H. CHARNOCK, Wakefield.—May 16, 1844.

CLEAR WHITE GLASS MILK-PANS.

APSLEY PELLATT, FALCON GLASS WORKS, Holland-street, Blackfriars-road, having made further experiments, is able to reduce the price of the Milk-Pans—as described in the *Gardeners' Chronicle*, of clear white flint glass, which is far superior to the foreign green glass—to 5*s.* 6*d.* each, or 3*l.* per dozen.

WE referred the other week to the meeting which was lately held at Cirencester, for the promotion of AGRICULTURAL EDUCATION. The efforts of the Cirencester Farmers' Club have been directed—most praiseworthily directed—to the attainment of a scientific and practical agricultural education for *farmers' sons*; but we must not forget, when speaking of education for the agricultural classes, that farmers' sons are not the only parties to be referred to: the labourers constitute by far the most numerous portion of those classes, and the education of *their* children is matter of as vast a personal and national importance as is the education of those under whom they are to live.

A difficulty, independently of what arises from the fact that, as soon as they are able, they are required to contribute by their labour to their own support, has often been suggested as existing in the way of educating the children of the labouring classes,—and that is, the absolute necessity which is said to exist for accustoming them to labour at an early age, in order that they may acquire the strength and aptitude for work which it is said those never acquire who do not commence a life of labour till they have grown up. Now, though this remark sounds very ungraciously, there is, we believe, a great deal of truth in it: it must be read, not as if it emanated from a hard master, anxious or at least active to make free labour amount to something as like slavery as may be, but as if it came—for it most consistently might come, from a real friend of the workman—one anxious to enable him to get through the line of life to which he is called with as much ease and happiness to himself as possible. It is understood that this difficulty has been experienced to a considerable extent in many districts of Scotland, which as a whole is certainly a better educated country than most counties of England. The difficulty in these instances has been partially overcome by the parish schoolmaster (every parish there has an endowed school), opening a class for farm-servants in the winter evenings; and this class is generally eagerly attended by them, in order that they may make up previous deficiencies.

It appears, then, that the kind of education wanted for the labouring classes is such as combines the usual elements with that which may fit them for their situation in life; just, in fact, such an education, relatively speaking, as is wanted for the sons of farmers. The complaint on *their* account, as stated at the Cirencester meeting by the Earl of Ducie, is, that though at the present schools they learn, no doubt, much that is useful, yet it is not specially so in reference to the line of life to which they are destined. So with agricultural labourers: they have access, on terms generally within their reach, to schools at which they can learn what is certainly most useful; but they cannot learn there that which is necessary to fit them for their occupation through life.

Now, we have made these observations for the purpose of bringing more prominently under the notice of our readers a system of schools which has been established by a most benevolent landowner in the county of Sussex. In these schools not only is this additional—and, if we may make so humble a use of the term—*professional* education offered, but the labour of the children, as they are acquiring the habit of usefully applying it, is turned to account by the schoolmaster, so that it is made to cheapen—in fact, almost to purchase—the knowledge of the usual elements of education, which, during one-half of school-time, they are being taught. These public institutions thus well earn the title which is given them of "*Self-supporting Industrial* Schools." We cannot do better than quote from an excellent article in the *Sussex Advertiser*, the following account of a visit to the Self-supporting Industrial Schools established at Willingdon and Eastdean, near Eastbourne. The writer first states the principle on which claim is laid to this title, viz.:—"That the industrial occupation of a few hours in the afternoon upon land, will nearly or entirely discharge the cost of the school-tuition of a given number of pupils, and superadd a branch of instruction not less valuable to the scholars.

"The WILLINGDON SELF-SUPPORTING SCHOOL is a neat little cottage building, combining, in a very small compass, the attributes of dwelling-house, school, dairy, cowhouse, with thrashing floor above, and various conveniences attached. The roof is surrounded by gutters, that convey the rain-water into a large tank, so that it is not only not wasted, but prevented from running away on the land. The cow-house, piggeries, &c., are so constructed, that all the liquid manure runs into a large tank, sunk in the ground and carefully covered over, so as to allow no rain or water to enter. Our visit was made at half-past one, in ignorance of the hours of the school, which we afterwards found to be from nine till twelve—the afternoon work commencing at two, and continuing till five. We first entered the cow-house, where we discovered two little fellows about seven years of age, waiting to go to work. Their proper hour was two o'clock, but there they were, spade in hand, ready for their afternoon's work. These children were the picture of strong and ruddy health and of thorough cheerfulness, and certainly quite reversed the usual order of things by the evident alacrity with which they came to their work before their proper time. They were shortly joined by some more playmates, for though it was work, in one sense, it certainly was not in another, and they proceeded in a body and commenced digging on the ground allotted for their afternoon's employment. On questioning them we found that there was only one boy above nine years old, and he was the eldest son of the master. There were about a dozen children in all, and they were chiefly under eight, one even being but four years of age. We were then joined by the master himself, who, after putting his little band to work, readily replied to several inquiries which we put as to the rent he paid, the proceeds of his little farm, and the various circumstances connected with it. He stated his position to be as follows:—He rents five acres of land, for which, including the house, he has paid 25*l.* a-year; and which latter he reckons at 10*l.* He cultivates this land by the help of his little scholars, who barter their labour of three hours in the afternoon for three hours of his instruction in the morning, they paying him in addition one penny a-week. He finds himself able to cultivate these five acres thoroughly, and to a good profit; to prove which, he took us into the school-room, where he produced his accounts for the previous year. He has no other source of income than that which he derives from this and from the weekly pence of his scholars. He is perfectly happy, and is able to earn a good living off these five acres for himself, wife, and children. These are his comforts; and now let us see how his little scholars fare as to their share of the bargain, and whether they get efficient instruction in return for their labour. We examined their writing and their arithmetic books, and we may honestly state that some of their work would shame the attainments of many children of the same age in a much higher walk of life. It seems that these children are rarely with him after 11 or 12 years of age, for they have been so well trained in agricultural matters that they very readily find situations at that age with the farmers in the neighbourhood. They appear fond of their master, and their fondness for their employment is sufficiently evidenced by their alacrity in coming to their work before instead of at the time appointed."

This appears in every respect worthy of being imitated in country districts: and we submit it to the clergymen of rural parishes, that great good might be done by the establishment of such schools in their villages. We need only add, that should any one be anxious to inquire further into this subject, we shall be most happy to put him in the way of gaining every information.

IT has been suggested that our last week's remarks on air as a source of VEGETABLE FOOD are liable to misconstruction by some of our readers. It is unquestionably true, as was then stated, that the greater part of the solid substance of every plant is obtained by the decomposition of carbonic acid, which is taken from the air by means of its leaves, as well as from the soil by its roots. The farmer must not, however, on that account think that scientific men believe his manuring the ground to be of comparatively little importance to the crop he cultivates. If any one should be found wild enough to insist upon this, he might be referred to an overwhelming amount of evidence against him as to *the facts* of the matter; and if scientific men generally thought so, their statements would undoubtedly be unworthy of a moment's consideration from the practical farmer; but no: science acknowledges the benefit of manuring land as much as practice experiences it.

Carbon is not the only component part of vegetables—earthy matters exist in plants; whence, otherwise, do Grass-fed sheep and oxen obtain the substance of their bones? These earthy matters perform a part in the vegetable, doubtless as essential as that which they perform in the animal economy; and if plants are expected to grow vigorously, the food supplied to them must contain all those substances which every part requires. Farmyard manures, guano, &c., contain these substances, and hence their value and influence as fertilisers.

That part of the food of a vegetable which enters at its root from the soil is as essential to the healthy growth of the plant as that which enters it by its leaves from the air.

To continue our remarks on the THE ENTRY CLAUSES OF AGRICULTURAL LEASES:—We promised to consider the subject in connection with the capital required by the farmer. The system advocated in our last article on this subject, was that which renders it the interest of the out-going tenant to preserve the fertility of the land unimpaired up to the termination of his tenancy, by securing for him full and fair value of all his property in the land. Give him full value for his straw and his manure, &c., and he will keep the land in good heart, so as to grow bulky crops. His successor will require, in the long-run, but very little more capital than if he had entered on a farm without being required to pay the tenant anything for what he may have left behind him. In the latter case, knowing that nothing will be received for straw, manure, &c., care will have been taken so to run out the land, as far as the lease would permit, that there is but little produce for the in-coming tenant to receive, and still less is there for him of that staple, or heart in the soil, which is far more easily lost than acquired; for this, too, was converted into marketable produce before the expiration of the lease.

All this has been done by the out-going tenant in perfect justice to himself, but with great injury to his landlord, to his successor, and especially to the nation at large. His land will not attain its standard of fertility for several years, and its owner must consent to a rental, smaller on that account than he would otherwise have received; and the tenant of it must submit to several years of gradual outlay before receiving the profits he has a right to expect from it: the sum he lays out amounts ultimately, probably to more than he would have spent had he handed it over at once to his predecessor for cultivation, &c. in the land, when he entered upon it, and then these years of unprofitable outlay would have been as profitable as any of the years of his tenancy; and the fertility of the land under this faulty system is, as we pointed out in a former article, subject to periodical failures—for four years at the beginning, and for four years at the end of each lease it is only in a half-cultivated state, for during the one period it is emerging from, and in the other sinking into a state of comparative sterility; and unquestionably this is a state of things nationally injurious, converting it into a question of space instead of time; and supposing the average duration of a lease to be 14 years, it is as if 8 out of every 14 acres in the country were but half cultivated.

But to return to the bearings of this subject on the amount of capital required by the farmer, and see what effect the system of paying the out-going tenant a full value for all his produce and cultivation in the land has on the purse of his successor:—

We are happy to publish the following account of an instance which has occurred this spring on a farm situated in one of the western counties of England, in which the arrangements between the outgoing tenant and his successor have been conducted on this principle by their representatives, who are experienced farmers—not professional valuers. The farm consists of 240 acres of arable, and about 30 acres of pasture-land, including roads, buildings, &c. The out-going tenant, as in the case specified some weeks ago by "A Farmer and Land-valuer," left the farm unexpectedly, and it was in the highest possible state of cultivation. The articles in the inventory, as it was put into the hands of the valuers, were classified as follows:—

a. Working cattle, harness, &c.
b. Live-stock.
c. Implements.

A portion of the stock under each of these heads was left to the in-coming tenant, at a valuation, as agreed upon between him and his predecessor.

d. Labour and cultivation of fallows and young Wheat.

e. Manure yarded up, &c.

None of the roots were consumed on the land, or a valuation of the manure left there in that way would have been required also.

f. Such portion of the labour and cultivation of the fallow or green crop of the previous year, as may be supposed to remain in the soil unexhausted, for the benefit of the young grain-crops now on the land. This was put at one-half.

g. The unconsumed portion of the out-going tenant's roots and straw.

The following is the valuation of the articles thus classified :—

		£	s.	d.
a. Working Cattle:—1 riding mare, 4 horses, and harness		85	4	6
b. Live Stock:—118 ewes with lambs, and in lamb, and 1 ram	£ 205 0 0			
2 Cows	24 0 0			
Sows and pigs, and 1 boar	33 12 0			
Fowls	2 8 0			
		265	0	0
c. Implements, viz :—3 ploughs, 3 carts, water-cart, rollers, harrows, subsoil plough, horse-hoes, sowing machine, potato-washers and steamer, turnip-cutters, cake-crusher, troughs, hurdles, &c., &c.		171	3	6
d. Cultivation of Wheat, fallows, &c.:—123 acres of Wheat cultivated as follows:—				
Ploughings, amounting to 109½ acres once ploughed, at 8*s.*	£ 43 16 0			
Cultivatings, amounting to 33 acres once cultivated, at 1*s.* 8*d.*	2 15 0			
Harrowings, amounting to 358 acres once harrowed, at 8*d.*	11 18 8			
123 acres drilled, at 2*s.*	12 6 0			
175½ bushels of seed Wheat, at 8*s.*	70 4 0			
Fallow ploughings, amounting to 124 acres once ploughed, at 8*s.*	49 12 0			
37½ acres of young Clover, the seed for which cost, as per bills	16 0 0			
		206	11	8
e. Manures:—In heaps in the fields and yards, 2343 cubic yards, at 3*s.**	336 9 0			
Dung dropped last year on 30 acres of Clover depastured, and 4 acres of Vetches fed off	36 0 0			
		372	9	0
Half-cultivation of the previous year's green crops:—86 acres of roots, at £3 13*s.* 2*d.*		314	12	4
The whole expense of cultivation per acre was estimated as follows:—				
3 ploughings, at 8*s.*	1 4 0			
4 harrowings, at 8*d.*	0 2 8			
1 rolling	0 0 8			
Ridging up	0 4 0			
Sowing	0 1 0			
3 horse-hoeings	0 3 0			
2 hand-hoeings	0 6 0			
30 yards manure, at 3*s.* 6*d.*	5 5 0			
	£7 6 4			
g. Straw, roots, &c., left by the outgoing tenant:—				
35 tons of Carrots, at 15*s.*	26 5 0			
70 tons of Mangold Wurzel, at 10*s.*	35 0 0			
25 tons of straw, as per lease	25 0 0			
15 tons of straw unconsumed, at 30*s.*	22 10 0			
		108	15	0
	£1523	16	0	

This, with additions for certain articles of household furniture, &c., was the sum to which the valuation of the inventory amounted. The amount of capital required for the cultivation of this farm will be ascertained by adding to this the sum required for the payment of labour, and for the purchase of additional live-stock and implements.

The following are the particulars of these additional branches of outlay, as estimated by the in-coming tenant:—

		£	s.	d.
a. 5 *horses and harness*, 160*l*, making the whole amount of the tenant's capital under this head		245	4	6
brief *ewes and lambs*, to help to stock the Clover field, 140*l.*; 250 lbs and one-shear sheep, to be bought in September and October, 375*l.*; 30 head of oxen to be bought in October, 450*l.*; making the whole amount of farmer's capital under this head		1135	0	0
c. 3 carts, 1 plough, 5 frames of harvest carts, harrows, horse-hoes, &c., say 70*l.*, making the sums under this head amount to		241	3	6
d. Cultivation, &c:—Half a year's expenses, horse account, wages, &c., including Wheat and Turnip-hoeing, harvest work, &c, 500*l.*, making the capital under this head amount to		706	11	8
e. Manures:—A purchase of artificial manures will be required, equal in value to 5 tons of guano, say 50*l.*, making this branch of the farmer's capital amount to		427	9	0
f. Half Cultivation of the previous year's green crops		314	12	4
The half-year's rent and taxes due at Michaelmas are not paid out of capital, the farm being supposed to have produced that amount, but not more, by sales, before that time.				
The total capital required by the farmer in this instance thus amounts to		£3065	1	0
This sum is about 11*l.* 7*s.* per acre over the farm.				

There are a great many interesting subjects involved in the particulars of this valuation, as well as in the general principle of it; we shall not enter upon any of them now, but merely allude to the fact in order to invite the criticism of our correspondents.

This is a case in which the tenant apparently requires to invest a large amount of dormant capital; were it really dormant throughout the period of his lease, only re-appearing at the close of it by sale to the next tenant, there would be just cause for fear that the necessity for its outlay would embarrass the farmer, and so by confining competition for tenancy to a smaller number—viz., large capitalists—this system might diminish the value of land to its possessor; but this is not the case; this sum of money, amounting in the instance before us to 1000*l.* and upwards (see classes *d. e. f. g.* inventory), is evidently productive of profit as much as any other part of the farmer's capital. The incoming tenant informs us that he is well satisfied that he has got his money's worth; he is satisfied—opponents of this system of entry cannot but acknowledge that outgoing tenants under it have every reason to be satisfied—and for two reasons we think that of all those parties who have any connection with the matter, the landlord has the least reason to complain. At the close of each tenancy his land reverts to him in the highest possible condition—he offers it in the highest state of cultivation; and an arrangement which insists on an immediate outlay of capital by the tenant is the best possible security for his rent.

We were wrong in saying there were but three parties interested in this matter. Besides the interest of the landlord and that of the two tenants between whom the business lies, the prosperity of a whole nation is intimately connected with a system which encourages the investment of capital in land.

* The price was thus low, because the manure was not perfectly made, nor was it of good quality.

† This is left from tenant to tenant unpaid for, as stipulated in the lease.

ON BLACK HORSEPONDS.—No. III.

WE have stated that the solid matter contained in the urine of man and animals is equal to the best guano as a fertilising agent, and that it contains all the elements that are found in guano, capable of supplying plants with either organic or inorganic food. That such is the case we are prepared to expect, when we reflect that the herbivorous animal derives its sustenance from the plants used by it as food, and that, after those substances which are required in the animal economy are separated and worked up, the remainder is expelled from the body as excrementitious matter—the urine containing the greater portion of the soluble saline and earthy salts, as well as the principal amount of nitrogenous matters—while the solid excrements are principally made up of undigested woody fibre, with a few salts and a little nitrogenous matters. All these salts having originally existed in the plant, but been separated and rearranged during their passage through the animal, they are capable of again entering the texture of the plant, ministering to its growth, and assisting as a means of perfecting its seed. Before such can be the case, however, these substances must be in a state of perfect solution in water, the roots of plants being incapable of receiving into their texture any solid matter, however minutely divided. Hence the cause of the rapid and marked benefit following the application of soluble saline manures, such as the nitrates of potash and soda; or mixed manures, containing soluble salts in combination with substances which must undergo decomposition before they become soluble, and capable of ministering to the growth of plants. This fact should always be borne in mind, that no substance can enter the texture of a plant except in solution. From the above circumstances it necessarily follows that the liquid portion of the excrements must be of more value as a manure to plants than the solid portion, since the liquid excrements contain by far the largest portion of saline and nitrogenous matters, and in the only state in which they can be serviceable to plants. The composition of the urine of the cow will serve as an example to illustrate this point; at once showing the large amount of potash, soda, ammonia, phosphates, and other saline ingredients lost to the farmer who allows the urine of his cattle to run into the nearest ditch, or, by finding its way into his horsepond to become the disgusting beverage of his farm-yard stock.

The following is the composition of the urine of the cow, as given by Sprengel, and examined under three circumstances, viz., when fresh—after it has undergone putrefaction—and when allowed to putrefy with the addition of its own bulk of water.

	Fresh.	Putrid.	Putrefied with Water.
Urea	4000	1000	600
Albumen	10	—	—
Mucus	100	40	30
Benzoic acid	90	250	120
Lactic acid	596	500	500
Carbonic acid	266	165	1533
Ammonia	205	487	1623
Potash	664	664	664
Soda	554	554	554
Silica	36	5	8
Alumina	2	—	—
Oxide of iron	4	1	—
Oxide of manganese	1	—	—
Lime	65	2	8
Magnesia	36	22	30
Chlorine	272	272	272
Sulphuric acid	405	388	332
Phosphoric acid	70	26	46
Acetic acid	—	1	20
Sulphureted hydrogen	—	1	30
Insoluble earthy phosphates and carbonates	—	180	150
Water	92,531	95,412	95,481
	100,000	100,000	100,000

By far the largest portion of the organic constituents contained in the solid matter of the urine is the *urea*, and this also is the most important, since it contains a larger amount of nitrogen than flesh or blood,—two powerful manures. It is composed of

Oxygen	26.7
Hydrogen	6.6
Carbon	20.0
Nitrogen	46.7
	100.0

When in a state of purity, urea exists as transparent colourless crystals of a slightly pearly lustre. It deliquesces in a moist atmosphere, but otherwise undergoes no change. Its solution in water may be exposed to the atmosphere for several months, or be heated to the boiling point without change; but when the other constituents of urine are present, it putrefies with rapidity, being almost entirely resolved into carbonate of ammonia; this change proceeds at a more or less rapid rate, depending on the temperature of the atmosphere. The carbonate of ammonia thus formed is partly held in solution in the water of the urine, and partly escapes into the air; this escape of ammonia continuing for a considerable time, the solution becoming gradually weaker and weaker until at last a very small portion of the original quantity is left. The ammonia thus generated by the decomposing urea of the urine is sensibly felt on the eyes and nose on entering a stable in the morning that has been closed during the night, and is frequently the cause of those inflammatory affections of the eyes which young horses are subject to, from its acting as a direct and constant irritant on the delicate conjunctival membrane of the eye.

When urine is diluted with an equal bulk of water before it is allowed to putrefy, a much larger quantity of ammonia is retained in solution; thus, on referring to the analysis, we find that when the urine is allowed to putrefy alone, only 487 lbs. of ammonia are found in 100,000 of urine; but when diluted with an equal bulk of water previous to fermentation, the amount of ammonia is found to be 1622 pounds, or upwards of three times the quantity contained in the undiluted urine: but even this is not the whole quantity of ammonia capable of being yielded by the urea, by one-fourth; since 100 parts of urea ought to yield, by their decomposition, 56½ parts of ammonia.

It is to the ammonia generated in the soil by the slow decomposition of all animal manures that much of their effects on the crops are to be ascribed. This is particularly the case with good guano, which contains so large a portion of those substances capable of yielding ammonia to the growing crops; yet how little attention is bestowed by the practical man on the urea, which, as urine, finds its way out of his fold-yard, in solution in water, to the nearest ditch, and often to his horsepond; or takes to itself wings after fermentation, in the shape of ammonia, and, unseen and unheeded, passes off into the atmosphere; and thus the means of realising hundreds of pounds, which in many instances can be but ill-spared, is totally lost to the farmer.—*Alfred Gydé, Painswick.*

ON THE CULTIVATION OF FLAX.—No. VII.

THE breaking of the woody part of the stem, for the purpose of separating it from the fibre, is the next process in the manufacture of Flax. Before undergoing this operation, it has been usual in Ireland to dry it by artificial heat; but this, although it makes the stem more brittle, and of course more easily separated from the fibre, is also injurious to the fibre itself; and if proper means are taken to have the Flax thoroughly dried after being taken up from the Grass, no further artificial drying will be necessary. Should the Flax, however, still be damp from defective management, artificial heat must be employed; but it is to be observed that this is only to be continued so far as to dry the Flax, and not to roast it, as is too frequently the case.

Various contrivances for breaking the fibre of the Flax are in use. The machine most commonly employed is represented in the accompanying figure. It consists of

two wooden frames, attached to each other by a hinge, the cross-bars of which are so placed that two of them shall not be opposite to each other, the upper frame having usually a bar less than the lower one. The breaking machine here figured has the upper frame acted on by a spring, which raises it to admit of the Flax being introduced between the bars; and by means of a simple contrivance, also represented in the engraving, motion is communicated to that frame by means of the left foot of the workman. By repeated strokes of the upper frame on the lower one—the handful of Flax being changed and turned between the strokes—the woody part of the stem is at length broken in such a manner that it can afterwards be entirely removed by the subsequent operation of scutching.

The other methods of performing this operation need not be described at length, as they are more or less defective. In several parts of the North of Ireland a sort of large wooden mallet is employed, the effective part of which is the side; and the Flax being spread on a hard even surface, is reduced by repeated blows of this implement. By attention, the work is sufficiently performed in this manner, the only objection to the use of the mallet being the length of time required to effect the purpose by it; however, when only small quantities of Flax are grown for domestic purposes, it may be advantageously employed. The Flax is also sometimes bruised by a large

stone being rolled over it, which is put in motion by horse-power; but it performs the work very imperfectly.

The operation of bruising the Flax may also be performed by rollers placed close together, and revolving in contrary directions, similar to those through which the unthrashed Corn passes in the thrashing-machine. When Flax is grown in large quantity, this is perhaps the most eligible plan which can be adopted.

Scutching the Flax may also be performed by machinery, or by manual labour. Hand-scutching is almost universal on the Continent, and when carefully conducted, performs the work in a very superior manner to what it can be done by machinery. Where Flax is extensively cultivated, however, hand-scutching is evidently inapplicable, from the difficulty in procuring the necessary hands for the work; and in this case machinery must necessarily be employed. The construction of the common Flax-mill is exceedingly simple. Scutchers, or wipers, are placed on a horizontal axle, which thus resemble the spokes in a carriage-wheel, having however their edges considerably sharpened; and motion being communicated to this axle by means of a water-wheel or steam-power, the scutchers act on the handfuls of Flax which are presented to their action, resting on a board placed for the purpose. This completes the preparation of Flax for the market; and with the further details of its manufacture to prepare it for the spinner, the farmer is not concerned.

These, then, are the chief details of which it is necessary the farmer should be in possession before entering on the cultivation of Flax; and his success or failure will depend in direct proportion on the manner in which he has carried them into execution. In the cultivation of grain every farmer is aware of the loss sustained by the exhibition of an inferior sample at market, and in a still greater degree will this be experienced by the Flax-grower. Every operation connected with its cultivation and management must be performed with the greatest care, and when this has been done the farmer may calculate on a golden harvest. The defective system adopted by our Flax-growers became apparent on the opening of our ports to the foreigner, and so unremunerating did prices in consequence become, that until lately our manufacturers were in a great degree dependent on the foreign market for their supply. It is to be hoped that in the vigorous measures which are now in operation for the extension of the culture of this crop, the importance of proceeding on correct principles will not be overlooked, otherwise all efforts for the purpose will be worse than useless.

The produce of Flax, even under the best system of management, will vary much according to soil, season, and many other particulars. In those parts of the Continent where its culture is so well understood, it is esteemed their golden crop, and regarded as superior to any other on the farm. The ordinary produce there is from 20*l.* to 30*l.* per acre, independent of the seed, which is worth 5*l.* or 6*l.* more. The seed alone, which has for the most part been altogether neglected in this country, may, at a low calculation, be assumed to repay the cost of the seed sown, with all other charges attending the cultivation and management of the crop, leaving the fibre altogether as net proceeds. The produce in fibre will vary from four to six cwt. to the acre.

In our next paper on this subject, which will conclude the series, the saving of the seed and its application shall be described at length. Meantime, before dismissing the subject at present, another, though perhaps the least important advantage derived from Flax cultivation may be noticed, namely, the value of the water in which the Flax has been steeped, as a manure. Flax water is especially valuable when allowed to run over Grass lands, from the large quantity of vegetable matters, partially decomposed, which it holds in solution. Even the small portion of these matters carried from the pond by the Flax itself, when washed off by rains on the Grass, is found to sensibly affect its growth. After a trial of the fertilising qualities contained in this substance, few farmers will be disposed to allow it to flow, without interruption, to the adjoining streams, in which it generally proves fatal to whatever fish they may contain, as is now too often the case.—*J. Sproule.*

SKETCHES OF EAST LOTHIAN HUSBANDRY.

The amount of annual rent paid by East Lothian farmers, depends, of course, entirely upon the locality, quality of the soil, and other circumstances connected with the respective farms. During the reign of high prices, consequent on the French revolutionary war, several farms in this county were rented so high as seven to eight guineas per acre. The rent commonly paid at present in the neighbourhood of Dunbar, ranges between 4*l.* and 5*l.* per acre; but it must be taken into consideration, that this district enjoys very superior advantages for agricultural pursuits; the soil is dry and easily pulverised, the climate mild, and the earliest in the county; limestone and sea-ware, two powerful fertilisers in the hands of the skilful farmer, are obtainable in abundance; and a weekly Corn-market has been recently established there. In the elevated parts of the county, the stock farmers seldom pay more than 12*s.* to 15*s.* per acre; but the general average money-rent throughout the county ranges from 2*l.* to 2*l.* 15*s.* per Scotch acre; and, where Corn-rents are paid, from 6 to 9 bushels of Wheat, computed or converted into money, according to the medium county fiar prices. Mr. Greg, of Hertfordshire, asserts, in one of his letters on the subject of Farming in the Lothians, published some time ago in the *Manchester Guardian*, that "the rent of the Lothian farms is 3*l.* to 7*l.* per acre." And immediately he adds, "And those high rents the farmers not only pay, but thrive upon; indeed, a more thriving set of men I never met with." This statement, it must be admitted, applies solely to the neighbourhood of Edinburgh, to which Mr. Greg's knowledge of the Lothians seems to have been principally confined. I venture to affirm, that the annual rent paid by the Lothian farmers does not, on an average, exceed one-half of the mean between the extremes of rental, mentioned by this gentleman.

The rents are paid either previously to the first crop being taken off the land, when they are termed *fore-rents*, or they are paid at a subsequent period, when they are styled *back-rents*. Thus, if a farmer enters at Whitsunday, 1844, and at separation of crop 1844 from the ground, his first year's crop will be that of 1845; his first term's rent does not become due till Candlemas, 1846, provided the farm is back-rented. The object of this arrangement is to afford the tenant the means of paying his first rent from the sales of his first crop. The general terms for the payment of rent are Candlemas and Lammas—the year's rent being paid in equal proportions, one-half at each term.

Besides what is properly called rent, several public and parochial burdens are borne by the East Lothian, in common with other Scotch farmers. The principal of these are, income-tax, window-tax, poor-rates, schoolmaster's salary, road-money, &c. Tenant-farmers in Scotland, whose annual rental is not below 420*l.*, pay 2½*d.* per 1*l.* on the rental, as income-tax. The profits arising from the occupancy of land in this country, being reckoned at nearly one-third of the rental, farmers whose annual rental is less than 420*l.*, are exempt from this tax. The window-tax is payable by all Scotch farmers whose rental is not less than 200*l.* per annum. Dairies and cheese-rooms are exempt, provided that the words "Dairy" and "Cheese-room" are painted over their respective doors or windows. The amount of tax varies, of course, with the number of windows in the house. It is a generally believed, though a very erroneous supposition, both in England and in Ireland, that there are no poor-rates in this country. It is true, indeed, that Scotland has no large and costly edifices, in which to house her aged and helpless poor. Pauperism is here regarded as a disgrace. Nothing but the most pinching necessity compels even "the poorest of the poor" to seek admittance on the poors'-roll; and hence the poor-rates are generally very moderate. The management of the poor is vested in the minister and Kirk-session of each parish, and the funds for supplying their necessities are derived from voluntary collections at the church doors, and an assessment on the heritors or proprietors of the parish, laid on by themselves, one-half of which is paid by the farmers, according to their rental. Assistance is in general given only to the aged and feeble, who are really indigent, and averages about 5*s.* a month to each person receiving in-door relief. The amount usually borne by the farmer is very moderate, but in some parishes it is increasing to rather a serious extent, arising, no doubt, from want of sufficient employment for the labouring classes. In the parish in which I reside, containing a population of 700, without any town or village, the poor-rates have latterly risen to about 90*l.* per annum. The rental of the parish, as assessed in 1843, is 7339*l.* 6*s.*, that is, at the rate of about 1*s.* 4*d.* per pound on the rental, for the tenant's share.

Scotland has been long distinguished for its parochial schools. The schoolmasters are paid by a fixed salary—one-half of which is borne by the tenants—in addition to small fees which he is entitled to receive from his pupils. The maximum fixed salary is, I believe, 34*l.* 4*s.* 6*d.*; the minimum, 25*l.* 14*s.*

By a recent county regulation, sanctioned by Act of Parliament, every 60 acres of arable land is denominated a ploughgate, being the extent which one pair of horses is supposed to be capable of working. For every 60 acres of arable land, or for every pair of horses, the farmer has to pay generally 2*l.* towards the fund for keeping in repair the roads in the parish in which he resides.

In order to illustrate more clearly—for the subject has been frequently misrepresented—the amount of rent and public burdens borne by tenant-farmers in this district, I give the following example. The farm consists of 350 acres, five miles from Haddington, and 250 feet above the level of the sea: soil a strong clay, very expensive to labour, employing always six and frequently seven pairs of horses.

Rent of 350 acres, at 2*l.* 5*s.* per acre	£787	10	0
Income Tax	£8	0	0
Window Tax for 16 windows	3	17	6
Poor Rates for current year	4	0	0
Schoolmasters' salary	1	0	0
Road-money (six pairs of horses)	12	0	0
Dog	0	8	0
Public burdens	29	5	6
Rent	787	10	0
Total	£816	15	6

Rents are paid either wholly in money to a fixed amount, wholly in Corn, computed by the fiar prices of the county, rising and falling with the fluctuations of the market, or partly in money and partly in Corn. Each of these modes of payment has its advocates, and much diversity of opinion prevails even among the farmers themselves respecting the comparative utility and safety of the respective modes of payment. They appear to agree only on one point, namely, that of all kinds of rent a fixed money-rent is the worst for the tenant. This mode of payment is, however, very common in East Lothian, and is generally preferred by the landlords.

The Corn-rent system is decidedly the most popular, if not the most common, in this and some other parts of Scotland, being almost universally regarded by farmers as the safest mode of payment in an average of years. But Corn-rents, however popular, are, under existing circumstances, liable to numerous objections. That the rent bears heaviest upon the farmer when, from a bad season, and deficient crop, he is least able to afford it, is certainly a very serious defect in this system. It must be taken into consideration, too, that the landlords' rents would be sometimes nearly doubled, at a time when farmers and others are suffering from scarcity and consequent dearth. On the other hand the Corn-rent plan affords this great advantage to the farmer, viz.: that in years of unusual abundance, when prices are considerably depressed below the general level, they are saved from almost certain ruin, by the comparatively small rents they have to pay, while having, at the same time, an augmented quantity of saleable produce. In such seasons the effect of Corn-rents would evidently be an improper reduction of the landlords' income.

To obviate these and other evils attendant on the Corn-rent system, a simple expedient has been adopted by some landlords, and which has gone far to remove many of its defects: this consists in fixing a maximum and a minimum price for the particular species of grain, payable as rent. It is stipulated, on taking the farm, that a certain quantity of Wheat, or other grain, is to be paid to the landlord, converted into money, according to the fiar or average prices of that year's crop; but to whatever extent prices may rise above the maximum price originally fixed upon, the tenant is not required to pay such excess of price. On the other hand, it is agreed upon, that to whatever extent prices may be depressed below the fixed minimum, the landlord is entitled to receive this minimum price for the quantity payable to him.* By means of this check, the tenant is not compelled to pay up to the average price of grain in very dear and scanty years, which would evidently be ruinous; while on the other hand, in years of unusual plenty and depressed prices, the landlord is preserved from the unpleasant consequences of a greatly reduced rent-roll. Various other schemes have been propounded for averting the evils of Corn-rents, such as taking a seven years' average of the yearly fiar prices, and computing the rent by this average price, &c.; but all of them have been found more or less defective when brought to the test of practice. The species of grain generally adopted in this county for rent is Wheat, but in some of the elevated farms, where this is not grown, Oats and Barley are taken.

The farmers of this county generally prefer a mixed mode of payment—partly in Corn, or rather the price of Corn, and partly in money. This system appears to work very satisfactorily both for landlord and tenant, and accordingly mixed rents are becoming general. One very obvious advantage of this plan arises from the circumstance of Corn not being the only produce of a farm. Although East Lothian is, as has been already stated, essentially a Corn-growing county, yet a large number of the farmers make a considerable portion of their rent from the sale of cattle and sheep, or by letting Turnips and Grass to dealers. The common amount of mixed rent paid at present for medium quality of land is one boll of Wheat, second fiar, and one pound of fixed rent.—*T. Sullivan.*

ON THE TURNIP-FLY.

Some years ago I farmed some uninclosed lands, and having a somewhat speculative neighbour having portions in the same open field, we occasionally tried experiments conjointly, the intermixture of these common lands being in some degree favourable for such practices. After reading most of the "infallible remedies" of the day for securing the Turnip-crop from the ravages of the fly, we each selected one of two experiments for one season's trial. My friend's choice was a mixture of some other seeds of earlier vegetation than Turnip-seed, that the fly might have its fill and pass into its change before the Turnips came up; a portion of Radish-seed was accordingly mixed with the Turnip-seed, which certainly came up first, but, contrary to expectation, the enemy left the Radishes untouched, but finished off every plant of the Turnip-crop, according to the regular practice. This left plenty of room for the Radishes to grow, and they produced a very abundant supply for the whole parish. My experiment was a more expensive and laborious exploit; we had been reading Sir John Sinclair's method, which was to burn the land previous to sowing the seed, thereby destroying the grub or chrysalis containing the Turnip beetle in its embryo state. There is but one objection to this system, which most assuredly is a certain remedy, but, from the consumption of the material, it is in a manner impracticable. The author recommends collecting together everything combustible about the farm—the cuttings of hedges, the clearings of ditches, &c., together with what straw can be spared (?); these are to be strewed over the land, and burnt on the ground, a few hours or so before the seed is put into it. The material we got for this purpose by raking off the old Wheat-stubble from the young Clover plant, such being the practice of cropping. Two ridges (called acres) were selected for this roasting—the process much resembles our practice of burning a fat pig for bacon. That season was remarkable for the destructiveness of the fly, but the two ridges were untouched, they flourished amid the desolation of barrenness around them; and it was worthy of notice, as confirmatory of the effect upon the crop, that the half of the next ridge of land to windward was partially secured by the effect of the conflagration.

* I am acquainted with several farmers on the Earl of Wemyss' estate who have a maximum of 72*s.* per quarter for Wheat, and no minimum.

It has occurred to me, that, as no farmer ought to consume the quantity of straw necessary for this process, whether a less expensive means could not be adopted to bring about the like result; a heated roller, if such an implement could be constructed—even a plain sheet of iron, if heated sufficiently to destroy insect life; the cost of coals would be a trifle, in comparison with the good to be effected.

Looking to the natural history of the insect, it appears to remain in the ground a considerable time, undergoing the different changes of egg, maggot, and chrysalis; it is in this latter stage that the plough and harrow bring certain quantities to the surface, or sufficiently near the surface to be within the influence of the sun's rays, and the hatching of the chrysalis is brought about simultaneously with the appearance of the Turnip-plant. This accounts for the preservation of the plant by early vegetation, for it thus gets sufficiently advanced to be unpalatable to the insect by the time the fly appears.—*S.C.*

ON THE APPLICATION OF CHEMISTRY TO AGRICULTURE UPON RATIONAL PRINCIPLES.—No. XVII.

(*Concluded from p.* 304.)

Now, I must request the observer to remark several points of great interest in the results obtained by the above experiment. I may observe that I superintended the management of the experiment from beginning to end personally; that I took every possible means to prevent the slightest mistake. I saw the land prepared and the liquid applied, and I was present when the crop was mown, carted, threshed, weighed, and measured.

The experiment, I grant, stands at present unsupported by others, and my own duties will not permit me to spare the time and attention it would require for repetition; but I am so confident in the correctness of every step, and the care which was taken to avoid mistake, that until the facts which I have adduced are controverted by other experiments equally sound, I claim for it the credit of being a step in advance, and of proving the truth of chemical induction.

Liebig stated that a pound of urine will produce a pound of Wheat. In the first experiment which I have instituted, I have produced from 80 lbs. of urine 78½ lbs. of grain and straw. It is true that an additional substance, the sulphuric acid, was introduced, and how much of the increase of crops was due to that, *per se*, future experiments will decide. Its cheapness will rather add than detract from the value of urine as a manure.

Another point of interest in my experiment, is the proof which it affords of the truth of the principles I have advocated—that plants require for food a union of their constituent elements in the proportions in which they exist in the plant—that the straw and grain contain different elements, and require different manures. The liquid in my experiment was applied especially for the grain, and in every case there was an increase of grain, both in measure and weight; while in three of the instances, there was a loss of straw; and in two out of the other three, the increase of straw was only one-half that of the grain in one, and one-third in the other. Now, urine contains some of the elements of straw, and, of course, will produce it to a certain extent; it contains much more of the elements of grain, and much more grain was produced.

Another point of interest in my experiment is, that where chemical means were adopted to retain the nitrogen, the weakest solution had the greatest amount of produce; while, where no fixing medium was used, the strongest solution had the most successful result. I have no doubt but that the strong solutions were injurious to a portion of the grain, and prevented its germination. Guano, if applied too strong, will kill the seed, and so will urine, particularly if the urea is converted into the sulphate of ammonia. In future experiments, it would be advisable to use the fixed urine in different states of dilution. The fact that the sulphuric acid prevented decomposition, is interesting. Whether the urea was decomposed in the earth or not is of no importance in a practical, though of great importance as a chemical question, because it bears strongly upon Liebig's statement, that the carbonate of ammonia is the form in which nitrogen is supplied to plants.

Some light would be thrown upon this subject, by a comparative experiment of the effects of urine with the decomposition prevented or retarded, and that in which the ammonia was fixed with the acid during the process of decomposition. I would propose the following experiment:—

Procure two wooden vessels—old beer casks are the best for experiment, because their exact measure is known. Let them be marked A and B. Into A, for every gallon that it will hold, add, in the first place, half an ounce by weight of sulphuric acid, of a sp. gr. not under 1.7. A gallon or two of water should be put into the bottom of the cask, and the acid had better be added at different times, because if too much is put in at first it will act upon the wood. Let this tub be filled with urine as it can be procured.

Into B let the urine be collected at once, without any acid; but as soon as it begins to putrefy, let sulphuric acid, the same as above, be added, until all effervescence ceases; and let this be repeated until the tub is full. Then let the contents of each tub be applied to the land as follows:—

No. 1. Half of A, in the proportion of 100, 150, and 200 gallons per acre, diluted with two, three, and four times its measure of water; and let it be applied to the land a week or ten days before the seed is sown; and let this crop be Wheat.

No. 2. The other half of A in the same proportion, the crop being Beans.

No. 3. Half of B in the same proportion to Wheat.

No. 4. Half of B in the same proportion to Beans.

Let the amount of seed and produce be carefully weighed and measured. For the sake of comparison, a patch of land of the size used in the experiments must be treated without manure of any kind. To those who have plenty of time and land, I would recommend another experiment to be tried, by adding, in addition to the acid to tubs A and B, one bushel or one and a half of well-ground bone-dust.

To a third class of experimenters I would suggest that the urine prepared, as I have advised, should be tried comparatively with good rotten farm-yard manure, using the usual quantity per acre of the muck, and the quantities on different patches I have advised with the urine; and the latter class of experiments might be advantageously tried with Wheat and Turnips, or Mangold Wurzel, instead of Beans. In fine, the experiments which suggest themselves are innumerable, and let no one be cast down by defeat or disappointment. The value of an experiment, if sound, is great even if it fail, for truth is elicited.

I have thus brought the subject I proposed to treat of to a close. At a future time, if anything interesting to the scientific farmer should suggest itself, or if he should attach any value to the observations I have offered, and which I trust have been made in the true spirit of inductive reasoning, I will cheerfully bestow my time and attention upon what I consider one of the most interesting and useful of studies—that of endeavouring to supply the increasing necessities of a great nation, by pointing out those principles which chemical science suggests as most likely to be conducive to the establishment of a rational system of agriculture.—*C. R. Bree, Stowmarket.*

Home Correspondence.

Observations on the Potato.—The papers which have appeared on the failure of the Potato are very numerous. I have read a great portion of them with attention; but as far as I can judge they have not named the true cause. For the most part they say that the failure in this valuable root is owing to the use of over-ripe tubers. Here I beg to differ from them, being of opinion that the great cause of failure lies in improper cultivation, storing, and using unripe tubers for seed. It is well known to every horticulturist that if his tuberous-rooted plants (*i. e.* the tubers) have not been properly matured before the time of taking them up, they become deteriorated, and seldom, if ever, produce vigorous plants the following season, and ten chances to one they rot when replanted; if they do not rot they produce unhealthy plants. Now, this is analogous to the Potato; for if the tuber is not ripe or properly matured, it cannot contain a sufficient supply of suitable nourishment to support the tender buds or shoots until they have become furnished with roots for that important purpose. Another great error is allowing them to grow in the pit or storehouse, before being planted. Whenever Potatoes show the least signs of vegetation, they should be immediately planted, if the season will permit, for allowing them to grow in the pit must naturally exhaust that nourishment which should go to the support of the young buds or shoots when planted; and the second growth of shoots is thus never so healthy and vigorous as those which were produced at first. In regard to culture, nothing can be more at variance to the laws of nature than the present system of cultivating this valuable tuber. The Potato may be cultivated in any soil, and almost every climate, and with much less manure than is generally used, if the land has been properly pulverised. The Potato is, however, subjected to one uniform mode of culture by the British farmer; and why? because in this, as in most all other cases, he still follows in the steps of his forefathers, without inquiring whether the practice is consonant with the nature and habits of his crops. On the first appearance of a plant above the ground, remove the earth carefully from the stem, and it will be seen, even at this early stage, that young fibres are sent out in all directions in search of nourishment, which the tuber or set can no longer supply, being at this time greatly, if not entirely, exhausted of all nourishment. These fibres will be found to grow much more rapidly than the stem, so much so that some of the fibres will have extended 13 or 14 inches in search of food, while the stem has only gained two or three inches in height. Nothing, then, can be more opposed to the future welfare of the crop than the repeated application of the horse and hand-hoe, for, by the too frequent use of these useful implements of husbandry, the fibres are cut and destroyed, and those which remain are, in a great measure, exposed to the influence of a scorching sun and dry winds, which must undoubtedly check their growth. The land intended for Potatoes should be ploughed, as soon as the growing crop is harvested, with a good deep furrow, and after being for some time exposed to the influence of the atmosphere it should be thoroughly harrowed: after remaining thus for a short time, it should again be ploughed and harrowed. In spring it should again be twice ploughed, in contrary directions, and harrowed, hand-weeded when necessary, and rolled. If this was properly attended to, in the preparation of the land for Potatoes, very little after-hoeing and hand-weeding would be required. As the greater portion of the weeds which infest properly-cultivated lands are either annual or biennial, they may be readily pulled up by the hand, and laid on the surface of the soil to rot, without destroying the fibres of the Potato. Farmers may rest assured that the less the soil is disturbed after the Potatoes are planted, the more certain and luxuriant will be the crop. However objectionable the Irish system of lazy-beds may appear, it yields large and fine crops, with very little manure; the fibres or roots of the plant are left to grow and luxuriate at pleasure, with very little, if any, hoeing to disturb them. After the soil has been thoroughly pulverised, and the dung and seed ready, which should be the small whole tubers, commence planting as soon as the season will permit—the earlier the better—by draining the drills at from three to four feet asunder and seven to eight inches deep; for the wider the drills are from each other, the plants will have the more room to develope their leaves and branches, and the deeper (within proper limits) the seed is planted the more prolific and certain will be the crop, and the less earthing up will be required. In fact, I am of opinion that the Potato crop should be planted in autumn instead of spring, and that pitting and housing are highly injurious to the seed Potato. In proof of this, it must be known to every farmer that those Potatoes which have by accident been left in the field, and at a considerable depth in the soil, produce finer plants and tubers in spring than those which have been pitted or housed; and those tubers which have thus remained during winter in the soil are free from all diseases and failures. I would, however, recommend for autumn planting that the land intended for Potatoes lie in fallow all summer, and be thoroughly pulverised by repeated ploughings and harrowings, to destroy the vegetation of weeds. As soon as weeds make their appearance they should be hand-hoed, or pulled up by the hand, and left to rot on the surface. When the plants have arrived at a proper height they should be earthed up, which should be done only once. When the crop is ripe, those Potatoes which are intended for seed should remain in the ground till the time has again arrived for planting; for, let them be stowed in the most careful manner, they are liable to heat and grow in pits, which, if not the real cause of failure, tends greatly to promote it. For instance, set aside a few tubers which have been gathered in the common way, and it will invariably be found, although they may appear perfectly firm and sound, before many weeks have elapsed, symptoms of decay may be observed. No doubt this is owing to their being bruised by falling one against the other, and by the too common use of the shovel in turning them, to prevent their heating, and to check the growth of the buds. In pitting Potatoes for domestic purposes (for seed Potatoes, in my opinion, should not be pitted), I would recommend alternate layers of sand or charcoal and Potatoes. This will keep them cool, and free from heating and sprouting. After a sufficient quantity of Potatoes, sand or charcoal have been piled together, put a layer of dry straw next the Potatoes; then cover the straw with a layer of six or seven inches of earth, which should not be trod, but receive a gentle clap or two from the back of the spade; then secure all with a coat of thatch, which should be fastened by ropes, to prevent the winds from disturbing it, and they will keep much better, and more secure from frost than in any house. In conclusion, I beg to offer the following suggestions:—Thoroughly pulverise the land by repeated ploughings and harrowings; never use unripe tubers for seed; never pit seed Potatoes if it can be avoided; never cut them if it is possible to procure medium-sized ones; plant Potatoes in autumn, if the season and circumstances will permit; make the drills much wider apart from each other, and deeper than is generally practised; use well-fermented farm-yard manure; employ the horse-hoe and plough as little as possible, after the plants have made their appearance above ground; hand-weed on all occasions, but never remove the weeds from the land, (*i. e.*) if they have been pulled before their seed pods are formed; remove all flowers as soon as they make their appearance. I hope the foregoing observations will be the means of inducing some of your more able correspondents to come forward, and lay their observations on this important subject before your readers; for, as you remarked, in answer to my question on this subject, "There is nothing like a properly-conducted discussion for eliciting truth."—*J. M'I., Hillsborough.*

Substitute for Guano and Bones.—Two facts were obvious to me long ago; viz., that bones owe their powers, more especially with reference to Turnips, to their earthy constituent, the phosphate of lime; and that many years could not elapse ere the light soils of England must once more go out of cultivation, without some succedaneum could be found. The same opinion applies to guano, for no person can anticipate any long-continued supply. It is satisfactory, therefore, to know the substitute for the one is almost identical with, and therefore at least equal to, the other. And it is still more so to know that an inexhaustible supply is at hand, the collecting of which will do more with reference to the sanitary regulations of all large cities, than any other precaution whatever. Twenty years ago I published, under the signature of "De Winterton," in the *Hull Rockingham*, and again, since reprinted in my own name, in the columns of *Bell's Weekly Messenger*, the means of securing such substitute, by collecting human urine, giving to it about fourteen pounds of sulphate of magnesia (Epsom salts) to every hundred gallons, and adding lime in the state of hydriate (that is, slaked). Such a mixture contains all the elements of bones and guano; and although more than one private empiric and public company have adopted the process, for profit, it still remains comparatively unknown. I calculate more than one hundred gallons per month are thrown away in every minor farm-house, while in towns there is great waste in this way.—*W. M. Dinsdale.*

Science of Farming.—The results of the experiments detailed at page 293 of your Journal are most perplex-

ing, not to say discouraging, and lead me to remind you of your promise of giving us a *resumé* of the arguments in support of the generally received idea of the great value of ammonia as a fertiliser. At any rate, pray be good enough to favour us with some clue to the *rationale*, the *modus operandi* by which the favourable result was obtained from the admixture of lime with horse-dung—an admixture against which we are repeatedly cautioned by scientific writers, who also warn us against neutralising the benefits to be expected from guano by bringing it into contact with lime. I had hoped that, at the expense of some labour, I had arrived at something like an acquaintance with the subject; but here I find myself quite puzzled, and the more so, as it must be confessed that similar results are given by Mr. Johnson, in his admirable work on Fertilisers, as at p. 87 of my edition—which is not the latest, "'tis true 'tis pity, and pity 'tis 'tis true." By-the-by, as it is not a book to be purchased over again every now and then, might not Mr. J. print the new matter, in the form of a pamphlet, for the benefit of those possessing the old editions? It is really a hardship to purchase a 12*s.* book one week, and the next to find it very nearly superseded by a new edition, as was my case. But to return to the experiments. May one hope to find one's way to a conclusion, through the medium of the following passage, from the last but one of Mr. Bree's papers, where he reminds us that "the inquiries of Liebig render it more than probable that the carbonate is the only salt of ammonia which is appropriated by the plant, &c. &c.?" If this is the case, then the chief utility of fixing our ammonia, as by sulphuric acid, must be to preserve it from volatilisation, until laid into the ground, and until the carbonate can be used by the plants as fast as it is generated.—*M.D.* [Our correspondent will find that, in fulfilment of our promise, we referred shortly to the subject of his communication some weeks ago (see No. 16). The experiment he alludes to was probably performed in order to ascertain how much the manure would be injured by depriving it of its ammonia; but the evidence existing as to the actual benefits which have been derived from ammoniacal manures appears to us so strong, that rather than regard the results obtained in this instance as militating against this evidence, we should be inclined to explain them, by supposing that the experiment was performed on ground which, while it was deficient in some of the ingredients of farm-yard manure, already possessed such stores of ammoniacal salts as, with what in common with all soils it derived from the air, rendered it entirely indifferent to that which might or might not exist in any artificial application.]

On the Use of Local Terms.—Although custom renders us familiar with local terms and expressions, and even reconciles well-educated men to their use, allow me to suggest to the contributors to your Paper, so valuable in conveying agricultural information throughout the length and breadth of this land—and not of this only, but also to America and the continent of Europe—the propriety of avoiding, or at least of explaining, terms and phrases which are only intelligible to the inhabitants of the districts in which they are used. For example—one valued correspondent from East Lothian, tell us, the landlords in that county are at the expense of erecting the farm buildings, "the tenants always *driving* the materials." This expression is perfectly intelligible to the people who talk of driving their Corn to market as well as their cattle, and does not sound at all strange in their ears; but a tenant in the South of England, who knows very well how to go to work to drive a herd of cattle, or a flock of sheep, would be much puzzled how to commence operations upon such unmanageable articles as stones, timber, and slates. In the North of England, the term is to *lead* such articles —a little more gentle it may be in appearance and manner, than to *drive*, but still inapplicable. In the West of England it is universally to *haul;* and other terms are used in other localties. Now, in a work so widely diffused as the *Agricultural Gazette*, perhaps it might be as well, and it certainly would not be attended with much trouble, to avoid the use of terms so strictly local, and to employ others of more general application; and instead of *driving*, *leading*, or *hauling* manure, coals, stones, &c., (the last is by much the most appropriate of the three,) to *cart*, *carry*, or *convey* them. I have known a foreigner, but one who understood the English language, much puzzled by the use which we make of "the Turnip-drill," applying the term indiscriminately to the machine by which the seed is sown, and the drill-ridge upon which it is deposited. And I confess, at the risk of being ridiculed for my extreme ignorance, that although I have had some experience in the cultivation of land, I do not understand the term that is used in your Number of the 18th instant, in some sensible remarks upon Turnip culture, made by the Chairman of the "Westfirle Farmers' Club," when he says that he would "broad-shear" the land after harvest, in preference to ploughing it in the common way. I think I can guess at the meaning which this term is intended to convey, but am by no means sure that I am right; and, as it comes recommended by good practical observations, and it is just possible that others of your readers may be as ill-informed as myself, perhaps you, or your correspondent, will be kind enough to enlighten us on the subject.—*John Grey, Dilston.*

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

The General Meeting of the Society, for the purpose of electing the President, Trustees, Vice-presidents, and twenty-five general Members of Council, for the year ensuing, and of receiving the Report of the Council for the past half year, was held, agreeably with the terms of the Charter, and due notice required by the Bye-laws, at the Society's House, in Hanover-square, on Wednesday last, the 22nd of May. Present:—The Rt. Hon. Earl Spencer, President, in the chair; Duke of Richmond (Chairman of the General Southampton Committee); Earl of Lovelace, Lord Camoys, Hon. Captain Spencer; Hon. Geo. H. Cavendish, M.P.; Sir John V. B. Johnstone, Bart., M.P.; Sir Richard Jodrell, Bart.; Mr. Pusey, M.P. (Chairman of the Journal Committee); Mr. Divett, M.P.; Mr. Raymond Barker, (Chairman of Finance); Reverends, D. Gwilt, T. Lewis, and J. R. Smythies; Professor Sewell; Colonel Elwood, Captain Forbes, R.H.; and Messrs. John Raymond Barker, S. Bennett, H. Blanshard, H. Boys, W. R. Browne, F. Crisp, W. Daniel, James Dean, Jos. Druce, S. Druce, E. East, John Ellman, P. Fearnhead, Y. Freebody, Brandreth Gibbs, J. B. Glegg, S. Grantham, C. Hillyard, W. Fisher Hobbs, G. Jacson, S. Jonas, G. Jones, G. Kimberley, J. Kinder, T. Knight, Geo. Wyld Lees, C. E. Lefroy, C. Porcher, T. Mount, Josiah Parkes, C.E., E. Parkins, W. T. Pickin, H. Price, Francis Pym, R. Rigg, W. Shaw, W. Smart, James Smith (Deanston), H. Strafford, P. Tillard, T. Tweed, Jonas Webb, and James-Wood.

The Members having delivered in their several voting-lists, signed by themselves respectively, for the election of the Council, the President proceeded to nominate Mr. Dean, Mr. Druce, and Mr. Shaw, to be the scrutineers of the ballot: when those gentlemen retired with the lists into an adjoining Committee room for the purpose of making the requisite examination. The Hon. Captain Spencer then rose to propose His Grace Duke of Richmond as the new President for the ensuing year. He was quite sure, in submitting that proposition for the adoption of the Meeting, that it was unnecessary for him to endeavour to pass any encomium on the high character of the noble Duke; his name would be associated with the Society as long as it endured; he was one of the original promoters and founders of the Society, and on all occasions had been found among the most zealous and active of its Members. Mr. Blanshard, in seconding the motion, referred to the steady interest at all times evinced by the Duke of Richmond for the welfare of the Society, and the great advantages which had always resulted from his cordial co-operation in carrying out the details connected with every branch of its business and proceedings.

The motion was then put and carried unanimously. The Duke of Richmond immediately rose to return thanks for the honour the Society had done him, in again electing him their President. He assured the Members that the new election they had then unanimously made in his favour gave him the highest satisfaction, inasmuch as it furnished to him a gratifying proof that his exertions in the cause of the Society, during his former Presidency, had met with their approval. The Society had already conferred the greatest benefits on the country at large: and in supporting its interests, and those of the agricultural community in general, it would be his great object to prove his gratitude, not merely by words, but also by deeds.

On the motion of Mr. Pym, seconded by Sir John Johnstone, the following trustees were unanimously re-elected:—

Sir Thomas D. Acland, Bart., M.P.; Hon. R. H. Clive, M.P.; Marquis of Downshire; Duke of Grafton; Right Hon. Sir James Graham, Bart., M.P.; Henry Handley, Esq.; Sir Francis Lawley, Bart.; Joseph Neeld, Esq., M.P.; Duke of Richmond; Duke of Rutland; Earl Spencer; Duke of Sutherland.

On the motion of Mr. Raymond Barker, seconded by Mr. Kinder, the following Vice-Presidents were unanimously re-elected:—

Duke of Buckingham, Earl of Chichester, Earl of Ducie, Marquis of Exeter, Earl Fitzwilliam, Sir Thomas Gooch, Bt.; Sir Charles Morgan, Bt.; Duke of Northumberland, Lord Portman, Earl Talbot, Duke of Wellington, Lord Worsley, M.P.

Mr. Shaw then reported the following result of the scrutiny of the ballot-lists. He had the satisfaction of stating that the election was perfectly unanimous, not a single vote having been recorded against the house-list as recommended to the General Meeting by the Council.

I. Members of Council not going out this year by rotation:—

Colonel Austen, Hon. W. B. Baring, M.P.; John Benett, M.P.; Samuel Bennet, Esq.; T. W. Bramston, Esq., M.P.; E. Buller, Esq., M.P.; Colonel Challoner, J. W. Childers, Esq., M.P.; Edward Fellowes, Esq., M.P.; Humphrey Gibbs, Esq., Lord Hatherton, John Hudson, Esq.; W. H. Hyett, Esq.; Sir John V. B. Johnstone, Bt., M.P.; Fielder King, Esq.; W. Miles, Esq.; M.P.; E. W. W. Pendarves, Esq., M.P.; Sir R. Price, Bt.; Philip Pusey, Esq., M.P.; Francis Pym, Esq.; E. A. Sanford, Esq.; J. V. Shelley, Esq.; T. H. S. Sotheron, Esq., M.P.; W. R. C. Stansfield, Esq., M.P.; Henry Wilson.

II. Members of Council re-elected:—

David Barclay, Esq., M.P.; T. Raymond Barker, Esq.; F. Burke, Esq.; H. Blanshard, Esq.; John Ellman, Esq.; S. Grantham, Esq.; W. G. Hayter, Esq., M.P.; C. Hillyard, Esq.; W. Fisher Hobbs, Esq.; Sir Hungerford Hoskyns, Bart.; S. Jonas, Esq.; G. Kimberley, Esq.; John Kinder, Esq.; Sir Charles Lemon, Bart., M.P.; Professor Sewell; William Shaw, Esq.; Hon. Captain Spencer; C. Stokes, Esq.; H. S. Thompson, Esq.; Geo. Wilbraham, Esq., M.P.

III. New Members of Council:—

W. R. Browne, Esq., (Wilts and Middlesex); Edward Gough, Esq., (Salop); Viscount Hill, (Salop); J. Allen Ransome, Esq., (Suffolk); R. A. Slaney, Esq., (Salop.)

The President then directed the Secretary to read the following Report from the Council:—

The Council, in laying before the Members at their present General Meeting their Half-yearly Report on the state and prospects of the Society, at the completion of the sixth year from the date of its foundation, have the satisfaction of recording the progressive fulfilment of its various objects. The excitement which attended its original formation, and the rapidity with which the importance of those objects was recognised by the friends of agriculture in every part of the kingdom, at once swelled the list of its Members to an extent unprecedented in the history of any similar institution. That excitement having roused the attention of the cultivators of the soil to the fact of the great resources within their own immediate power, has led them to seek with practical caution, but with an energy also proportionate to the advantages to be gained, those means by which the objects in view have appeared to them most likely to be attained and rendered applicable to their local circumstances. Not only have the leading Agriculturists of the kingdom come forward to aid the Council in carrying out to the best of their power the general collection and discussion of facts having an important bearing on the various branches of agricultural improvement, both personally at their meetings and as contributors through the pages of the "Journal," but within their own local sphere in the country, they have, in many instances, been instrumental in reviving the spirit of existing associations, or of establishing new societies or clubs of practical farmers for the observation, collection, and discussion, of such practical results as more immediately refer in the first instance to the improvement of their own local agriculture, but become afterwards generally applicable to other localities, placed under the same circumstances of aspect, soil, and cultivation. It has been the uniform desire of the Council to avail themselves of every opportunity by which the operations of the Society may extend their influence, and convey sound and practical information, through the numerous classes of its Members distributed over the various districts of the kingdom. While preserving its fixed locality for the transaction of official business in the metropolis as a centre, the Council have the satisfaction of referring, with great confidence, to the signal success which has attended the means of communication afforded by the distribution of the "Journal," the circulation of Cottage Tracts, reprinted from its pages, and the change from year to year of the locality in which the Country Meetings are held. In the more concentrated sphere of its legislative and official duties, the Council have to report the active measures taken by their various Committees to simplify the details connected with their respective departments, and to avail themselves of such results of experience as render the general transaction of business gradually more uniform, exact, and satisfactory.—The Society consists of the following Members; namely:—

Life Governors	96
Annual Do.	214
Life Members	442
Annual Do.	6161
Honorary Do.	15

making a total of 6927 Members on the books of the Society at the present time; and the Council have the satisfaction of reporting the steady accession of Candidates from every part of the kingdom, at each of their Weekly Meetings: no less than 274 new Members having been elected during the last three months and a half. Since the last General Meeting in December, the Council, at the recommendation of the Finance Committee, have ordered the names of 249 Members to be removed from the list of the Society; of these 31 were lost to the Society by death, and 157 struck out, either at their own request, on account chiefly of their having entered the Society at the Country Meetings, for temporary purposes only; or on the decision of the Committee, who have maturely taken each case of exemption, claimed under a variety of circumstances, into their special consideration: while the remaining 61 have withdrawn their names from the Society, for reasons assigned by them at variance with the fundamental rules of the charter.

The Finance Committee will lay before you the Auditors' Balance-Sheet of the accounts to the end of the year 1843, and, at the same time, report the actual state of the funds of the Society at the present time. They have also reported that, at the last General Meeting in December, the arrears of subscription due on previous years, to that date inclusively, amounted in the whole to 5724*l.*; since which time they have been reduced by the sum of 1124*l.* The Finance Committee having represented to the Council that, in some instances, they found great difficulty in recovering the arrears of subscription due to the Society, the following resolution was passed, namely:—

"That a professional person be appointed to write letters, demanding arrears of subscription, to all such parties as shall be designated from time to time by the Finance Committee; and, in case of such applications not being successful, to take further legal steps for enforcing the payments due." That Committee have accordingly already taken preliminary steps, under professional direction, for the recovery of some of the remaining arrears, but they still trust, that by the prompt payment of what is due, ulterior legal measures may be rendered unnecessary.

The Council feel it their duty distinctly to state, that the charter gives to them the undoubted right of enforcing the demand for any money due to the Society, in a court of law: if they are ever compelled to resort to that extreme measure, it will be with great regret; but it is their positive duty not to permit the useful objects for which the Society was established to be frustrated, by allowing the actual receipts to fall short of the legitimate claims of the Society.

The Journal Committee have reported the unusual excellence and sound practical character of the whole of the numerous Essays sent in this year to compete for

the prizes of the Society. They have announced the decision of the Judges in reference to an outstanding Essay of 1843, namely :—

To Mr. John Clarke, of Long Sutton, Lincolnshire, the award of the Society's prize of 15*l.* for the best Essay on the Management and Application of Farmyard Manure; and the following awards already made of the Prizes of the present year, namely :—

To Mr. R. N. Bacon, of Norwich, the prize of 50*l.*, for the best Report on the present state of the Agriculture of Norfolk.

To Mr. Robert Baker, of Writtle, near Chelmsford, the prize of 50*l.* for the best Report on the present state of the Agriculture of Essex.

To Mr. Edward Little, of Lower Sheldon Farm, near Chippenham, the prize of 50*l.*, for the best Report on the present state of the Agriculture of Wiltshire.

To Mr. John Bravender, of Cirencester, the prize of 50*l.*, for the best Essay on the Indications of the Fertility or Barrenness of Soils.

The Judges appointed to decide on the relative merits of the Essays in the latter class, have not only awarded the prize to Mr. Bravender, as announced, but have "highly commended" four of the remaining essays; and the Council have received from Mr. W. Stace, of Berwick, near Lewes, Sussex, and Mr. John Arkell, of Hollow Farm, near Gloucester, the authors respectively of two of those Essays, their full permission for the Journal Committee to make any use of them, of which they may be found available in carrying out the objects of the Society, have ordered their thanks for such favour to be returned to those gentlemen accordingly.

There having frequently existed a doubt, how far it has been the intention of some of the writers of the Essays to enter into communication with the officers of the Society in reference to points of detail connected with their Essays, the Council have adopted the following recommendations of the Journal Committee on this subject :—

1st. "That competitors shall be required to inclose their names in a cover, on which only their motto and the subject of their papers, with the number of that subject in the prize list of the Society, shall be written.

2d. "That the Chairman of the Journal Committee alone shall be empowered to open the motto-paper of such Essays not obtaining the prize as he may think likely to be useful for the Society's objects; with a view of consulting the writer confidentially as to his willingness to place such paper at the disposal of the Journal Committee."

The following recommendation of the Journal Committee on the subjects and amount of prizes for the Essays of next year, has also been adopted by the Council, the conditions of which will be announced as usual in the Appendix to the next Journal; the Essays for these prizes being required to be sent to the Secretary on or before the 1st of March, 1845 :—

£10 : On the advantages of One-horse Carts.
£10 : On the best method of Fattening Cattle.
£20 : On the best method of Reclaiming Heath-land.
£50 : On the Agriculture of Nottinghamshire.
£50 : On the Agriculture of Cornwall.
£50 : On the Agriculture of Kent.
£20 : On the cheapest mode of Establishing a Tile-yard.
£20 : On Catch-Meadows.
£50 : On the Dutch method of Curing Butter.
£20 : On Fences.
£20 : For the best Experiment in Agriculture.

The General Southampton Committee have reported their arrangements for the Meeting of the present year at that town in July next; and the Council have ordered an extensive announcement of the Prizes to be awarded on that occasion, amounting to upwards of 1400*l.*, to be made, by publication in the Journal, by the distribution of Prize-sheets, and by advertisement in the public papers. They have the satisfaction of announcing, that the Implements entered for exhibition and trial at the Southampton Meeting, exceed by upwards of 130 the number of those at the Derby Meeting.

The Council have decided that the Annual Country Meeting for the North Wales district shall be held at Shrewsbury in 1845. The Council have unanimously appointed Messrs. Thomas Gibbs and Co., of Half-moon-street, Piccadilly, to be the Seedsmen to the Society. They have also entered into a satisfactory arrangement with the executor of the late Mr. Webb Hall, for the purchase by valuation of the library of the late Board of Agriculture, bestowed upon his father at its dissolution.

The Council think it desirable to state, in conclusion, that all their weekly meetings, excepting that on the first Wednesday of the month, are set apart for the reception and discussion of Agricultural communications; and that all members of the Society have the privilege of being present on those occasions. The experience which the Council have already had of the sound and practical suggestions made to them at those meetings, and the interesting discussions which have frequently arisen thereupon, induces them to invite all the members who may happen to be in London on the days of meeting, to avail themselves of this privilege; begging to assure them, that their attendance on such occasions will be as acceptable to the Council, as it is at all times uniformly desired.

By Order of the Council,
James Hudson, Secretary.

London, May 22, 1844.

On the motion of Mr. Parkes, seconded by Mr. Knight, this Report was received and unanimously adopted. Mr. Raymond Barker, Chairman of the Finance Committee, then read to the Meeting the following balance-sheet of the accounts from the 1st of July to the 31st Dec. 1843, as examined and approved by the Auditors :—

RECEIPTS.	£	s.	d.
Balance in the hands of the Bankers, June 30, 1843	1509	19	10
Do do. Secretary do.	1	6	4
Half year's Dividends on Stock	130	16	6
Life-Compositions of Governors	90	0	0
Do. Members	217	0	0
Annual Subscriptions of Governors	183	0	0
Do. Members	1124	3	0
Balance on Sale of Journal, after deducting the charge for stitching 16,000 Copies, and for amount of Advertisements	83	14	1
Sale of Cottage Tracts	9	6	6
Receipts, during the half-year, on account of the Country Meetings	896	14	3
	£4246	0	6

PAYMENTS.	£	s.	d.
Permanent Charges	260	12	6
Taxes and Rates	17	1	5
Establishment Charges	408	3	9
Postage and Carriage	12	12	10
Advertisements	13	10	0
Expenses of Printing and distributing the Journal	644	16	3
Prizes	1271	0	0
Miscellaneous Payments	24	5	11
Payments during the half year, on account of the Country Meetings	922	4	1
Balance in the hands of the Bankers, Dec. 31, 1843	657	11	8
Balance in the hands of the Secretary, Dec. 31, 1843	14	2	1
	£4246	0	6

(Signed) C. H. Turner, Charles Tawney, } Auditors on the part of the Society.
Thos. Raymond Barker, Chairman of the Finance Com.
C. B. Challoner, Henry Blanshard, } Members of ditto.

The President then requested the Chairman to favour the members present with an account of the present state of the Funds of the Society, and an estimate of the probable income and liabilities for the next three months; when Mr. Barker laid before the meeting the following statement accordingly :—The funded property amounted at that time to 7700*l.*; and the current cash-balance, at the disposal of the Society, to 2039*l.* The income for the next three months was estimated at 1613*l.*; the ordinary expenses during that period at 397*l.*; the prizes to be awarded at Southampton at 1400*l.*; and the excess of expenditure over receipts on that occasion at 1000*l.*; so that if a balance were struck three months hence, the Society would hold its invested capital untouched, with a probably correct cash balance of 855*l.* in the banker's hands. There was, however, a large bill on account of the printing of the past year's Journals, in progress through the Journal Committee, which would in due course come under the consideration of the Finance Committee; but whether the whole or any portion of that account would be ordered for payment during the next three months was uncertain. The rate of income was the greatest during the spring, and that of expenditure the greatest during the period of the Country Meetings; so that the income for the next three months proceeded under average and ordinary circumstances; while the expenditure with which it was compared took place under temporary and extraordinary circumstances. It was, therefore, the more gratifying to the Finance Committee to find the funds of the Society so well bear the severe test of such comparison.

On the motion of Mr. Pusey, M.P., the following gentlemen were unanimously elected Auditors on the part of the Society for the ensuing year :—Charles Hampden Turner, Esq., of Rook's Nest, Surrey; Alderman Tawney, of Oxford; and Thomas Knight, Esq., of Edmonton.

The President then congratulated the members on the rapid progress of the Society, and the flourishing condition of its affairs. He regarded it as effecting in a most satisfactory manner the various objects for which it was instituted. There was one point, however, which he had always considered as a blot on the accounts; and that was the large amount of the arrears of subscription. That subject, he was happy to say, had received the very mature consideration and diligent scrutiny of the Finance Committee, whose chairman had addressed to each defaulter a letter, drawing his particular attention to the subject; and the Committee had decided on the line of conduct to be adopted in the particular case of each class into which they had distributed such members in arrear. The Society had no wish to take any unfair advantage of any individual, who indirectly, and without knowledge of the liabilities of attaching himself to a chartered body, had become enrolled a member of the Society at the Country Meetings, and for the purpose only of being enabled, as a member, to be present at the public dinners of the occasion. But, on the contrary, in these cases, where deliberate election and payment of subscription had taken place with a full knowledge of the rule of the Society, and the due notice to be given on withdrawal, and had been followed by intentional neglect, or defiance of the regulations of the Society, the Committee have felt it their duty to recommend, as stated in the Report just read, the most deliberate measures to be taken and followed up for the recovery of the arrears. In enforcing the payment under such circumstances, he thought it quite fair and proper to proceed under the powers of the Charter against such defaulters. He still, however, hoped that extreme measures might remain uncalled for; as he felt assured that the members in arrear, on being made sensible of the undoubted legal claim and power the Society possessed in a Court of Law, would at once pay what was due. Under such a system, he had no doubt that the finance of the Society would rapidly assume a better form, and the blot of its apparently enormous arrears be wiped away from its accounts. From his intimate connection with the Society from its commencement, he had always been most anxious for its welfare; and it was a subject of sincere pleasure to him, at the end of the sixth year of its existence, to witness its continued prosperity, and to find, at the end of every year, that the more it has hitherto done, the more it has still to do. He earnestly trusted that it would continue to go on in the same prosperous state, and prove a national benefit to the farmers and all persons engaged in the cultivation of the soil.

The President announced the preliminary Schedule of Prizes for 1845, to be awarded at Shrewsbury, and of which copies were then laid in proof, to receive the suggestions, corrections, and additions of the Members, to be taken into final consideration by the Council in the last week of June, 1844; previous to which time the President requested the favour of all such remarks for the guidance of the Council to be forwarded to the Secretary, in writing, for such purpose.—The Rev. J. R. Smythies objected to the class for animals of any but the three pure and recognised breeds; and recommended, accordingly, that the fourth division of the classes of prizes for half-bred animals should either be expunged altogether, or the prizes reduced greatly in their amount; he considering it to be a great anomaly to set aside an amount for such animals equal to that assigned for the pure bred stock.

The President remarked that the division to which the Rev. Mr. Smythies had alluded, did undoubtedly admit cross-bred animals; while, however, the Society in their prize-sheets encouraged the selection of pure bred animals of the best breeds; they were also desirous of admitting to competition for their prizes animals of those breeds which maintain a great reputation among the farmers of their respective neighbourhoods. Every locality had some breed that was considered particularly good, and he therefore thought it unfair, when the Society held their successive meetings in such parts of the kingdom not to encourage these local breeds, and give them an opportunity of competing for the prizes in such miscellaneous class as that hitherto adopted by the Society. Although he agreed in the general principle contended for by Mr. Smythies, he thought it would be unjust towards the Shropshire cattle, well known to be of a good and useful kind, to exclude them at the Shrewsbury Meeting. Mr. Hillyard said, that the short-horns and Herefords were superior to every other breed in the world, no doubt; but they required good pastures, and there were localities in this kingdom suited to neither of these breeds; he therefore trusted that the particular breeds best suited to particular localities should continue to be encouraged by the Society.

The Duke of Richmond suggested that prizes for cheese should not be forgotten at the Shrewsbury Meeting, as prizes belonging to the dairy character of the district. The further consideration of the Prize-sheet was then postponed. The Duke of Richmond proposed the best thanks of the Society to be given to Earl Spencer, the President, for his conduct in the chair that day, and for the anxiety he had evinced on every occasion to promote the prosperity of the Royal Agricultural Society of England. Lord Spencer was so well known and estimated by the members of that Society, that it was not necessary for him to detain the meeting with any eulogy on his merits.

Mr. Raymond Barker seconded the motion. He had had the good fortune, during the last six years, to be a fellow-worker with Lord Spencer in attending to the business of the Society; and he stood forward on that occasion to bear his testimony to that noble lord's uniform devotion to whatever he undertakes for the public benefit, and especially for the Royal Agricultural Society of England. The motion was then put by the Duke of Richmond, and carried by acclamation. Earl Spencer, in returning thanks for the manner in which the members had received the proposition just put to them by his noble friend the Duke of Richmond, declared his sincere desire to further by every means in his power a Society so beneficial in every respect to the country.

The President then left the Chair, and the meeting broke up.

[The length to which our present Report of the proceedings of the General Meeting extends, induces us to postpone the continuation of the discussions of the last Council to next week, when we shall be enabled to resume our notice of those interesting topics.]

Errata in Report of Mr. Parkes's remarks in our last, page 325: for "washed," read "roasted;" for "Graham," "Graburn."

HIGHLAND AND AGRICULTURAL SOCIETY.

At the last monthly meeting of the Society Mr. Dewar read an essay by Mr. John Taylor, farm overseer at Corsietown, near Huntly, on the comparative merits of reaping Corn with the scythe and sickle. Mr. Taylor first considers the comparative merits of the implements in reference to the processes of binding, winning, carrying, stacking, and thrashing the crop. In regard to binding, a man can bind and stook 1500 sheaves, cut by the scythe, in 10 hours, as easily as he can bind 1200 sheaves cut with the smooth or serrated sickle: the chief reason for the difference being in the circumstance of the binder to the mower having his work straight before him, without having to move from one ridge to another. It is allowed on all hands, as remarked by Mr. Taylor, that mown sheaves win in about one-fourth less time—that is, in 9 days, instead of 12—than those cut with the sickle, though there is no perceptible difference in winning

between Grain cut with the smooth and toothed sickles. As to leading and stacking, mown sheaves are closer in the head than shorn, and on this account less Grain is lost by shedding while being carted; and as a stack built of mown sheaves is more open than one of sheaves shorn with sickles, the grain and straw in it not only win sooner, but on that account may be carried with safety from the field in an imperfectly dry state. It is allowed that a stack of mown sheaves has a rougher appearance than one of sheaves cut with the sickle, and that it exposes a greater number of heads of grain to the weather and the depredations of birds; but this difficulty is easily overcome, as a man can dress a stack with a scythe-blade in an hour. It is admitted that shorn sheaves are thrashed about 10 per cent. faster with the flail than mown ones; but as that implement is now in very limited use in Scotland, and as a good thrashing-machine is equally effective and expeditious with sheaves cut in either way, this objection is of little importance. Another question of moment in using the sickle and scythe is the quantity of work performed by each, and its cost. The following are the results of Mr. Taylor's experience in the employment of 7 harvest labourers connected with the operation of each implement, viz., with the scythe, 2 mowers, 2 gatherers, 2 binders, and 1 raker; and with the sickle, 6 reapers and 1 binder:—

	Of Wheat. A.	R.	P.	Of Oats or Barley. A.	R.	P.
By the Scythe.....	2	3	0	4	0	20
.. Smooth Sickle	1	1	18	2	2	10
.. Toothed Sickle	1	0	8	2	0	10

From these results, the advantage from the use of the scythe is obvious. According to a statement given by Mr. Taylor, it appears that the cost of mowing is about 4s. per acre—a sum considerably less than the expense incurred by either kind of sickle. Mr. Finnie of Swanston then read a report of experiments made by Mr. Lumsdaine of Lathallan, in Fifeshire, with various fertilisers, on different crops. The crops experimented on were Oats, Barley, Wheat, Tares, Pasture, young Grass, Potatoes, and Turnips. The articles experimented with were farm-yard dung, foreign guano, Johnston's artificial guano, nitrate of soda, sulphate of ammonia, bone-dust, rape-dust, sulphate of soda, chloride of sodium, and gypsum. The following are some of the conclusions which Mr. Lumsdaine has given. *Oats.*—In respect of this article of produce, it is observable that the nitrate of soda gave 608 lbs. more grain and 82 lbs. more straw per Scotch acre, and the sulphate of ammonia 672 lbs. more grain and 118 lbs. more straw after a hay crop, at less than half the expense of farm-yard manure, renewed after Turnips; thus proving the great superiority of both these fertilisers, but especially of the ammonia. It farther appears that the ground in a natural state after hay is much more beneficially acted upon by these mineral fertilisers than by the higher order of animal manures after a Turnip crop. *Barley.*—Here the Rape dust beat the farm-yard manure by an excess of 424 lbs. of grain, and 51 lbs. of straw, whilst the artificial guano and nitrate of soda maintained an equal efficacy, but from the expense attending these being only 2-5ths of the cost of Rape-dust, the preference is due to them. *Pasture.*—Here it is quite problematical whether the earlier progress of the pasture by 10 days would, in upland and late districts, be sufficiently compensatory, supposing the outlay to be essentially necessary, in consequence of the expenditure of the winter keep. *Young Grass for Hay.*—The conclusion here follows that the sulphate of ammonia might be profitably employed as a top-dressing in preference to nitrate of soda, and from its earlier advance of the pasture by 12 days than the patch which got nothing, the aftermath would be sooner available and more productive. *Potatoes.*—The inference in this case is, that the patch with the farm-yard dung, and sulphate of soda, and chloride of sodium, takes the lead. Next, that with the farm-yard manure by itself. Then those with Johnston's artificial guano and farm-yard dung, and farm-yard dung with rape cake; and last of all the two portions with the foreign and artificial guanos by themselves, which are nearly equal in merit with reference to cost and produce. *Turnips.*—Under this head the great superiority of the foreign guano is particularly prominent in the production of 530 stones more bulbs than from farm-yard dung alone, at little more than half the expense. Next comes the mixture of dung with foreign guano, yielding 357 stones more than dung alone, at an expense of a guinea less per acre. Then follows the combination of dung and bone-dust, giving 97 stones more than dung alone, at 14s. less money. The bone-dust by itself comes next, followed by the artificial guano by itself also, and in combination with farm-yard dung. The Rape dust with nitrate of soda and chloride of sodium, may safely be repudiated, both from the scantiness of the produce and the expense incurred. —Dr. Macdonald then read a paper by Mr. Robert Boyd, Innerleithen, Peeblesshire, On the Prevention of the Curl in the Potato, and on the best Method of keeping Potatoes intended for Seed. Mr. Boyd says that he has been more troubled with the curl in the Potato than any other disease to which the plant is liable. For 10 years a portion of his garden invariably produced curled Potatoes, although the seed was annually changed, and not unfrequently the manure itself. On examining the tubers of the curled plants, he invariably found them affected with the wire-worm, or a small slug or snail, and although he dusted the sets with quick lime, not a single plant was produced free of curl. He next dipped the sets in a mixture of salt and water, and dusted them with quick lime, and though the crop fell far short of an average, it was nearly double of that produced by the sets not dipped in the saline solution. Next year, on the sets being dipped in a solution of lime, salt, and water, they gave a satisfactory result, both in regard of freeness from disease and extent of produce. As to keeping Potatoes for seed, Mr. Boyd tried the planting of Potatoes which had unintentionally been left in the field all winter, in comparison with those which had been pitted in the usual way, the seed, the soil, the manure being alike; and the result was that the plants from the sets which had been left in the soil all winter were hoed before those from the pitted Potatoes appeared above ground, and they also ripened 14 days earlier, and produced nearly a fourth part more of crop. In consequence of this result, Mr. Boyd left some Potatoes in the drill all winter, which he intended for seed, only protected from the frost by a little rough dung sprinkled upon the ground; and he also made a pit of about four feet in diameter of the same kind of Potato which had been left in the drill, the pit consisting of a layer of Potatoes and one of earth alternately, and covered in the usual way. In the spring of 1841, the Potatoes in the pit seemed well preserved, though not so juicy as those left in the drills. On both being planted, the sets from the drills germinated some days earlier, were sooner ripe, and produced a heavier crop than those pitted in the usual way. Latterly, Mr. Boyd tried keeping his seed Potatoes in trenches six inches deep, strewed with salt and covered with rough dung. The Potatoes were taken out fresh and unsprouted in the spring, and the plants from them were equal to those raised from seed kept in the drill all winter.

ROYAL INSTITUTION.

May 17.—Lord Prudhoe, President, in the chair. The Rev. E. Sidney gave a communication On the Diseases of Wheat. Mr. Sidney commenced by stating, that though these evils were but too well known, their causes, as well as the mode of remedying them, had as yet been little investigated. Mr. Sidney then mentioned, that the diseases of Wheat arise, either from parasitic fungi, from insects, or from a yet unascertained cause. Of the parasitic fungi, the Uredo fœtida, or caries, commonly called bunt, or pepper-brand, attacks the grain, of which it fills the interior. It is recognised by its disgusting odour; it is supposed that one grain thus diseased may contain 4,000,000 of its spores, each $\frac{1}{1000}$ of an inch in diameter. These burst, and emit a cloud of sporules, which are absorbed during the germination of the seed. As these sporules adhere to the seed by an oily matter, the dressing by which they are cleansed should be alkaline, so as to convert this adhesive substance into soap, and then wash it off. Mr. Sidney recommended for this purpose lime, matters containing ammonia and potass, instead of sulphate of copper or arsenic. The Uredo segetum, the fungus next named, attacks the flower and its pedicel; it is called smut, or dust-brand. Its spores are smaller than those of Uredo fœtida, and it has no odour, but cattle reject straw infected by it; clean seed is the best remedy, but its extreme minuteness renders it difficult of removal, the spores being $\frac{1}{2800}$ inch in diameter. Mr. Sidney then described another fungus, Uredo rubigo, or Uredo linearis, commonly called robin-rush, red-rag, or red-gum, as attacking chaff, scales, and leaves; he stated, however, on the authority of Prof. Henslow and others, that this fungus is only an imperfect form of Puccinia graminis, or mildew. This fungus appears in the straw in sori, or patches, consisting of multitudes of Pear-shaped spores filled with sporules. As these patches originally appear in the cavities beneath the stomata, it is inferred that they enter them with the moisture they inhale, but are not taken up by the roots. As a remedy for this destructive disease, Mr. Sidney proposed the amendment of the soil, where too retentive of water, to air it well by exposure and freedom from weeds, to repress an over-luxuriance of vegetation, not to manure immediately before Wheat, and to select early varieties in places liable to mildew. In closing this part of his subject, Mr. Sidney demonstrated, from a highly magnified drawing of the Æcidium berberidis, that it was a vulgar error to imagine that the Corn-mildew was produced by the Berberry. But he admitted, that the Wheat might be injured by the odour of the Berberry flowers, or by the ingredients of a soil favourable to that plant. The rev. lecturer then proceeded to injuries inflicted on Wheat crops by insects. He noticed, that about 9 o'clock in the evenings of the month of June, myriads of a two-winged fly, the Cecidomyia tritici, or black midge, appear on the Wheat flowers. The larvæ of this fly cause abortion, so that the grain ceases to advance. It is imagined that the chrysalis is bred on the straw-heaps before the barns. A check to the rapid increase of this fly is providentially provided in two or three species of ichneumon, which feed on the chrysalis; still it is sufficiently abundant to destroy sometimes as much as one-third of a Wheat crop. The remedy against this is in the use of a sieve, of sufficient size to let dust and chrysalides through, and then to burn the refuse at a distance from the barn. This process affords the additional advantage of destroying many injurious seeds. Mr. Sidney mentioned that this plan had been successfully tried for two years on a large farm in Norfolk. That wonderful insect, the Vibrio tritici (ear-cockle, or peppercorn) was next mentioned; it attacks the grain. These extremely minute animalcules enter the stalk from the earth. They turn the grain first green, then black, and round, while the husks and chaff open, and the awns become twisted; 50,000 of these vibrios, according to Professor Henslow, weigh a grain. They will live six or seven years dried up in the seed. The remedy suggested is to steep the seeds in water, hot enough to destroy this insect, but not to injure the germinating power of the seed. The last disease noticed was that of the ergot: it is common in Rye, but more frequent in Wheat than is generally supposed. All that can be said of it in the present condition of our knowledge is, that it is a monstrous state of the seed, which in that condition burns like resin. The ergot of Wheat is more intensely poisonous than that of Rye, the qualities of which are well known. It grows freely in clayey, wet soils, and was last year prevalent in Darnel, and several other Grasses. Hence the diseases in cattle may have originated. Mr. Sidney's discourse was illustrated by diagrams, executed by Professor Henslow, and by examples of the various morbid appearances of diseased Wheat.

Miscellaneous.

Manure Tanks.—We understand that the Earl Fitzwilliam has intimated to his tenantry, that he will pay half the expense of providing tanks for containing liquid manure, on the several farms held under his lordship. It would be well if other landlords would follow the noble lord's example.—*Doncaster Gazette.*

Experiments with Manures.—We have in the two following experiments a decided proof of the superiority of bone and guano as fertilisers, compared with dung:—Experiment No. 1.—A trial between bone dust and Truro scavengers' dung, by Mr. George Mason, on Roseveth farm, in Kenwyn, on a crop of White Turnips, calculating the price of the dung at 4s. per load—the increased consumption of bone and guano having very materially lessened the use of this article, and consequently its price.

Dung, half-acre.	£	s	d
15 loads of dung from Truro, at 4s. per load	3	0	0
Expense of carriage 3 miles	1	17	6
Expenses of spreading the dung on the land	0	15	0
	£5	12	6

Bone, Half-acre.	£	s	d
1½ qrs. of bone-dust	£1	14	6
Carriage of ditto	0	1	6
Broad-casting, &c.	0	1	0
	£1	17	0

The crop was equal, being about twenty tons to the acre; but the difference in the expense was so considerable that the farmer could have cultivated three acres with bone at the expense of one with Truro town-dung. The estate is situated in a poor district, having a south-east aspect, and lies on the clay-slate; valued about 18s. per acre. Experiment No. 2.—Between dung, bone, and guano, as fertilisers for Grass and Hay, was instituted on land farmed by the Earl of Falmouth, in the present year, by Mr. Rope, upon a piece of permanent pasture, which had not been ploughed up for fifty years. The field had alternately been mown and grazed during this period, and had received no dressing, in the shape of dung, for the last ten years. The soil is a heavy loam, resting on a clay-slate subsoil, having a northern aspect. Three half-acres were carefully selected, measured and manured, on the 24th of March—the Hay cut on the 10th of July, and weighed on the 15th. The result will be seen in the following table:—

Manures, per half acre statute.	Cost of manures, including carriage.	Weight of new hay per statute acre.	Value of hay at 30s. pr. ton	Profit.	Loss.
	l. s. d.	tons. cwts. qrs. lbs.	*l. s. d.*	*l. s. d.*	*l. s. d.*
15 loads of Plymouth dung	4 8 0	1 8 0 0	2 2 0	..	2 6 0
10 bushels bone-dust	1 12 0	1 2 2 0	1 13 9	..	0 1 9
134 lbs. of guano	0 17 0	1 12 3 0	2 9 0	1 12 0	..

Here we have a decided loss on the part of the Plymouth dung, which consists of the sweepings of Plymouth streets, night-soil, rubbish, &c., of 2*l.* 6*s.*, and a decided gain on the guano of 1*l.* 12*s.* per half-acre. There cannot be a question after this and the other experiments which I have related, that guano is a most astonishing fertiliser; still this experiment, valuable as it is, is incomplete, till we see the effect of these manures on the next year's crop, which should be grown without manure, and cut and saved in the same careful manner. The after Grass was very good on each of the pieces, the cattle preferring the part manured with bone. Mr. Rope tried the guano in various ways. On a piece of ground adjoining, he sowed double the former quantity per acre; and on some young Clover also a similar quantity, and the rapid growth of each was extraordinary. The spots where guano was applied could be distinguished at a great distance. In another instance he dressed half an acre of Barley, with which fifteen sorts of Grass-seeds, and three of Clover, had been sown, and at the present period they are looking remarkably well; there was also an increase of about eight imperial bushels of Barley per acre, compared with other parts of the field. I mention this circumstance connected with the seeds, in consequence of its having been stated that guano is injurious to Clover and young Grasses. The next experiment to which I would direct your attention, was a trial between bone and guano, also made by Mr. Rope, of Tregothnan. Upon a field of five acres in Swede Turnips, which was of a very inferior description, valued at 10s. per acre, a mixture of 15 loads of farm-yard dung, and 5 loads of calcareous sea-sand (the coralline deposit found in Falmouth harbour), and 22 loads of soil taken from the ditches, was laid per statute acre—at a cost, including carriage and spreading, &c., of 4*l.* 2s. Three acres dressed in this manner were measured out—one of them having 2½ cwts. of guano, and another 2½ quarters bone dust extra. The seed was of the purple top variety, and was drilled in at 18 inches distance, on the 15th of June. The difference between the acre which was simply dressed with the dung, sand, and earth, compared

with the two acres dressed with bone and guano, was as follows :—

Manures.	Value of manures per acre.	Weight of crop per acre.	Value of crop per acre, at 8s. per ton.	Difference between crop and manures. Profit.	Loss.
	l. s. d.		*l. s. d.*	*l. s. d.*	*l. s. d.*
Dung, sand, &c.	4 2 0	7 tons.	2 16 0	.. ..	1 6 0
Dung, sand, &c.	4 2 0				
2½ cwt. guano	1 14 0				
	5 16 0	22 tons.	8 16 0	3 0 0	.. ..
Dung, sand, &c.	4 2 0				
2½ qrs. bone	3 0 6				
	7 2 6	25 tons.	10 0 0	2 17 6	.. ..

In this experiment, the advantage is decidedly in favour of bones, since there cannot be a doubt but that the next crop will derive a much greater benefit from them than from the guano. This experiment is chiefly valuable in proving that had it not been for the outlay in these manures, the crop would never have paid for the dung and sand. The next experiment was also a trial between bone and guano, giving the advantage to the latter. It was made by Mr. C. Parks, of Michell. The field was a Wheat stubble manured for that crop with a compost of dung, earth, and sand. When put into Turnips, one part was manured with bone-dust at the rate of 3 quarters per acre, the other part with guano at the rate of 2¼ cwt. per acre. The following calculation was made by selecting an average statute yard of Turnips grown with each of these manures, and the result was as follows :—

Manures.	Cost of manures per acre.	Produce per acre.	Value of crop at 8s. per ton.	Difference between crop and manures.
	£ s. d.	Ton. cwt. qr. lb.	*£ s. d.*	*£ s. d.*
3 qrs. bone ..	3 12 0	15 4 1 4	6 1 6	2 9 6
2¼ cwt. guano	1 10 0	21 15 2 24	8 14 3	7 4 3

I have made as few remarks as possible on the effect of the different manures which we have passed in review, leaving the experiments to speak for themselves; but in this last one, it must be understood that the land was of a heavy loamy character, which is more suitable to the use of guano than bones. The next experiment was one between bone-dust, Peruvian guano, Potter's artificial guano, and bone-dust and Peruvian guano mixed, instituted on a crop of Swedes, on Trelowarren estate, by Mr. Foot, the hind of Sir R. R. Vyvyan, Bart. The land is of a loamy description on a clay-slate subsoil, having a north-west aspect :—

Kinds of manures.	Quantity of manures per acre.	Price of manures per acre.	Weight of Turnips per statute acre.	Price at 8s. per ton of crop per statute acre.	Difference between prices of manure and crop.
		£ s. d.	tons. cwts.	*£ s. d.*	*£ s. d.*
Bone-dust . .	2½ qrs.	2 12 6	23 8	9 7 3	6 14 9
Peruvian guano .	350 lbs.	2 2 0	25 .	10 0 0	7 18 0
Potter's guano .	350 lbs.	2 9 0	22 .	8 16 0	6 7 0
Bone-dust and Peruvian guano	1½ qrs. 175 lbs.	1 6 3 1 1 0	26 .	10 8 0	8 0 9

From this experiment we see that the bone-dust and guano mixed, gave the heaviest crop, and yielded the largest profit per acre.—*From Mr. Karkeek's Prize Essay on Artificial Manures.*

Notices to Correspondents.

RURAL CHEMISTRY. By Edward Solly, Esq., F.R.S., Experimental Chemist to the Horticultural Society of London, Hon. Mem. of the Royal Agricultural Society, and Lecturer on Chemistry at the Royal Institution, has been reprinted from the *Gardeners' Chronicle*, with additions, and may be had of all booksellers, price 4s. 6d.

BOOKS.—*H. F.*—"The Harleian Dairy System, and An Account of the various Methods of Dairy Husbandry pursued by the Dutch." Apply to your bookseller.

BUTTERCUP.—*Subscriber.*—Try pasturing your park with geese.

FOOD FOR COWS.—*A Lady* will probably find that her quarter of an acre will produce more and better winter food for cows, by sowing half of it to Carrots, and half to Mangold Wurzel, than by any other way of cropping it. Rather less than half might be sown to the latter crop, and the difference might be sown to Parsnips. It is very late for all these crops, but if the land be in fine order, they may succeed yet, if particularly looked after.

CHARRING PEAT.—*An Old Subscriber.*—Probably next week.

DISTEMPER IN DOGS.—*J. Mc I.*—It consists of a specific inflammation of the mucous membranes, particularly that lining the nostrils, throat, and windpipe. It is often fatal; but probably more dogs die of the *remedy* than of the *disease*. There is no infallible cure; it requires as much care and adaptation of treatment as any disease to which animals are liable. If there is any costiveness, give from half a grain to two or three grains, each of viz.:—Chloride of mercury and potassia, tartrate of antimony, with milk, or on a little meat, but refrain from this medicine if there is either purging or much sickness. Afterwards the following pill may be given twice a day:—Digitalis, 1 to 2 grains; antimonial powder, 2 to 4 grains; nitre, 4 to 8 grains, for two or three days. When the discharge from the nose is considerable, or there is much weakness, give the following pill twice a day:—Gentian, 10 to 20 grains; ginger, 5 grains; cascarilla bark, 10 to 20 grains. If there is purging or vomiting, add from ½ to 2 grains of opium till these symptoms cease. If the nasal discharge is offensive, give daily a tea-spoonful of yeast. If the brain appears affected, put a seton in the poll and in the loins; if there is paralysis or weakness, give broths and nutritious food, warmth, and care, and modify the treatment according to the symptoms. *W. C. S.*

LIQUID MANURE.—*P.*—Vegetable mould of the right kind is a fixer of ammonia, on account of the humic acid which it contains. Muriate of ammonia is a fixed salt. But if you spread urine which has already had its urea converted into carbonate of ammonia, by putrefaction, on a vegetable soil, though it be of the best kind for fixing ammonia in this way, a considerable immediate loss must take place by evaporation. If you apply it fresh, and rake it in, probably no other precaution would be necessary. If it is inconvenient to give daily attention to the matter in this way, or if your soil is not, as Sprengel calls it, a humic soil, then you had better make a sufficiently large tank, put in many gallons of water, and a few of sulphuric acid, to begin with; and always add more acid whenever putrefaction commences, which may be ascertained by smell, and by the effervescence which follows the addition of acid. ——*Ns. Cm.*—You had better add the sulphuric acid till effervescence ceases, stirring the mixture up all the while with a long pole, or something of the kind. Dilute the acid with two or three volumes of water before using it. You may apply the compound to Grass at once, provided you have not put too much acid in, which you will know by seeing if the liquid will redden litmus-paper. If too much acid has been added you will have to wait till such additional quantity of urine has been added as will neutralise it. The sulphate of ammonia formed will be in solution, but there will also be a sediment of various matters, worth making use of as manure.

MANURE.—*Ignotus.*—Peaty or black earth will act as an absorbent of the gaseous emanations from a dung-heap, and you may in a measure fix the volatile part of urine with it. The sand you send will not do it. Your Mangold Wurzel, though sown late, will succeed if the land is in good order, and the weather prove propitious. Your proposed application of soot will probably be beneficial; but for a statement of the partial or special effects of the manure, and others of its kind, see previous Papers.——*B. L.*—When animal matters are boiled in alkaline solutions, their value as manure is diminished; a quantity of nitrogen is lost in the form of ammonia. The substance obtained by the process you describe, would, no doubt, be a good manure; but a large part of the nitrogen would be wasted. The process of drying would not of itself be likely to injure the manure. *E.*

MOWING YOUNG WHEAT.—*C. L.*—We shall notice your letter next week.

NITRATE OF SODA.—*I. V. B.*—A skilful sower will scatter 1 cwt. per acre uniformly. If it be mixed with twice or thrice its weight of dry mould, it may be scattered evenly by a bone-dust drilling machine, and then you may in effect broadcast it by fresh harrowing across the drills. Perhaps the best way to scatter it evenly, is to dissolve it in water, and use the water-cart. You can put your Wheat in, by working the Clover-root with the scuffler twice crossing, and then ploughing, harrowing, drilling the seed, and harrowing again.

STALL-FEEDING.—*S. L.*—You will be able to keep more stock on your land than you name, if you choose, provided you cultivate your land as you should (it is of so small an extent) with the spade. Supposing that you have 8 pieces, sow 2 to Wheat, and on one of them sow Clover. Immediately after harvest, break up the stubble of the other, and sow Vetches; digging in manure, and making the land as rich and friable as possible. These will be ready early in spring. As you mow them, and carry them to your horses and cows, dig up the land every day, and plant Potatoes. You may plant another piece to Potatoes besides this, and earlier; plant also 1 acre (2 pieces) to Carrots—a portion the Early Horn, and the rest the White Belgium—and ¼ an acre (1 piece) to Mangold Wurzel. Your ground in spring will be thus; 2 pieces Wheat, 1 piece Clover, 1 piece Vetches—to be afterwards planted to Potatoes, 1 piece Potatoes, 1 piece Mangold Wurzel, and 2 pieces Carrots. You will find that, with your hay and these roots, &c. you will be able to keep much more stock than what you say, and you will then be able to turn the laugh at those who now joke you about your book-farming.

TANKS.—*Cockney.*—You had better have your tank out of the stable. It would do well enough in-doors, but as you propose using sulphuric acid, you might be exposed to the hazard of your cattle getting a foot in occasionally. We do not know anything of the prepared Indian-rubber flooring, except that the area in front of the Admiralty is paved with it, and that, in that place, it seems at present to answer the purpose. One thing that gives it value in London is that it effectually deadens sound. Horses do not much like it at first. You had better use paving-stone or bricks for your purpose.

WEEDS.—*J. G.*—Try liming your land; it will sweeten the Grass. You cannot get rid of particular Grasses by the use of any particular manure; but by drying your land and sheeping it, you may gradually destroy aquatic weeds and annuals.

***As usual, many communications have been received too late.

Markets.

MARK-LANE, MONDAY, May 20.

THERE was a fair supply of English Wheat from the near counties this morning, but it met a slow sale, at prices barely equal to those of last week, particularly the secondary qualities, of which some proportion remained undisposed of at the close; in old Foreign a moderate business was transacted, and also such parcels of new as were in good condition at our late quotations, but the inferior continues very unsaleable, although offered rather lower. —English and Foreign Barley are unaltered in value, but the latter meets an improved inquiry.—Beans are 1*s.* dearer.—Peas remain as last quoted.—Oats meet a better demand, and in some instances a trifling advance is obtained upon the finest qualities.

FRIDAY, May 24.

During the week the arrivals of grain have been small; notwithstanding which, great difficulty is experienced in disposing of the English Wheat left over from Monday, at that day's prices. In Foreign there was a moderate business only; a cargo or two of the foreign arrivals were disposed of in bond at their free value less the duty.—Beans and Peas are fully as dear.—English Barley is unaltered, but the foreign meets an improved demand, and such parcels as are adapted for Malting command an advance of fully 6*d.* per qr., good sweet 53lbs. Pomeranian f. o. b. was also inquired. —Oats sell freely, and a slight advance is obtained upon the inferior and middling descriptions.

KINGSFORD AND LAY.

HOPS, FRIDAY, May 24.

THE high winds and extreme cold nights at the end of last and beginning of this week have much checked the Hop bines, causing them to look yellow and unkind, whilst the fly continues rapidly to increase, which causes many experienced planters to anticipate as severe a failure as in 1840; our Market, in consequence, keeps advancing.

PATTENDEN & SMITH, Hop-Factors.

WOOL.—BRITISH, FRIDAY, May 24.

WE cannot report any alteration in our English Wool Market since our last. Very little of the new clip as yet has made its appearance.

JAMES PERRIN, Wool Broker.

COVENT GARDEN, MAY 25.—The Market has been well supplied during the week, but many of the articles offered are rather inferior in quality, owing to the long continuance of dry weather. This is particularly the case among Vegetables; Fruit, generally speaking, is good. Pine Apples are rather more plentiful, and are in consequence somewhat reduced in price. Grapes are excellent, especially the Black Hamburgh, of which we noticed some fine bunches with beautiful large well-swelled berries. Some good white Grapes are also in the Market. Peaches and Melons have been offered; the latter are large, and good in quality. The best Cherries are selling at about 18*s.* per lb. Apples and Pears are scarce. Gooseberries are plentiful, and are cheaper. Good Oranges are becoming scarce. Strawberries of good quality are to be met with in the market; they are getting more plentiful. Among Vegetables, Cauliflowers are rather scarce, and they are small in size. Broccoli, as well as Carrots and Turnips, is much affected by the drought. Seakale is very scarce; Rhubarb is sufficient for the demand. Asparagus is a little advanced in price; French Beans bring from 2*s.* to 4*s.* per 100. Peas are supplied in large quantities, and they are also a little reduced in price. Lettuces and other salading are plentiful. Cucumbers are cheap, but they are for the most part small in size. Among Cut Flowers we noticed Erica vestita alba, E. hybrida, Chorozema varium, Gloxinia rubra, Polygala oppositifolia, Gardenia radicans, Epacris impressa, Pelargoniums, Fuchsias, Lily of the Valley, Calceolarias, Verbenas, Cinerarias, Pansies, Moss, Provence, and China Roses.

FRUITS.

Pine Apple, per lb., 6*s* to 10*s*
Grapes, Spanish, per lb. 1*s* to 1*s* 6*d*
Hothouse Grapes, 4*s* to 10*s* per lb.

Chervil, per punnet, 2*d* to 3*d*
Cauliflowers, 6*s* to 24*s* per doz.

POTATOES.—SOUTHWARK WATERSIDE, May 20.

THERE has been a considerable change in the weather since our last Report; the earlier part of the week was as hot as usual, but the end was stormy and cold, but without rain; notwithstanding, the Town markets were well supplied with vegetables, selling at moderate prices. At the Waterside Potato Market the same inactivity prevailed, and it was with difficulty that the late quotations could be maintained for the best samples; and the old disease of the dry-rot was visible in many samples, and especially in the Scotch Reds, causing the buyers to be limited in their purchases of second-rate qualities. Foreign Potatoes are still in the market, selling at prices previously quoted. During the past week there have been supplies from most of the shipping districts, which are fully equal to the demand.

SMITHFIELD, MONDAY, May 20.—Per stone of 8 lbs.

Best Scots, Herefords, &c.	3*s*	8	to	4*s*	0	Best Downs & Half-breds	3*s*	8 to 4*s* 2
Best Short Horns .	3	6		3	8	Best Long-wools .	3	8 4 0
Second quality Beasts .	3	0		3	4	Ewes and second quality	3	4 3 8
Calves	4	4		5	0	Pigs	3	4 4 0
Lambs	5	0		6	0			

Beasts, 2701; Sheep and Lambs, 29,550; Calves, 125; Pigs, 370.

Our supply of Beasts to-day is very moderate, the trade is brisk, and everything readily sold at the above quotations; in some few instances the very best Scots have made a little over 4*s*, and the most selling Short-horns nearly 3*s* 10*d* per 8 lbs. We have again a very fair supply of Sheep and Lambs, but the demand is quite adequate to it; indeed, we notice a considerable advance on last Monday's quotations, fully 4*d* per 8 lbs, the best Downs readily making 4*s* 2*d*, and the most selling Longwools 4*s*. Good Lambs is rather in demand, and fully supports former rates. Pork-trade is a little better. Veal-trade is very brisk, at an advance of about 4*d* per 8 lbs.

FRIDAY, May 24.

Notwithstanding a very limited supply of Beasts, an extreme dulness pervades the trade. Monday's prices are barely maintained: the best Scots hardly make 4*s*, and the best Short-horns scarcely 3*s* 8*d* per 8 lbs. Sheep are not very plentiful, still, a slackness of demand causes us to submit to a reduction of fully 2*d* per 8 lbs, the best Downs making no more than 4*s*, and the best Longwools hardly 3*s* 10*d*. The late increased demand for Lamb has brought a large supply of that article to our Market to day, and the trade for it is quite overdone; we notice a large proportion is of very middling quality, and cannot be sold; the very best qualities are still in moderate supply, and realise about 5*s* 8*d* per 8 lbs. Veal trade is rather worse, the best cannot be quoted at more than 4*s* 8*d*. Pork, also, is lower.

Beasts, 661; Sheep and Lambs, 12,230; Calves, 351; Pigs, 360.

41, West Smithfield.

WRIGHT'S STACK PRESERVER.—Hundreds of Stacks of fine Hay were saved from spontaneous combustion or discoloration in the neighbourhood of the inventor, by the use of the above invaluable instrument. The article may be seen, and bills obtained, containing testimonials to its value from experienced Farmers who have for many years proved its efficacy, at J. WRIGHT'S, Manufacturer, Ongar, Essex; J. and G. DEANE, Ironmongers, London-bridge; and of any Ironmonger in the country. Price, in box, with lock and joints, 2*l.* 5*s.*

IMPORTANT TO AGRICULTURISTS AND OTHERS.

ANALYSES OF SOILS, MANURES, &c. are conducted by MR. MITCHELL, Analytical Chemist (late of the Royal Polytechnic Institution), No. 5, A., Hawley Road, Kentish Town.

N.B. Gentlemen instructed in Agricultural Chemistry. The course will comprehend the Elements of Analysis.

MOST IMPORTANT TO FARMERS AND GRAZIERS.

GIBBONS' DISINFECTING OINTMENT, a most effectual and perfect cure for Epidemic and Foot-rot in Sheep; also for Epidemic and Foul in Cows' Feet, and for the Grease and Thrush in Horses; prepared only by HENRY GIBBONS, Agricultural Chemist, Wolverhampton.

This Ointment effectually destroys the American grub on Fruit-trees. Sold by all respectable Druggists in Town and Country, in packets at 2*s.* 6*d.* each. Mr. William Bailey, Manufacturing Chemist, North Street, Wolverhampton, is appointed Sole Wholesale and Shipping Agent.

DR. HALLETT'S LIQUID FERTILISER.—The beauty of Flowers, with their power of perfecting their Seeds, and the flavour and size of Fruits and Vegetables, must ever depend upon the food supplied to the plants producing them, and these a very extensive series of trials on various soils has shown, may be secured by the use of Dr. HALLETT'S CONCENTRATED LIQUID FERTILISER, which contains all the essential ingredients of the best foreign Guano, with others equally so, but not to be found by Sea Fowl, in the Atlantic Ocean. Sold at Mr. G. HALLETT'S Factory, Broad Wall, Blackfriars; Messrs. WINSTANLEY'S, Chemists, 7, Poultry; Messrs. WARNER'S, 28, Cornhil; Messrs. HURST and M'MULLEN'S, 6, Leadenhall-street; and every respectable Chemist's and Seedsman's, with directions, in stone quarts, at 1*s.* 6*d.* each, and in bottles, six times the size, at 7*s.* 6*d.* The quart requires 32 gallons of water to reduce it for use, for watering soils and growing bulbs in.

TO LET, A FARM OF 170 ACRES.—PRIORY FARM, Warbleton, Sussex; comprising a large Farm House, fit for a respectable family, with workmen's Cottage, Barns, Stables, and all necessary Agricultural buildings; together with about 170 Acres of Arable, Meadow, Pasture, Hop, and Orchard land; with Gardens; and about 12 Acres of good Marshland, in Pevensey Level. Possession at Michaelmas next. To view the same, apply to JOSEPH PANKHURST, Warbleton; and for terms, to Messrs. PATTENDEN and SMITH, Hop-factors, 247, High-street, Borough.—The right of Sporting over the above, as also some extensive Woodlands adjoining, may be had if required.

Sales by Auction.

TO FLORICULTURISTS. — To be SOLD by AUCTION, by LAREE and SON, by order of Mr. STORY (retiring to the country), at his residence, Isleworth, on MONDAY, June 17, at 12 o'clock, his extensive and superb collection of STOVE and GREENHOUSE PLANTS, consisting chiefly of specimen and hybrid Ericas, Azaleas, Camellias, &c., comprising more than 2000 Plants; a Span-house, Prepared Soils, Flower-Van; and (if not sooner disposed of) the Lease of House, capital Gardens, and Paddock. To be viewed three days prior, when Catalogues may be had on the premises, and at LAREE and SON'S Offices, No. 65, New Bond-street.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE & MORRIS will submit to public competition, at the Auction Mart, Bartholomew-lane, on Tuesday, May 28th, and Thursday, May 30th, 1844, at 12 o'clock each day, a fine collection of DAHLIAS, comprising all the leading varieties; also a splendid assortment of GERANIUMS, the newest varieties of FUCHSIAS, VERBENAS, HEARTSEASE, &c. &c.; a variety of other Flowering Plants. May be viewed the morning of Sale. Catalogues may be had at the Mart, and of the Auctioneers, American Nursery, Leytonstone.

PLANTS FROM NEW ZEALAND.

MESSRS. J. C. AND S. STEVENS beg to announce they will sell by Auction, at their Great Room, 38, King-street, Covent-Garden, on FRIDAY, May 31, at 2 o'clock, a small but interesting Consignment of LIVE PLANTS just arrived, after a short and favourable voyage, direct from Wellington, New Zealand. It is believed that they include several species either quite new or very imperfectly known to European Botanists, including Ferns, Orchideæ, several healthy plants of a new species of Daphne, Taxodium, Aristolochiæ, Clematis, &c. &c. On view Two days prior to the Sale; and Catalogues may be had.

TO BE SOLD—A SPLENDID COLLECTION OF MELOCACTI, EUPHORBIA, AND ALOES. Inquire at No. 22, Park Place, West, Liverpool Road, Islington. Likewise a valuable bed of TULIPS.

TO BE DISPOSED OF, about 200 Fruiting and Succession PINE-PLANTS, principally Queens and Jamaicas, perfectly clean and healthy.—Apply to C. JUDD, Gardener, Bohun Lodge, East Barnet, Herts.

SALE OF LAND.—SWAN RIVER, WESTERN AUSTRALIA.

FOR SALE BY PRIVATE CONTRACT, an Excellent Farm in the district of York, containing 4000 acres of excellent Grazing Land, with two miles and a half Frontage on the Avon River.

The Farmstead comprises a substantially-built Dwelling House, detached Kitchen, spacious Barn and Mill House, with Flour-mill and Wool-press, Stables, Sheds, Stock-yards, &c.

About 65 acres of Land, cleared, inclosed, and in a high state of cultivation, also a Garden and Orchard well stocked with Vines and Fruit-trees.

This Farm adjoins the rising town of York, is close to the high road to Perth, is within ten minutes' walk of a Church, and is in the centre of the best Grazing district in the Colony.

The owner of the above is now on a visit to England for a short time.

For further Particulars apply to Mr. T. O. POWLES, 13, Austin Friars, where a Map of the Estate may be seen.

TO GARDENERS and NURSERYMEN.—To be SOLD, an excellent GARDEN ENGINE, fitted up in a superior manner, with brass valves; can be worked by either one or two persons; it will project water over the largest fruit-trees, to a distance of about 50 feet. As the Engine is of a superior description, and is offered at a very low price, it is worthy the attention of any person requiring one.—Apply to C. H., 20, Thanet-street, Burton-crescent.

MR. RAINY respectfully begs leave to acquaint the Nobility, Gentry, and the Public, that in order to meet the times, and in consequence of the pressure of mortgages and other incumbrances upon estates, and the various descriptions of real property, brought into the market for sale by public auction and private contract, it is his intention to adopt for the future a REDUCED and GRADUATED SCALE of COMMISSION, as compared with that which has been generally customary for the last half century. At the same time that the expenses of vendors will thus be materially diminished, he trusts that he shall be able to afford greater facilities to the attainment of their objects, and to the fullest advantage; and, touching these points, he feels it necessary to offer a few words of explanation.

There exists between many solicitors and many auctioneers an understanding, to which the epithet collusive would scarcely be too severe, because by it the interest of their clients, the vendors, is often seriously compromised, and in this manner:—The vendor, instead of himself selecting the auctioneer or agent for the disposal of his property, will, in many cases, confide the choice to his solicitor; and not unfrequently the solicitor (but upon what justifiable plea Mr. Rainy never could comprehend) arrogates to himself the right of such choice; and repeated instances might be adduced to show that that choice has been exercised in contravention, if not in opposition, to the previously-expressed wishes of the vendors, and wholly regardless of old and long-established connexions; these solicitors having usually a secret compact with the auctioneer, by which he is bound to fee the solicitor with a share of his commission and other charges, as the *sine quâ non* of his being appointed to the sale. And what is the consequence? In such quarters the auctioneer who is willing to concede to the solicitor the largest share, or, in other words, consents to pay the heaviest bribe, he, be he quack or otherwise, and with slight reference to his regular initiation into his profession, or his qualifications or experience, or (what also is evidently an essential consideration) the extent of his connexions and influence, he is preferred. Thus tempted, many solicitors have become reconciled to abuse the patronage they have assumed, and aim at excluding those auctioneers who, like Mr. Rainy, have consistently and uniformly refused to submit to a tyranny subversive of all proper rivalry, and at variance with all independent and honourable feeling.

With respect, however, to what may be considered the legitimate association of the province of the solicitor with that of the auctioneer or public agent, Mr. Rainy, with the desire to obviate jealousies, to produce a more cordial and satisfactory co-operation between those parties, and in the hope of entirely abolishing secret and derogatory compacts, would suggest that, as a remuneration to the solicitor of the vendor, for his advice and assistance in the drawing and settling of the conditions of sale, and for his attention to those legal points which are in immediate relation with that part of the transaction, a fair portion of the commission should accrue to the solicitor (but with the full knowledge and sanction of the vendor), in lieu of the charges now made by him for the particular items adverted to. This, however, is not intended to include charges for investigations of title, abstracts, deeds, or papers, or fees to counsel; and Mr. Rainy entertains no doubt that the nobility, gentry, and the public will approve of and support the principle of repudiating altogether any clandestine dealings between parties employed in affairs so important to them. But, in all cases where the vendors do not consent to the appropriation to the solicitor of such portion of the commission; or the solicitor, from that integrity, impartiality, and strict sense of justice, and that delicacy and liberal feeling which fortunately characterise the conduct of a large number of the members of the legal profession, declines the acceptance of it; then such portion will be remitted by Mr. Rainy to the vendor by whom he is employed.

With regard to sales of pictures, or other works of art, jewels, plate, libraries, and other valuables, a considerable reduction will also be made in the commission, as compared with the printed terms of Messrs. Christie and Manson, Mr. George Robins, and most other auctioneers. On this branch, however, no payment is contemplated to any of that numerous class of individuals who perpetually attempt to interfere, as middle-men, and ask to be rewarded for doing nothing; such voluntary interference being wholly useless and absurd, and indeed very often mischievous to the interests of those whom they pretend to serve. The allowance, therefore, which many auctioneers give, and these persons in secret receive, upon what is termed "the reciprocity system" (meaning, in plain language, on the part of the auctioneer, "procure the sale for me, and I will hand over to you a share of the profit"), will be the amount of the reduction in Mr. Rainy's new scale of commission on chattel and personal property, solely and exclusively in favour of the vendor; and where the total gross proceeds may exceed 5000*l.* a still further abatement will apply to the residue.

A similar rule will also govern Mr. Rainy's charges for putting up property to auction, if not sold; for purchases, valuations (including those for probate), references in cases of compensation, or opinions upon cases; obtaining loans upon mortgage (in conjunction with solicitors), and all other matters incidental to property.

In conclusion, he begs to add that, as heretofore, no sale will be undertaken by him, the genuine character of which will not bear investigation, and every exertion will be made to counteract and defeat combinations and deceptions, whether they are directed against vendors or purchasers.

No. 14, Regent-street, St. James's (in the division between Jermyn and Charles streets.)—April, 1844.

EAST COWES CASTLE, in the ISLE of WIGHT, to be SOLD by PRIVATE CONTRACT, by Mr. RAINY.—This distinguished FREEHOLD MARINE MANSION, of stone, and in the castellated style of the time of Edward the Sixth, was erected, at unlimited expense, by the late John Nash, Esq. It affords the most ample and elegant accommodation for a family of distinction, and is especially suited to any member of the Royal Yacht Club. The scenery is too well known and appreciated to render eulogium necessary, and it will be admitted that the facility of access from the metropolis (the distance being now accomplished in about four hours) gives to the property a much increased value. The chief apartments are lofty, and expensively finished; they include a dining room, 30 feet by 20; a drawing-room, 28 feet 6 in. by 21 feet 6 in.; and a library, 30 feet by 27; a billiard-room, 30 feet 6 in. by 18 feet 6 in.; and an octagon library, 19 feet by 19; numerous principal and secondary bed-chambers and servants' apartments, offices of every description, splendid conservatories, a picture or statue gallery, 70 feet by 21; gardens of a superior order, with hot-houses, &c. The grounds, which are beautifully undulated, contain, with the gardens, paddocks, &c., about 43 acres, embellished with noble timber and plantations of luxuriant growth, and walks of considerable extent are cut through them.—Particulars and tickets to view may be had of Mr. RAINY, 14, Regent-street, St. James's.

NORTH WALES.—To be SOLD, by PRIVATE CONTRACT, by Mr. RAINY, a highly improvable FREEHOLD ESTATE, land-tax redeemed, situate in a fine part of the country, and commencing within a mile of a capital market town. It comprises 2260 acres, with excellent farm-houses and buildings, all well tenanted; a moderate residence and offices (requiring repairs), a fine lake stored with fish, very thriving woods and plantations, &c., forming a fine and very eligible property for investment.—Particulars may be had of Mr. RAINY, 14, Regent-street, St. James's.

RUTLAND GATE, HYDE PARK.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, a very desirable new-built and elegantly finished RESIDENCE, together with the nearly new household furniture. It commands an uninterrupted view over Hyde Park, has an extra story of bed-chambers, a coach-house, and stabling; held for a term of about 90 years, at a small ground-rent.—To be viewed by tickets, and particulars had of Mr. RAINY, 14, Regent Street, St. James's.

CLOSE to SOUTHAMPTON.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, either together or separate, and with immediate Possession, TWO capital detached RESIDENCES, with such portion of park-like land as may be agreed upon, and either with or without a superior Farm, with excellent farm-house and buildings. The whole estate is Freehold, and comprises 175 acres; and from its immediate contiguity to the improving town of Southampton, presents a most favourable opportunity for a successful building speculation.—Particulars may be had of Mr. RAINY, 14, Regent-st., St. James's.

HANTS.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, a capital and spacious FREEHOLD MANSION, standing in a beautiful park of 150 acres, with pleasure-grounds and wilderness, carriage-drives, with lodges, capital walled-garden, hothouses, farm-buildings, &c. &c. The mansion is adapted to the accommodation of a family of distinction, is situated in the midst of the rich and admired scenery of the New Forest, its celebrated field-sports and extensive drives, only nine miles from Southampton, and accessible from the Metropolis in about four hours.—To be viewed with tickets, which, with particulars, may be had of Mr. RAINY, 14, Regent-st., St. James's.

RICHMOND, SURREY, commanding Views of the River Thames and the adjacent Scenery.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, the very beautiful Gothic MANSION, on the rise of the Hill, for many years the residence of the late Mrs. Ellerker, but disposed of on behalf of her representatives, a few months since, to the present owner, who has altered and improved the premises, and made additions at a large outlay. It is arranged to afford complete accommodation for a family of the highest respectability. The dining-room is 30 by 20 and 14 feet high, a library, two drawing-rooms with folding-doors, numerous bed-chambers, offices of every description, ice-house, coach-houses, stabling, and cottage, pleasure-grounds beautifully laid out and ornamented with handsome timber and walks, &c. Or the House would be Let furnished by the year or for six months.—To be viewed by tickets, which may be had of Mr. RAINY, 14, Regent-street, St. James's.

NEAR SOUTHAMPTON. — To be SOLD, by PRIVATE CONTRACT, by Mr. RAINY, with immediate possession, a singularly beautiful MARINE MANSION, upon which the present owner has expended many thousand pounds. It is delightfully situate about four miles and a half from the Southampton, Botley, and Fareham stations, and stands in a park-like paddock of 35 acres, well timbered, with superior gardens and grounds, stabling, lodge, &c., and commands very fine sea and inland views.—Particulars may be had of Mr RAINY, 14, Regent-street, St. James's.

KENT. — Six miles from Canterbury, and near to the Sea.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, a valuable FREEHOLD ESTATE, partly exonerated from land-tax; comprising a park of beautifully undulated surface, a moderate sized family residence, and offices, and also three farms; the whole about 640 acres, and may be treated for together or separately.—Particulars may be had of Mr. RAINY, 14, Regent-street, St. James's.

KENT.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, the very valuable and beautiful Freehold Estate, COMBEBANK, the seat of the late Viscount Templemore, situate in the rich vale between Madam's Court Hill and Sevenoaks, 23 miles from London, and a few miles from a railroad station; comprising the finely-timbered park and woods, sheet of water, the noble mansion, stabling, gardens, pleasure-grounds, and walks, the capital farm, with complete agricultural buildings, lodges, &c. The whole about 520 acres, land-tax redeemed. Many thousand pounds have been expended in improvements upon the mansion and property during the last few years, and the whole is in the most perfect condition. Little Combe Bank, a villa, with grounds and some houses in the village, form part of the estate, and will be included in the purchase. Part of the purchase-money may remain on mortgage.—Particulars and tickets to view may be had of Mr. RAINY, 14, Regent-street, St. James's.

STRETTON-STREET, PICCADILLY, overlooking the Gardens of Devonshire House.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, or Let on Lease, a spacious modern RESIDENCE, with hall and two staircases, capital eating-room, library, and other apartments, on the ground-floor; elegant drawing-rooms and a best bed-chamber and dressing-room, on the one pair; numerous other bed-chambers and servants' apartments, and ample offices on the basement. Coach-house and stabling may be rented at a short distance.—To be viewed by tickets, and particulars had of Mr. RAINY, 14, Regent-street, St. James's.

NEAR RUISLIP, Middlesex, on the borders of Hertfordshire, and about fourteen miles from London.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, with immediate Possession, the delightful RESIDENCE of the late General Sir Joseph Fuller, G.C.B., with offices, stabling, gardens, pleasure grounds, and park-like paddocks; altogether about sixty acres, with ornamental water and fine grown timber. The elegant furniture may be had or not, at the option of the purchaser.—Particulars and tickets to view may be had of Mr. RAINY, 14, Regent-street, St. James's.

BROWNSEA CASTLE and ISLAND, near Poole, Dorsetshire.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, with immediate Possession, the much admired and beautiful FREEHOLD ESTATE, the Island of Brownsea, about a mile and a half in length, and three-quarters of a mile in breadth, at the entrance of the harbour of Poole, a few hours' sail from the Isle of Wight, and within a few miles of the new and much frequented bathing-place, Bournemouth. The castle is spacious and furnished, has excellent gardens, hot-house, conservatory, &c. The island affords wild fowl shooting in the greatest profusion. The situation is peculiarly desirable for yachting, and the scenery is of a picturesque character. The castle would be let furnished, for three years.—Particulars and tickets to view may be had of Mr. RAINY, 14, Regent-street, St. James's.

ACTON, MIDDLESEX, Five Miles from Hyde Park.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, a singularly elegant FREEHOLD RESIDENCE of the best class, approached by a corridor and hall, and containing library opening to a conservatory, drawing-room, dining-room, &c., seven best bed-rooms, ample servants' rooms and offices for a family, coach-houses and stabling, capital kitchen-garden, walled pleasure-ground, and paddock, about 10 acres. The household furniture may be taken at a fair valuation.—To be viewed by tickets, which, with particulars, may be had of Mr. RAINY, 14, Regent-street, St. James's.

BELGRAVE-SQUARE.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY (with immediate possession), the noble and spacious MANSION the residence for some years of the late Lord Hill. It stands detached, with carriage-drive, and has a large garden at the back, with communication to stabling for eight horses, a loose box, standing for several carriages, with lofts and rooms over. Leasehold under the Marquis of Westminster for an unexpired term of 80 years, at a ground-rent.—Particulars and tickets to view may be had of Mr. RAINY, 14, Regent-street, St. James's.

SUFFOLK, on the Borders of Norfolk, and about 80 miles from London.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, a very important and valuable FREEHOLD ESTATE, especially attractive for a sportsman, having been strictly preserved, and affording shooting equal to any domain in the district. It comprehends the entire parish, of nearly 5500 acres, including thriving plantations; also, a capital family mansion, with offices of every description, gardens, pleasure-grounds, &c.; farm-houses and buildings, cottages, &c. The estate is situated in one of the best neighbourhoods in the kingdom, and it is expected that a railroad station will be fixed within a few miles.—Particulars may be had of Mr. RAINY, 14, Regent-street, St. James's.

IN a FASHIONABLE SQUARE at the WEST END.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, a MANSION of the first class, equal in all its arrangements to the accommodation of a family of the highest distinction; the offices and stabling extensive and complete. The adapted furniture will be included in the purchase.—Principals only can, in the first instance, receive information, and which may be had on application to Mr. RAINY, 14, Regent-street, St. James's.

HYDE PARK, commanding the entire Park view.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, or Let Furnished for a term, a very elegant FREEHOLD RESIDENCE, in perfect order, suited to a moderate-sized family. The residence has an extra story of bed-chambers, good offices, and stabling.—To be viewed by tickets, and particulars had of Mr. RAINY, 14, Regent Street, St. James's.

NEAR WELWYN, Herts.—To be DISPOSED OF, the unexpired LEASE of about four years, at a moderate rent, (with a renewal if desired), of the capital and very desirable Residence, DIGSWELL HOUSE, delightfully situate about a mile and a half from Welwyn, in the vicinity of many mansions of persons of rank, and only four miles from Hatfield, seven from Hertford, and twenty-five from London, and in the neighbourhood of Mr. Brand's fox-hounds. The house is adapted to accommodate a large family, the gardens and pleasure-grounds well laid out, and surrounded by about fifty acres of productive land, the whole about seventy acres, ornamented with fine timber, and in excellent order; or the premises would be let furnished.—To be viewed by tickets, which, with particulars, may be had of Mr. RAINY, 14, Regent-street, St. James's.

WATERLOO-PLACE, PALL-MALL, commanding the view to St. James's Park.—The spacious capital MANSION recently occupied by the CLARENCE CLUB.—By Mr. RAINY, on the premises, on THURSDAY, May 30, at One precisely, unless previously disposed of, and with the option of taking the excellent Household Furniture at a fair valuation,

THE capital, spacious, and elegantly-fitted MANSION, No. 12, on the west side of Waterloo-place, held under the Crown for an unexpired term of 70 years, at a small ground-rent. Within the last few years some thousand pounds have been expended in improvements to the premises under the superintendence of an eminent architect, and they are at present in perfect condition, peculiarly adapted for a club, insurance office, or any public establishment requiring a first-rate situation. The ground floor contains a hall, with handsome principal stone staircase and secondary staircase; one room 42 feet 8 inches by 22 feet 9 inches, and another 27 feet by 24 feet. On the one pair, a drawing-room 31 feet 6 inches by 22 feet 6 inches, and a library 42 feet 8 inches by nearly 16 feet, and an ante-library; a billiard room, three other rooms, and four dressing-rooms on the two pair, and six bed-chambers on the upper floor; complete domestic offices on the basement, including spacious kitchen, larders, &c.

To be viewed till the sale by tickets, which may be had of Mr. RAINY, No. 14, Regent street; printed particulars may be had of him 14 days preceding the sale; also of Messrs. LANE and PRIDEAUX, Goldsmiths' Hall; at the Auction Mart; and on the premises.

On the same and following days will be sold by auction the plate, linen, books, china and glass, and the valuable cellar of choice wines, further particulars of which will be given in a few days.

BUCKINGHAMSHIRE.—THE GRANGE, a desirable Freehold Residence, with Pleasure grounds and Gardens, and about 30 Acres of Land, situate at Chalfont, St. Peter's, the Property of the late General O'Loghlin.—By Mr. RAINY, at the Gallery, No. 14, on the East Side of Regent-street, St. James's; about the end of May, with immediate Possession,

THE GRANGE, an elegant Freehold Residence, situate in a beautiful part of the county of Buckingham, midway between London and Aylesbury, about 7 or 8 miles from the West Drayton and Slough stations on the Great Western Railway, and within 9 miles of Windsor and 5 of Uxbridge. It is seated on the acclivity of a hill in a park-like paddock, ornamented with fine old timber and plantations, approached by carriage drives with neat lodges, contains hall and conservatory, drawing-room 32 feet, billiard-room, library, dining-room, 15 bed rooms, three dressing-rooms, excellent offices and stabling, walled kitchen-garden, farm-yard and buildings, ice-house, gardener's house, &c.

To be viewed till the sale, and printed particulars may be had 14 days preceding; also of Messrs. DENDY and MORPHETT, Bream's-buildings, Chancery-lane; at the Royal Hotel, Slough; the Inns at Aylesbury and Uxbridge; at the Auction Mart; and of Mr. RAINY, 14, Regent-street.

BROMPTON-SQUARE.—Neat LEASEHOLD HOUSE, held for 76 years, at a small Ground-rent.—By Mr. RAINY, at the Gallery, No. 14, Regent-street, about the end of May, with immediate possession,

THE neat and substantial LEASEHOLD HOUSE, No. 3, on the west side of Brompton-square, held for 76 years, at a small ground-rent; comprising two rooms on each floor, two kitchens, and other offices, and a garden.

To be viewed, and printed particulars had, 14 days preceding, on the premises; of Messrs. METHOLD and PYKE, No. 43, Lincoln's-inn-fields; at the Auction Mart; and of Mr. RAINY, No. 14, Regent-street.

HAMPSHIRE.—VALUABLE CHURCH PREFERMENT, about 12 Miles from Winchester, and 17 from Southampton; the Incumbent is in his 73d year.—By Mr. RAINY, at the Gallery, No. 14, on the East Side of Regent-street, St. James's, in the Division between Jermyn and Charles-streets, about the end of May,

THE PERPETUAL ADVOWSON of the PARISH of WARNFORD, in the county of Hants, with the appurtenances thereto belonging. The tithes have been commuted at 620*l.* per annum. There is an elegant modern residence, situate on an eminence commanding beautiful scenery, with 20 acres of glebe pleasure grounds, walled garden, stabling, &c. Warnford is about 17 miles from Southampton, 12 from Winchester, and 60 from London, and the neighbourhood is of the highest respectability.

Printed particulars may be had, 14 days preceding the sale, of Messrs. STONE and TURNER, Jermyn-street; at the Auction Mart; at the Dolphin, Southampton, George, Winchester; and of Mr. RAINY, 14, Regent-street.

OPPOSITE the GREEN-PARK.—To be LET, elegantly and completely FURNISHED, for the season, or for one or more years, a superior and spacious MANSION, in perfect condition, having suites of apartments, bed-chambers, and offices, for a family of rank; and at a short distance is excellent stabling.—For particulars and tickets to view apply to Mr. RAINY, 14, Regent-street.

PORTMAN-SQUARE.—To be LET, FURNISHED, for the Season, a compact, moderate-sized HOUSE, with coach-house and stabling.—Particulars and tickets to view may be had of Mr. RAINY, 14, Regent-street, St. James's.

PUTNEY-HILL, SURREY.—LIME-GROVE, a spacious Freehold Mansion, let on Lease for a few years unexpired, and the contiguous beautiful Lands, highly eligible for building upon, and containing altogether about 68 Acres.—By Mr. RAINY, at the Gallery, No. 14, on the East Side of Regent-street, St. James's, in the Division between Jermyn and Charles-streets, about the end of May,

THE spacious and capital detached FREEHOLD MANSION, LIME-GROVE, delightfully situated on the rise of Putney-hill, only four miles and a half from the metropolis. It is approached by carriage drives, and contains suites of noble lofty principal apartments, with numerous bed-chambers, offices of every description, coach-houses, stabling, beautiful lawn ornamented with full-grown timber, pleasure-grounds with extensive walks, walled gardens, &c., the whole about 11 acres, on lease for a few years unexpired at 350*l.* per annum; also the contiguous lands extending from the Putney-hill-road into the road leading from Putney to Wandsworth, and other lands called the Nursery, on the west side of the Putney-hill road, and fronting the road leading from Putney to Richmond; a timber dwelling-house, formerly in the occupation of Mr. Howey, some cottages, &c., altogether about 56 acres and highly eligible for building upon, especially the upper ground, from which the finest views are commanded.

The Mansion can only be viewed by special permission of the tenant, and by cards to be had of Mr. RAINY, 14, Regent-street. Printed particulars with lithographed plans will be ready for delivery 14 days preceding the sale, and may then be had of him; also of Messrs. POWELL, F. and W. BRODERIP, and WILDE, Lincoln's-inn; at the Auction Mart; at the Castle, Richmond; Spread Eagle Wandsworth, and of the person who will attend daily 14 days preceding the sale to show the lands.

ST. JAMES'S SQUARE.—To be sold by PRIVATE CONTRACT, by Mr. RAINY (with immediate possession), the capital FREEHOLD MANSION of a nobleman. The premises are of modern construction, with spacious lofty principal apartments, hall, and two stone staircases, with offices for a suitable establishment and capital stabling. A smaller Freehold House, which fronts Duke-street, and was formerly part of the original estate, may also be purchased if desired.—For particulars and tickets to view apply to Mr. RAINY, 14, Regent-street, St. James's.

HYDE PARK GARDENS, commanding the entire View over Hyde Park.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY (with immediate possession), one of the best MANSIONS in this much admired and highly-improving situation. It was finished and completed by the present owner and furnished throughout without regard to expense; and it may safely be affirmed that it is scarcely possible to find a residence of the scale more perfect, both as regards the decorations and the general style and quality of the furniture. The tenure is leasehold for about 90 years, at a ground-rent.—To be viewed by a day's previous notice, and by tickets, which with particulars may be had of Mr. RAINY, 14, Regent-street, St. James's.

HAMPSHIRE, between Fareham and Gosport, and within a mile and a half of the Railway Station.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, with immediate possession, a very delightful modern FREEHOLD VILLA, with park-like grounds, garden, pleasure-ground, lodges, &c., and the surrounding lands of about 100 acres, part extending to a river, and offering every inducement to any gentleman partial to yachting.—Particulars may be had of Mr. RAINY, 14, Regent-street, St. James's.

HAYES COMMON, two miles from Bromley, in the county of Kent, and twelve from London.—To be LET on LEASE, the very desirable RESIDENCE, for many years the favourite retreat of the late Sir Vicary and Lady Gibbs. It stands on a beautiful lawn, with pleasure-grounds, gardens, and paddocks (about 15 acres), and contains accommodation for a family of high respectability, with stabling, entrance lodge, &c.—For particulars and tickets to view apply to Mr. RAINY, 14, Regent-street, St. James's.

MIDDLESEX, ten miles from Town.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, a capital FARM, part freehold and part copyhold, containing about 217 acres of rich land, with an excellent house and buildings, on lease to a most respectable tenant, till Michaelmas, 1847.—Particulars may be had of Mr. RAINY, 14, Regent-st., St. James's.

BUCKINGHAMSHIRE.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, with immediate Possession, a FREEHOLD ESTATE of about 90 acres of Grass and Arable Land, with agricultural buildings, and an unfinished House, situate at Farnham Royal, two miles and a half from the Slough Station of the Great Western Railway.—Particulars may be had of Mr. RAINY, 14, Regent-st, St. James's.

BATTERSEA, Surrey.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, with immediate possession, a capital spacious FREEHOLD RESIDENCE, on the banks of the Thames, with terrace-walk, pleasure-grounds, kitchen-garden, paddock, coach-houses, stabling, &c. Also, some other Freehold Property for investment.—Particulars may be had of Mr. RAINY, 14, Regent st., St. James's.

TOTTERIDGE, MIDDLESEX, Ten Miles from London.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, a very desirable and substantial detached LEASEHOLD FAMILY RESIDENCE, held for an unexpired term of upwards of thirty years, at a very low rent, with offices, coach-houses, and stabling, pleasure-grounds and walks, kitchen and flower-gardens, with fish-pond and park-like meadows, altogether about thirty acres, with three detached cottages, gardener's cottage, and other buildings. The premises are in perfect order, a very considerable sum having been expended upon them, and they are in every respect suited to a family. Or the house and gardens would be let on lease.—For particulars and tickets to view, apply to Mr. RAINY, 14, Regent-street, St. James's.

DURHAM, within one day's ride of London by the Railroads.—To be LET, for three or five years, a spacious FAMILY RESIDENCE, FURNISHED in a superior style, and adapted for a person of fortune, situate in a beautiful part of the country, with good fishing and hunting, and the exclusive right of shooting over about two thousand four hundred acres. The neighbourhood of the best class, and the circumstances altogether peculiarly desirable. Land may be had or not, at the option of the tenant.—Particulars to be had of Mr. RAINY, 14, Regent-street, St. James's.

ENFIELD, MIDDLESEX.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, CHASE LODGE, a substantial and handsome Freehold Villa, with pleasure-grounds, gardens, and paddocks (the latter part leasehold), about 27 acres.—Particulars may be had of Mr. RAINY, 14, Regent-street, St. James's.

NEAR CHRISTCHURCH, HANTS.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, a MARINE VILLA, situate midway between Lymington and Christchurch, commanding splendid sea views; and also an adjoining farm of about 108 acres, with farm-house and buildings, the whole freehold.—To be viewed by tickets, and particulars had of Mr. RAINY, 14, Regent Street, St. James's.

GROSVENOR-PLACE, HYDE PARK, in front of the Gardens of Buckingham Palace.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, a noble and very spacious MANSION, held for a long term, at a low ground-rent, and adapted in all respects to a family of distinction, with attached and detached offices, standing for four or five carriages, and stabling for eight horses. The Mansion has an extra story of bed-chambers, a suite of superb drawing rooms—viz. 27 feet by 20, 22 feet by 19, 25 feet by 19, and 37 feet by 25, all communicating by folding doors; an eating-room, 37 feet by 25, a library, ante-room, two stone staircases, stone hall, screened by a porch, &c.; the whole of the household furniture and fixtures will be included in the purchase, and immediate possession may be had.—To be viewed by tickets, which, with particulars, may be had of Mr. RAINY, 14, Regent-street, St. James's.

COTTAM AND HALLEN, AGRICULTURAL IMPLEMENT Makers, &c. 2, Winsley-street, Oxford-street, London.

DOUBLE-MOTION HAYMAKERS of the best construction, made almost wholly of iron, and containing the double Cylinder, and all the latest improvements, are now ready.

CAST-IRON RICK-STANDS and PIGTROUGHS, at very low prices.

IRON HURDLES AND FIELD-GATES of all sizes, at exceedingly low prices.

PLOUGHS, DRILLS, Sheep and Cattle Weighing Machines, Improved Prize Harrows, Field Rollers, Turnip-cutters, Chaff-cutting Machines, Threshing and Winnowing Machines, Oil-cake Breakers, and every description of Implements used in Agriculture.

Show Rooms at their Manufactory, 2, Winsley-street, Oxford-street, where every information may be obtained.

WIRE-WORK, HOT-WATER APPARATUS, GREENHOUSES, &c.

ST. THOMAS BAKER, MANOR-HOUSE, MANOR-PLACE, KING'S-ROAD, CHELSEA, Manufacturer of INVISIBLE WIRE FENCE, to resist Grazing Stock, and rendered Rabbit-proof. WIRE-WORK in Trainers, Arches for Walks, Bordering, Flower-stands, Pheasantries, &c. HORTICULTURAL BUILDINGS, Green and Hothouses, Conservatories, &c. The same heated by HOT-WATER APPARATUS, on improved and economical principles.

Parties waited on in Town or Country, and Drawings and Estimates free. Work for the Trade as usual.

Ward's Cases, or Domestic Greenhouses.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery. they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

AT THE CORN MARKET, MARK-LANE,
On Monday, 27th inst., at 2 o'clock.

GUANO, a Cargo just arrived from the West Coast of Africa. Particulars and Catalogues to be had of WM. KIRKMANN & Co., 2, St. Dunstan's Hill, Tower-street. 24th May, 1844.

GUANO (GENUINE PERUVIAN & BOLIVIAN ON SALE, BY THE ONLY LEGAL IMPORTERS,
ANTONY GIBBS AND SONS, LONDON;
WM. J. MYERS AND CO., LIVERPOOL;
And by their Agents,
COTESWORTH, POWELL, AND PRYOR, LONDON;
GIBBS, BRIGHT, & CO., LIVERPOOL and BRISTOL.
47, Lime-street, May 16, 1844.

TURNIP SEASON.

GUANO (Foreign and Potter's), RAPE-DUST, BONE-DUST, CLARKE'S COMPOST, and all other MANURES for the TURNIP CROP, to be had on the best terms, of MARK FOTHERGILL, 40, Upper Thames-street.

TO GARDENERS AND AGRICULTURISTS.

SUPER-PHOSPHATE of LIME is capable of producing a more rapid vegetation in Plants than any substance known. It may be had at Mr. LAWES' Factory, Deptford Creek, price 7*s.* per cwt.

Phosphate of Potash, 15*s.* per cwt.
" Soda 12*s.* "
" Magnesia 9*s.* "
" Ammonia 1*s.* per lb.

*** Super-phosphate of Lime in a concentrated form may also be procured of Messrs. WARNER, 28, Cornhill, and other Seedsmen, in 7 lb. packets, price 1*s.*

TURNIP SOWING.—BRAIN'S ENGLISH GUANO MANURE.—This powerful Manure having been subjected to the most rigorous Analysis by some of the first Agricultural Chemists of the day, it is pronounced by them to be much stronger, and to possess more highly fertilising properties, than the very best samples of foreign brought to this country. Price 9*l.* per ton; no charge for sacks, and delivered free of charge to any wharf, railway, or waggon-office in town.—Address, FREDERICK BRAIN, Guano Works, Thomas-street, Stamford-street, Blackfriars-road, London.

N.B.—Directions for use sent with all orders.

LIQUID MANURE.

ENGLAND INDEPENDENT OF THE WORLD FOR CORN.

THE attention of the Agricultural Interest, at this momentous crisis, is requested to the great importance of LIQUID MANURE, and the ease with which it may be appropriated, by the use of FOWLER'S PUMPS, made expressly for the purpose, either portable or fixed; Garden, Ship, and Barge Pumps, also, those for Distillers, Brewers, Soap-boilers, and Tanners, for hot and cold liquor. Pumps kept for Hire, for Excavations and Wells. Buildings heated by Hot-water, for Horticulture, and every variety of manufacturing purposes. The Trade supplied on advantageous terms, by BENJAMIN FOWLER, Engineer, &c., 63, Dorset-street, Fleet-street, London.

FOR TURNIPS.

THE Urate of the London Manure Company, 4 guineas per ton. The London Manure Company have great pleasure in acquainting their friends that they have this day reduced the Urate from 5*l.* to 4 guineas per ton, at the same time pledging themselves that the quality shall be fully maintained. The Urate will be found most valuable for Turnips, by promoting a rapid growth; it secures a full plant, at the same time producing a great weight per acre, and extending its beneficial effects to the succeeding crops. It may be sown broadcast, or, which is preferable, by the drill, at the rate of one ton to 3 acres; and it is desirable it should not be placed more than 2 inches below the surface. Gardeners and Florists will find it very useful for Dahlias, and other roots. Full particulars and testimonials will be forwarded on application. Genuine Peruvian Guano; Phosphate and Sulphate Ammonia; Gypsum, and every other artificial manure.—EDWARD PURSER, Secretary, 40, New-bridge-street.

KEENE'S PATENT MARBLE CEMENT.—This CEMENT is particularly adapted for the Walls and Floors of Conservatories and Greenhouses, being calculated, from its extreme hardness, to resist the wear incident to ordinary Plastering. For Floors it has a threefold advantage over Stone-paving. 1st, in its lightness; one inch in thickness of KEENE'S CEMENT sufficing where 2 to 3-inch flagging would be employed. Next, in its appearance, combining, as it does, the hardness of stone with a uniform colour and even surface free from joints; and lastly, in economy, being one-third the price of Portland paving.

The most conclusive evidence can be given of the utility of KEENE'S CEMENT for these purposes by the Patentees and Manufacturers.—JOHN BAZLEY WHITE and Sons, Millbank-street, Westminster.

GLASS SUPERSEDED FOR HORTICULTURAL PURPOSES BY

WHITNEY'S CHEMICAL, TRANSPARENT, WATERPROOF COMPOSITION, for rendering Muslin, Calico, or Linen, for the Frames of Greenhouses, Pine, Melon, or Cucumber Stoves, &c., impervious to Rain or Moisture, admitting light equal to Glass, the *burning* rays of the *sun alone* being obstructed. Houses or pits covered with Calico, &c., prepared with this Composition, embrace important advantages over Glass. The light being equally diffused in every part of the house, plants placed on the floor have as much light as those close to the covering, consequently they are not drawn up as under Glass, while they continue much longer in *bloom*, and preserve their *delicate tints unfaded* till the *blossom falls*.

Whitney's Substitute for Glass.—I have had screens of calico rendered transparent with Mr. Whitney's invaluable varnish, and used them last winter, with a success far exceeding my most sanguine expectations, though my anticipations had been considerably excited. Indeed I consider Mr. Whitney's discovery as an invaluable boon to the horticulturist, one that will bear competition with any invention connected with the art and mystery of Horticulture in modern times. My screens were about 9 feet long each, and were inclined to the wall separated about 12 inches below, and as my object was to ascertain the value of the screens, in reference to *radiation*, they were *left open at each end*. Suffice it to say, the Fuchsia, Pomegranate, Passion-flower, Japan Honeysuckle, and others still more delicate and susceptible, were effectually preserved, and that without the slightest check to their growth, or any injury whatever. I am of opinion that in this *new aspect*, it possesses a protecting influence *infinitely superior to glass*, because the effects of radiation, a most powerful source of cold, are *not intercepted by glass*, which so materially counteracts the artificial temperature within; I cannot, therefore, but conclude, that for the protection, not merely of the early blossom, but the maturation of the fruits as in the case of the Peach, Nectarine, Apricot, and Grape, these transparent screens, thus prepared, are invaluable, and their triumphant success certain. Add to this, for Cucumber and Melon frames, their superiority over glass is undoubted for preventing flagging of the foliage (sometimes being scorched) by day, and the chilling effects of radiation by night. Screens prepared with Whitney's Transparent Varnish should be also used as shades in the intensity of a summer's sun, and for protection against radiation in winter, for the stove, greenhouse and conservatory. Even in the *economy of fuel* the value of such screens is demonstrable, as less will be required to maintain an equable warmth, its escape by radiation being thus effectually checked.—J. M., 16*th April*, 1844.

Prepared by GEORGE WHITNEY, Chemist, Shrewsbury; and sold in Bottles, 2*s.* 6*d.* and 4*s.* 6*d.*, with ample directions for use; and, as a protection to the public, the signature of the inventor is on each bottle. Sold by the principal Seedsmen in London and throughout the kingdom. Merchants, Seedsmen, and Florists supplied by Mr. Bailey, North-street, Wolverhampton.

THIS DAY IS PUBLISHED, PRICE SIXPENCE, STAMPED TO GO FREE BY POST,

The SIXTH NUMBER of

The Railway Chronicle.

JOURNAL OF ENGINEERING IMPROVEMENTS, MECHANICAL INVENTIONS, PUBLIC WORKS, &c.

THERE HAS BEEN CREATED within the last ten years a PRODUCTIVE PROPERTY IN RAILWAYS amounting to more than SIXTY MILLIONS sterling, with a REVENUE of nearly SIX MILLIONS PER ANNUM. This addition to the wealth and resources of England has been produced by the Investment of the funds of nearly Fifty Thousand Individuals, who form the Railway Constituency of Great Britain. It affords employment to a great body of our Workmen, tends to the development of our industrial Capabilities, and is a boon to the whole travelling Population.

It is strongly felt that Railway property, involving interests so extensive, should not be exposed to the injurious effects which the want of sound information and the circulation of erroneous statements for party purposes so constantly produce; and it has appeared, to those most capable of judging, that the mutual interests of the Proprietary, the Managers, and the Railway Executive, and the Public interests with which they are identified, have as yet found *no* organ in which they can be fairly discussed and satisfactorily adjusted. The Railway Chronicle has been projected to supply this deficiency, by THE ESTABLISHMENT OF AN AUTHENTIC AND IMPARTIAL MEDIUM OF COMMUNICATION BETWEEN ALL THE MEMBERS OF THE GREAT RAILWAY COMMUNITY; having especially in view the free communication of useful information, the promotion of the common interests and the general circulation of sound intelligence in all that relates to Railway property.

The Conductors of the Railway Chronicle will use their anxious endeavours to advance the great interests of Railway property, avoiding all indulgence of personal feeling, the expression of party prejudice, or the advancement of exclusive interests:—they desire, in short, to furnish an unbiassed Chronicle of facts, and a fair arena for the discussion of important opinions and principles.

The Railway Chronicle *contains the earliest and most authentic information on the following subjects:—*

THE CONDITION AND PROSPECTS OF RAILWAYS NOW IN USE.
POSITION, PROGRESS, AND VALUE OF FOREIGN RAILWAYS.
PROGRESS OF RAILWAYS IN EXECUTION.
PROJECTED NEW RAILWAYS.
THE TRAFFIC AND REVENUE OF RAILWAYS.
THE ECONOMY OF WORKING AND EXPENDITURE.
THE VALUE OF SHARES.
PAYMENT OF CALLS, DIVIDENDS, AND DEBENTURES.
THE PROCEEDINGS AT RAILWAY MEETINGS, WITH THE DOCUMENTS LAID BEFORE SUCH MEETINGS.
WEEKLY REPORTS ON THE MONEY AND SHARE MARKETS.
THE PROCEEDINGS OF THE BOARD OF TRADE AND OTHER PUBLIC OR MUNICIPAL BODIES, SO FAR AS THEY AFFECT THE INTERESTS OF RAILWAY PROPERTY.
PARLIAMENTARY RAILWAY PROCEEDINGS.

ENGINEERING WORKS OF MERIT ON RAILWAYS AT HOME AND ABROAD.
ENGINEERING IMPROVEMENTS ON RAILWAYS AT HOME AND ABROAD.
MECHANICAL INVENTIONS RELATING TO RAILWAYS AT HOME AND ABROAD, ILLUSTRATED BY WOOD-CUTS.
LOCOMOTIVE IMPROVEMENTS AND INVENTIONS AT HOME AND ABROAD.
REPORTS OF THE SCIENTIFIC SOCIETIES, WHENEVER ANY SUBJECTS AFFECTING RAILWAYS ARE DISCUSSED.
RAILWAY LITERATURE.
RAILWAY PATENTS.

Arrangements have been made for the purpose of supplying in the Railway Chronicle the earliest information concerning the FRENCH RAILWAYS (*the figures being in English money*), in which so much British capital is now invested, and the other Railways on the Continent which are in progress or in prospect.

Weekly Reports from the London, Liverpool, Manchester, and Northern Share Markets will afford the Capitalist the means of judging of the condition of Railway investments.

Another peculiar feature of the Railway Chronicle is to consist in a series of papers on each of the Great British Railways—in which the Past History, Present Condition, and Future Prospects of every Railway will be concisely developed. It is hardly to be presumed, that the great number of persons who have of late years begun to interest themselves in Railway Property, can have had the leisure and opportunity necessary to understand the peculiar circumstances and character of each individual Railway, so as to estimate properly the relative value and prospective profit of these investments. This information will be given in the successive Numbers of the Railway Chronicle. For those who are now for the first time becoming subscribers to a Railway Paper, this feature is important, as it will enable them rapidly to obtain an acquaintance with the whole of the existing lines.

To CAPITALISTS, BANKERS, SOLICITORS, STOCK-BROKERS, INSURANCE COMPANIES, and all who hold Money for investment, the Railway Chronicle will furnish such sound unprejudiced information as shall enable them at once to make a judicious choice for the investment of funds at their disposal.

To ENGINEERS, the Railway Chronicle will afford information on all points of Practical Engineering that may tend to the advancement of the profession, and to the perfection of that Railway communication which their talents have placed in its present admirable condition, and which it remains for their skill to render more available to the Public, and therefore more beneficial to the Shareholder. Through this channel of intercommunication every intelligent person will have an opportunity of contributing to the common stock of knowledge, and consequently to the general welfare.

To CONTRACTORS, MANUFACTURERS, INVENTORS, and PRACTICAL ENGINEERS and MECHANICS, the Railway Chronicle will afford the means of bringing before the Influential Part of the Railway Proprietary, such Inventions, Discoveries, Practical Works, Mechanical Improvements and Articles of Manufacture, as they may desire to introduce into Railway employment; and it will afford the means of ascertaining where their practical assistance can be required either on lines projected or in execution. Thus the columns of the Railway Chronicle will open a market for the labour of the Contractor, the inventions of the Mechanist, and the commodities of the Manufacturing Engineer.

The Railway Chronicle

Is published EVERY SATURDAY, in time for the Morning Mails.

☞ Orders received by all Newsmen.

Office for Advertisements and Communications, 14, *Wellington-street North, Strand, London.*

PRINTED FOR

TAYLOR AND WALTON,

BOOKSELLERS AND PUBLISHERS TO UNIVERSITY COLLEGE,

UPPER GOWER-STREET.

DARLEY'S SCIENTIFIC LIBRARY,

FOR THE USE OF

SCHOOLS, PRIVATE STUDENTS, ARTISTS, AND MECHANICS.

IT is the purpose of this Work to furnish a Series of Elementary Treatises on Mathematical Science, adapted to the wants of the public at large. To youth of either sex at public and private schools; to persons whose education has been neglected, or whose attention has not been directed in early life to such studies; and to Artists and Mechanics these little works will be particularly suited. The principles of the various Sciences are rendered as familiar and brought as near to our commonest ideas as possible: the demonstrations of propositions are made plain for the mind and brief for the memory; and the Elements of each Science are reduced not only to their simplest but to their shortest form.

I.

A NEW EDITION (being the fifth) *is now in the Press,*

A SYSTEM OF POPULAR GEOMETRY;

Containing in a few Lessons so much of the Elements of Euclid as is necessary and sufficient for a right understanding of every Art and Science in its leading truths and great principles.

BY GEORGE DARLEY, A.B.

Price 4*s.* 6*d.*, cloth.

II.

NEW EDITION (just published),

COMPANION TO THE POPULAR GEOMETRY;

In which the Elements of Abstract Science are familiarised, Illustrated, and rendered practically useful to the various purposes of life, with numerous Cuts.

BY GEORGE DARLEY, A.B.

Price 4*s.* 6*d.*, cloth.

III.

THIRD EDITION,

A SYSTEM OF POPULAR ALGEBRA;

WITH

A Section on PROPORTIONS and PROGRESSIONS.

BY GEORGE DARLEY, A.B.

Price 4*s.* 6*d.*

"For Students who only seek this limited knowledge of these sciences, there are, perhaps, no treatises which can be read with more advantage than Darley's Popular Geometry and Algebra."—*Library of Useful Knowledge, article "Mechanics."*

IV.

SECOND EDITION,

A SYSTEM OF POPULAR TRIGONOMETRY,

Both Plane and Spherical.

With POPULAR TREATISES on LOGARITHMS, and the Application of Algebra to Geometry.

BY GEORGE DARLEY, A.B.

Price 3*s.* 6*d.*, cloth.

V.

FAMILIAR ASTRONOMY.

BY GEORGE DARLEY, A.B.

WITH ENGRAVINGS.—12mo, 5*s.*, cloth lettered.

"There is a vast deal of astronomical information conveyed in a most winning and unassuming manner in this delightful little volume, which, not less for the novelty of its plan than the extent of its intelligence, reflects infinite credit on the taste and talents of its projector and editor, Mr. Darley."—*Sun.*

Complete in 6 Vols. 8vo, containing 509 Plates, Price, Coloured, 9*l.*—Plain, 5*l.* 15*s.*

FIGURES and DESCRIPTIONS of the GENERA of BRITISH FLOWERING PLANTS, with the Scientific and English Names—Linnæan Class and Order—Natural Order—Generic and Specific Characters—References to the most Popular Botanical Works—Localities—Time of Flowering—Description of the Plants—and Dissections showing the Essential Characters. By W. BAXTER, F.H.S., &c.

Oxford: Published and sold by the Editor, at the Botanic Garden; sold also by J. H. PARKER; and by WHITTAKER & Co., London.

Just published, 3d edit., corrected and improved; fcap. 8vo, 6*s.*

RIVERS' ROSE AMATEUR'S GUIDE: containing ample Descriptions of all the fine leading Varieties of Roses, with the Modes of Cultivating them.

London: LONGMAN, BROWN, GREEN, and LONGMANS.

Second edition, in small 8vo, price 3*s.* 6*d.*

PRODUCTIVE FARMING; or a FAMILIAR DIGEST of the Recent Discoveries of LIEBIG, DAVY, and other celebrated Writers on Vegetable Chemistry; showing how the results of English Tillage might be greatly augmented. By JOSEPH A. SMITH.

W. TAIT, Edinburgh; SIMPKIN, MARSHALL, & Co., London.

Just published, cloth, price 7*s.* 6*d.* boards,

A MANUAL of BRITISH BOTANY, in which the Orders and Genera are arranged and described according to the Natural System of De Candolle; with a Series of Analytical Tables for the Assistance of the Student in the Examination of the Plants indigenous to, or commonly cultivated in, Great Britain. By D. C. MACREIGHT, M.D., Fellow of the Royal College of Physicians.

London: JOHN CHURCHILL, Princes-street, Soho.

This day is published, 8vo, price 5*s.* 6*d.*,

ON SOME of the MOST IMPORTANT DISORDERS of WOMEN. By GEORGE ROBERT ROWE, M.D., F.S.A., Member of the Royal College of Physicians, London, &c.

London: JOHN CHURCHILL, Princes-street, Soho.

Just published, 8vo, cloth, 6*s.*,

ON the NATURE and TREATMENT of TIC DOULOUREUX, SCIATICA, and other NEURALGIC DISORDERS. By HENRY HUNT, M.D., Member of the Royal College of Physicians, London; Physician to the Royal Metropolitan Hospital for Children, &c.

London: JOHN CHURCHILL, Princes-street, Soho.

Just published, second edition, 12mo, cloth, 5*s.*,

A COMPENDIUM of DOMESTIC MEDICINE; comprising Plain Directions for the Employment of Medicines, with their Properties and Doses, brief Description of the Symptoms and Treatment of Diseases, and of the Disorders incidental to Children; with a selection of the most efficacious Prescriptions. Intended as a source of easy reference for Clergymen, and for families residing at a distance from professional assistance. By JOHN SAVORY, Member of the Society of Apothecaries.

London: JOHN CHURCHILL, Princes-street, Soho.

Now ready, price 4*s.* 6*d.*,

RURAL CHEMISTRY.

By EDWARD SOLLY, Esq., F.R.S.,

Experimental Chemist to the Horticultural Society of London, Hon. Mem. of the Royal Agricultural Society, and Lecturer on Chemistry, at the Royal Institution.

&c. &c. &c.

Extracts from the Introduction:—

"A knowledge of the chemical composition of soils and the various substances employed as manures enables us to comprehend the mode in which the latter act; and a knowledge of the nature of those substances which plants require, points out the best and most economical methods of restoring to the soil, by manures, those substances which plants remove from it."

"If the farmer knows what it is that gives the fertilizing powers to manure, and is aware of the nature of those substances, he will soon learn the best method of preserving and using them: he will then understand how to make the most of the various sources of manure at his disposal, and he will be enabled readily to save much, that, for the want of such knowledge, would otherwise be lost."

WORKS

On AGRICULTURE, LAND-SURVEYING, NATURAL HISTORY, & SCIENCE.

PRINTED FOR

LONGMAN, BROWN, GREEN, & LONGMANS.

AN ENCYCLOPÆDIA of AGRICULTURE; comprising its History in all Countries, the Principles on which Agricultural Operations depend, and their Application to Great Britain and similar Climates. By J. C. LOUDON, F.L.S. Fifth Edition, 8vo, nearly 1,300 Woodcuts, 2*l.* 10*s.* The Supplement bringing down Improvements in the Art of Field Culture from 183. to 1843 inclusive, comprising all the previous Supplements, and illustrated with Sixty-five Engravings on Wood, may be had separately, price 5*s.*

THE FARMER'S ENCYCLOPÆDIA, and DICTIONARY of RURAL AFFAIRS; embracing all the recent Discoveries in Agricultural Chemistry; adapted to the comprehension of unscientific readers. By CUTHBERT W. JOHNSON, Esq., F.R.S. 8vo, Woodcuts of the best and most improved Agricultural Implements, 2*l.* 10*s.*

"Cuthbert Johnson's 'Farmer's Encyclopædia' is one of the best books of its class."—*Gardeners' Chronicle.*

ELEMENTS of PRACTICAL AGRICULTURE. By DAVID LOW, Esq., F.R.S.E., Prof. of Agriculture in the University of Edinburgh. Fourth Edition, greatly improved. 8vo, 200 woodcuts, 21*s.*

'Low's Elements of Practical Agriculture,' is the best work on Farming in our language."—*Gardeners' Chronicle.*

The BREEDS of the BRITISH DOMESTICATED ANIMALS DELINEATED and DESCRIBED. By DAVID LOW, Esq., F.R.S.E., Prof. of Agriculture in the University of Edinburgh. 2 vols. 4to, with 56 coloured plates, 16*l.* 16*s.*

AN INQUIRY into the NATURE of the SIMPLE BODIES OF CHEMISTRY. By DAVID LOW, Esq., F.R.S.E., Professor of Agriculture in the University of Edinburgh. 8vo, 6*s.*

THE APPLICATION of GEOLOGY to AGRICULTURE, and to the Improvement and Valuation of Land: with the Nature and Properties of Soils, and the Principles of Cultivation. By N. WHITLEY, Land Surveyor. 8vo, 7*s.* 6*d.*

THE ART of VALUING RENTS and TILLAGES, And the Tenant's Right of Entering and Quitting Farms, explained by several Specimens of Valuations; and Remarks on the Cultivation pursued on Soils in different Situations. Adapted to the Use of Landlords, Land-Agents, Appraisers, Farmers, and Tenants. By J. S. BAYLDON. 6th Edition, corrected and revised, by JOHN DONALDSON, Land-steward, Author of "A Treatise on Manures and Grasses." 8vo. 10*s.* 6*d.*

SIR HUMPHRY DAVY'S AGRICULTURAL CHEMISTRY. With Notes by DR. JOHN DAVY. 6th Edition, 8vo, 10 Plates, 15*s.*

CROCKER'S ELEMENTS of LAND-SURVEYING. Fifth Edition, corrected throughout, and considerably improved and modernised, by T. G. BUNT, Land Surveyor, Bristol. To which are added, TABLES OF SIX-FIGURE LOGARITHMS, &c., superintended by RICHARD FARLEY, of the Nautical Almanac Establishment. Post 8vo, 12*s.*

A COMPLETE TREATISE on PRACTICAL LAND SURVEYING. By A. NESBIT. 7th Edition, enlarged. 8vo, Woodcuts, Copper plates, and Field-Book, 12*s.*

A TREATISE on PRACTICAL MENSURATION: containing the most approved Methods of Drawing Geometrical Figures; Mensuration of Superficies; Land Surveying; Mensuration of Solids; the use of the Carpenter's Rule; Timber Measure, &c. &c. By A. NESBIT. 12th Edition, 12mo, Wood-cuts, Copper-plates, and Field-Book. 6*s.* KEY, 5*s.*

ILLUSTRATIONS of the PRINCIPLES and PRACTICE of WARMING and VENTILATING; with Preliminary Remarks on Health and Length of Life. By D. B. REID, M.D., F.R.S.E. 8vo. With Diagrams and 320 Engravings on Wood. 16*s.*

RESEARCHES on LIGHT; an Examination of all the known Phenomena connected with the Chemical influence of the Solar Rays; embracing all the published Photographic Processes and many new Discoveries in the Art, &c. By R. HUNT, Secretary to the Royal Cornwall Polytechnic Society. 8vo, with Plate and Woodcuts, 10*s.* 6*d.*

A MANUAL of ELECTRICITY, MAGNETISM, and METEOROLOGY. By DIONYSIUS LARDNER, D.C.L., F.R.S. and C. V. WALKER, Esq., Secretary of the Electrical Society. 2 vols. fcap. 8vo. Vignette-titles, 12*s.*

LESSONS on CHEMISTRY; for the Use of Pupils in Schools, Junior Students in Universities, and Readers who wish to learn the fundamental principles and leading facts. By WILLIAM H. BALMAIN. Fcap. 8vo, numerous Woodcuts, illustrative of the Decompositions. 6*s.*

A TREATISE on FOOD and DIET: with Observations on the Dietetical Regimen suited for Disordered States of the Digestive Organs. By JON. PEREIRA, M.D., F.R.S., & L.S. 8vo, 10*s.*

DR. TURTON'S MANUAL of the LAND and FRESH-WATER SHELLS of the BRITISH ISLANDS. A New Edition, thoroughly revised, and with considerable Additions. By JOHN EDWARD GRAY, Keeper of the Zoological Collection in the British Museum. Post 8vo, Woodcuts and coloured Plates, 15*s.*

POPULAR CONCHOLOGY; or, the Shell Cabinet arranged: being an Introduction to the Modern System of Conchology; with a sketch of the Natural History of the Animals, an Account of the Formation of the Shells, and a complete Descriptive List of the Families and Genera. By AGNES CATLOW. Fcap. 8vo, 312 Woodcuts, 10*s.* 6*d.*

ELEMENTS of NATURAL HISTORY, for the Use of Schools and Young Persons; comprising the Principles of Classification, interspersed with amusing and instructive original accounts of the most remarkable Animals. By Mrs. LEE (formerly Mrs. T. E. BOWDICH), Author of "Taxidermy," "Memoirs of Cuvier," &c. 12mo. 55 Woodcuts. 7*s.* 6*d.*, bound.

TAXIDERMY; or, the Art of Collecting, Preparing, and Mounting Objects of Natural History: for the Use of Museums and Travellers. By Mrs. R. LEE (formerly Mrs. T. E. BOWDICH), Author of "Memoirs of Cuvier," &c. Sixth Edition, improved, with an Account of a Visit to Walton Hall, and Mr. Waterton's method of Preserving Animals. Fcap. 8vo. Wood Engravings, 7*s.*

LONDON: LONGMAN, BROWN, GREEN, & LONGMANS.

Printed by WILLIAM BRADBURY, of Stoke Newington, and FREDERICK MULLET EVANS, of No. 7, Church-row, Stoke Newington, both in the county of Middlesex, printers, at their office in Lombard-street, in the precinct of Whitefriars, in the City of London; and published by them at the office, No. 5, Charles-street, in the parish of St. Paul's, Covent-Garden, in the said county, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, May 25, 1844.

The Newspaper.

SATURDAY, MAY 25, 1844.

NATIONAL MERCANTILE LIFE ASSURANCE SOCIETY, ARTHUR-STREET WEST, LONDON BRIDGE. (Established in 1837.)

Directors.

Chairman.—Robert Currey, Esq.

Edward Baker, Esq.	Thomas Bax, Esq.
Jasper Capper, Esq.	Joseph Cooper, Esq.
Thomas Dakeyne, Esq.	Russell Jeffrey, Esq.
Giles Redmayne, Esq.	William R. Spicer, Esq.
James Spicer, Esq.	Joseph Sterry, jun., Esq.
Henry Sterry, Esq.	Robert Wilcoxon, Esq.

Bankers.—Messrs. Prescott, Grote, and Co.

ADVANTAGES.

A BONUS of two-thirds of the Profits allotted to the Assured.

LOWER RATES OF PREMIUM charged for Assurances without profits.

PREMIUMS payable Annually, Half-yearly, or Quarterly.

ASSURANCES OF EVERY DESCRIPTION may be effected. Among others, the important one, *originated by this Society*, of securing a sum to the Assured himself on his attaining any given age, or to his family *in the event of his earlier death*.

A POCKET DIARY, containing detailed particulars, may be had on application at the Office, or of the Society's agents.

JENKIN JONES, Actuary and Secretary.

NEW PROSPECTUS.

ALBION LIFE INSURANCE COMPANY, Instituted in 1805, New Bridge-street, Blackfriars. Bonus every Three Years. Eighty per cent., or four-fifths of the profits returned on policies effected on and after this day.

The New Prospectus, containing a full detail of the highly advantageous terms on which Life Insurances are now granted by this Company, may be obtained at the Company's Office.

1st May, 1844. EDWIN CHARLTON, Sec.

VICTORIA LIFE ASSURANCE COMPANY.—

Trustees.

Sir Jas. Duke, Ald., M P., Chairman.
Benjamin Hawes, Esq., Deputy Chairman.
Benjamin Barnard, Esq. | Charles Baldwin, Esq.

Peculiar advantages are offered by this Company. Thus—

Parties assuring the lives of others may make their policies secure, notwithstanding the life assured may go out of the limits of Europe, without the necessary permission of the Directors having been previously obtained.

Credit of half the premiums for the first five years allowed on policies effected for the whole term of life.

On policies of five years' standing, half the amount paid, after the first year's premium, may be borrowed thereon by the Assured.

Advances made to assurers on real or undoubted personal security, for terms of years, re-payable by instalments.

Attention is particularly requested to the detailed prospectuses of the Company, which may be obtained at the Office, 18, King William-street, City, or by letter, addressed to the Secretary.

WILLIAM RATRAY, Actuary and Secretary.

CORPORATION of the LONDON ASSURANCE:
Established A.D. 1720.

LIFE ASSURANCE.—Great advantages are offered to the public by this office:—

An annual abatement of premium after five years' payment.

A lower fixed rate without abatement.

Fire Insurance effected upon every description of property, including rent.

Assurances are also effected on ships and merchandise at sea, and going to sea. JOHN LAURENCE, Sec.

Offices—19, Birchin-lane, and 10, Regent-street. Attendance daily from Ten till Four.

PROVIDENT LIFE OFFICE, 50, REGENT STREET, FEB. 15, 1844.
BONUSES DECLARED, 529,306*l.* 17*s.* 7*d.*

NOTICE is hereby given, that all Persons who hold Policies in this Office may receive the present value of the Bonuses which have been added to their Policies, upon application at the Head Office, or to the Agents through whom the Policies were issued. GEORGE BEAUMONT, Actuary.

Just published by LONGMAN, BROWN, GREEN, and LONGMANS, price 1*s.*,

PRACTICAL HINTS ON NEW AND OLD MANURES. By JOHN DODDRIDGE HUMPHREYS, Esq., Author of "The Electro-Physiology of Man," &c.

"We can recommend it to our Agricultural friends as a very valuable and interesting work."—*Bell's Weekly Messenger.*

"To the scientific Agriculturist our author's 'Hints' are peculiarly valuable, as embodying the condensed results of his inquiries into the electrical phenomena now recognised as constituting the fundamental laws of vegetable life."—*Bell's Life in London.*

"His theory is in unison with known practical results."—*Farmer's Journal.*

N.B.—This pamphlet contains the particulars of the New Chemical Manure, HUMPHREYS'S FARMERS' COMPOUND, unrivalled for Turnips, and as a Top-dressing to be hoed in on Wheat, Hops, Potatoes, &c. Price 12*s.* per cwt. Manufactured by DAVY, MACKMURDO, & Co., 100, Upper Thames-st., London.

UNDER THE SUPERINTENDENCE OF THE SOCIETY FOR THE DIFFUSION OF USEFUL KNOWLEDGE.

Just published, complete, in cloth, price 10*s.*; or in Nine Numbers, price One Shilling each,

THE HORSE; its History, Races, Structure, Diseases, and Treatment. By W. YOUATT. With a Treatise on Draught. A New and Enlarged Edition, Re-written, and brought down to the present state of Veterinary Science. With an entirely New Set of Cuts, Drawn by Harvey.

CHAPMAN and HALL, 186, Strand.

In 8vo, boards, with very numerous woodcuts, price 10*s.* 6*d.*,

LINDLEY'S ELEMENTS OF BOTANY,
STRUCTURAL, PHYSIOLOGICAL, SYSTEMATICAL, AND MEDICAL.

Being a Fourth Edition of the "Outline of the First Principles of Botany."

Contents of the Work—I. STRUCTURAL and PHYSIOLOGICAL BOTANY:—1, Elementary Organs; 2, Compound Organs; 3, Root; 4, Stem; 5, Leaf-buds; 6, Leaves; 7, Food and Secretions; 8, Flower-buds; 9, Inflorescence; 10, Floral Envelopes; 11, Male Organs; 12, Disk; 13, Female Organs; 14, Ovule; 15, Impregnation; 16, Fruit; 17, Seed; 18, Acrogens, or Flowerless Plants.

II. SYSTEMATICAL BOTANY:—1, Linnean Sexual System; 2, Analytical Method; 3, Natural System; 4, Natural System of De Candolle (*this Part illustrated with Numerous Figures of the details of the more important Natural Orders*); 5, the Alliances of Plants; 6, Sketch of a New Distribution of the Vegetable Kingdom.

III. MEDICAL BOTANY; consisting of a Classified List of the Principal Medical Plants that are known in a living state in Europe; with an Explanation of the Purposes to which they are applied Medicinally.

TAYLOR and WALTON, and all Booksellers.

Just published, price 5*s.*,

THEORY AND PRACTICE, applied to the CULTIVATION of the CUCUMBER in the WINTER SEASON; with a Chapter on MELONS. By J. MOORE, Botanic Gardens, Regent's Park.

"This subject has engaged the attention of many writers, and has been given to the public in various forms; but never yet in a manner we could so cordially approve as the present. We do not hesitate to say it should be read by all."—*Florist's Journal*, April, 1844.

London: R. GROOMBRIDGE, 5, Paternoster-row.

Mounted in Cases adapted to the Waistcoat Pocket, 9*d.* each,

TRAVELLING and HUNTING MAPS of the ENGLISH COUNTIES. With all the RAILWAYS correctly laid down, as far as they at present extend, and the Mail and Coach Roads correctly Coloured.

Double the size, price 1*s.* 6*d.* each,

YORKSHIRE, IRELAND, SCOTLAND, AND WALES.

CHAPMAN and HALL, 186, Strand.

TERMS FOR THE PERUSAL OF NEW PUBLICATIONS.
Now ready, Gratis and Post-free,

THE TERMS OF SUBSCRIPTION TO THE BRITISH AND FOREIGN LIBRARY, Conduit Street, Hanover Square. Families in town or country are supplied with all the new and standard works for perusal in any quantity. The new catalogue is just published, comprising (besides a large collection of French and Italian works) the most esteemed productions in the following branches of English Literature:—

History.	Belles Lettres.	Voyages & Travels.
Biography.	Moral Philosophy.	Fiction—Poetry.
Divinity.	Political do.	The Drama.

SAUNDERS and OTLEY, Publishers, Conduit-street.

News of the Week.

THE Pamphlet on the French Navy, published last week by the Prince de Joinville, has attracted, as we anticipated, considerable notice on both sides of the Channel. In Paris it is regarded as a demonstration in favour of the war projects of M. Thiers, and the Prince is censured by the Ministerial press for having supplied the enemies of his father's government with such an instrument of intrigue. The frankness, however, with which his pamphlet exposes the inferior condition of the French Navy has failed to conciliate the republican party, and a still greater cause of disapprobation is the candour with which the Prince admits that the ports of France may be devastated by English steamers, within a few hours of the first declaration of war. The opposition papers generally applaud the project for creating a steam navy, relying on the assumption that, unlike the massive line-of-battle ships of the old system of naval warfare, a fleet of steamers would enable France to cripple our commerce and transport her armies to unprotected parts of our coast, so that by means of a power as yet unknown in European war, France may have the means of disputing with this country the dominion of the sea. These speculations are said to be uppermost in the political coteries of Paris, and they are expected to have great influence on the debate upon the supplementary credits which is now pending in the Chambers. Our own Journals, however, reply, that success in steam machinery still belongs confessedly to England; that there is no reason to doubt that our navy will excel as much in this new species of warfare as they did in the sailing ships of former times, and that whatever injury the creation of a steam fleet may enable France to inflict on England, the Government of this country will not be insensible to her movements, but will be prepared to enter upon the contest with the same weapons. The Prison Discipline Bill, which has been so long in progress, has passed the Deputies by a large majority, but the Bill on Secondary Instruction is still before the Peers, with little chance of its being discussed in the Deputies during the present session.—From Spain we have accounts of the preparations for the departure of the young Queen for the Baths of Catalonia, accompanied by the Ministers of France and England. This excursion, it appears, is likely to have an object beyond the restoration of her Majesty's health—the Count de Trapani, so long mentioned as the future husband of the Queen, being expected to meet her Majesty at Barcelona.—In Germany, the resolution of the Dukes of Saxony to assume the designation of Royal Highness, a title much higher than that assigned to them by the Congress of Vienna, is the chief topic of attention. The measure is said to be warmly supported by our own Queen, but opposed by the King of Prussia and the Emperor of Austria. The title, however, does not depend on the will of any single Sovereign, and the question must be decided by the Germanic Diet.—Civil war has again broken out in Switzerland, in consequence of the long-pending disputes on religious questions between the French and German inhabitants of the Valais, and an appeal to arms was hourly expected on the 18th.—The accounts from Turkey contain renewed details of the disturbances in Albania, and of the vigorous efforts making by the Porte for the purpose of suppressing them.—From the West Indies we learn that Hayti and Cuba are still in a state of rebellion; the mutual jealousies of the blacks and the mulattoes are likely to lead to a collision, and the end of the revolt, it is feared, will show a great sacrifice of life and property.

At home, with the exception of the reduction of duty on foreign wool, the most important proceeding in Parliament has been the adoption of Sir Robert Peel's resolutions on Banking, and the introduction of a Bill founded upon them. Mr. Ewart on Friday moved that the duty on foreign coffee be reduced to the same as on colonial, for the avowed purpose of striking a blow at the system of differential duties; but the motion was opposed by Government, and negatived on a division by 39 to 28.

Home News.

COURT.—The Queen and Prince Albert, accompanied by the Prince of Wales and the Princesses, left Buckingham Palace on Thursday for Claremont, where they will remain until Wednesday or Thursday next. Previous to her departure, her Majesty held a Court and Privy Council. At the Court, her Majesty conferred the honour of Knighthood on Mr. Thesiger, the Solicitor-General; and at the Council, Sir T. Fremantle, Bart., Secretary-at-War, was sworn in as a Privy Councillor, and took his seat at the board. The Prince will drive from Claremont, on Tuesday next, to be present at the Montem. His Royal Highness will lunch with the Provost and Dignitaries of the College, and return to Claremont to dinner. On Saturday, his Royal Highness transacted business at the office of the Duchy of Cornwall, and in the evening of the same day the Queen and Prince honoured the Italian Opera with their presence. On Sunday, her Majesty and the royal suite attended divine worship in the Chapel of the Palace. On Monday, the Queen and Prince walked in the Royal Gardens, and the Prince afterwards rode out on horseback. On Tuesday, the Queen took her daily walk in the Palace-gardens, and the Queen Dowager visited her Majesty in the course of the day. On Wednesday the Queen took her daily walk, and Prince Albert paid a visit to the Panorama, in Leicester-square. The report that her Majesty has purchased Norris Castle, in the Isle of Wight, has been contradicted. It is said that the King of Saxony will leave Dresden on the 25th for London, and then make a tour through England, Scotland, and Ireland, under the *incognito* of the Count Von Holmstein. He will be accompanied only by his physician, an Aide-de-Camp, and a Chamberlain. It is also said that circumstances of a domestic nature will prevent the visits of their Majesties the Emperor of Russia and the King of Hanover, at a period when it would be practicable for their Majesties to leave their respective dominions, and that neither of these Sovereigns will visit this country during the present season. The Crown Prince of Denmark, however, is expected to arrive in Scotland in the course of the week, for the purpose of examining the geological formations of the Highlands, but his Royal Highness will not extend his visit to London. Viscountess Canning has succeeded the Countess of Mount Edgcumbe as Lady in Waiting on the Queen; and Lord Byron and Colonel Drummond have succeeded Viscount Hawarden and Sir F. Stovin as the Lord and Groom in Waiting.

Ministerial Arrangements.—It is announced that Lord Talbot is to have the Garter vacant by the death of the late Earl of Lonsdale. Lord Granville Somerset has a seat in the Cabinet, retaining his present appointment of Chancellor of the Duchy of Lancaster. Sir T. Fremantle succeeds Sir H. Hardinge as Secretary-at-War, without a seat in the Cabinet. John Young, Esq., M.P. for the county of Cavan, and one of the Lords of the Treasury, succeeds Sir T. Fremantle as Secretary to the Treasury. The vacant Lordship of the Treasury has been given by Sir R. Peel to Lord A. Lennox, brother of the Duke of Richmond. Sir Hugh Pigot, Rear-Admiral of the White, has been appointed to the command of the Irish Squadron, in the room of Rear-Admiral Bowles, appointed one of the Lords of the Admiralty.

Parliamentary Movements.—The report that Sir H. Fleetwood intends to retire from the representation of Preston has been contradicted. — The death of Mr. Johnston having caused a vacancy in the Kilmarnock burghs, the Hon. P. Bouverie, son of Lord Radnor, and Mr. John Robertson, late editor of the "Westminster Review," have come forward as candidates in the Liberal interest; and Mr. H. Vincent, on the part of the Chartists.

Courts of Law.—The daily papers have announced that Sir Nicholas Tindal, Lord Chief Justice of the Common Pleas, has expressed his resolution to retire from the Bench at the expiration of Michaelmas Term; but the *Standard* contradicts this by stating that the Lord Chief Justice at present does not entertain any intention of retiring from public life.

Foreign.

FRANCE.—The Prison Discipline Bill, so long under discussion in the Chamber of Deputies, was passed on Saturday by a majority of 231 against 128. The measure is loudly condemned by the majority of the papers as hypocritical and cruel. In the Chamber of Peers the Bill on Secondary Instruction remains under discussion; the adoption of the 24th article of the Bill on Saturday, as amended by the Committee, and which deprives the University of all right to interfere with private establishments, promised to facilitate the work of the Chamber; but it is impossible that the Bill can be discussed by the Deputies in the present session.—The Paris papers are chiefly occupied with references to the pamphlet of the Prince de Joinville, the insurrection in St. Domingo, the union of Texas with the United States, and other foreign and domestic topics. In dealing with these questions, those journals, with few exceptions, contrive to make manifest

that hostility to England which has prevailed at intervals for so many years, and their desire to aggravate the spirit of national rancour which the conduct of M. Thiers in 1839 and 1840 may be said to have recalled into life. The Prince does not, however, escape censure from the identical portion of the press that it was said he had desired to propitiate. The republican prints are furious at the frankness with which he defends the conduct of M. Thiers in preventing naval hostilities with England in 1840, and at the candour of his admission that the seaports of France might be visited and devastated by a British naval force, in the event of a war. The opinions of the Prince were expected to have great influence in the debate on the supplementary credits, which commenced on Tuesday.—As the French railways have become objects of general attention to English capitalists, some account of their present position may be acceptable. The Bills now before the French Chambers, and which are expected to be passed this session, are these:—1. The line from Paris to the Belgian frontier at Lisle, with branches to Dunkirk, Calais, and Boulogne. 2. From Orleans to Vierzon. 3. From Paris to Dijon and Chalons, commonly called the Paris and Lyons line. 4. From Orleans, through Tours, to Bordeaux. 5. From Montpelier to Nismes. All these have been considered in committee, and leases will be granted this session for all of them. Last week the Minister of Public Works presented the four following additional bills, comprising about 500 leagues of railway:—6. An extension of the Orleans and Vierzon line to Chateauroux and Limoges to the south-west, and to Bourges and Clermont on the south-east, the utmost limits to which the lines through the centre of France are proposed to be carried, because of the physical difficulties of the districts. 7. The extension of the west line from Tours to Nantes. 8. An extension of the Paris and Versailles line (left bank) to Chartres, with a view to the ultimate extension to Lemans, Laval, Rennes, and probably to Brest, thus completing a great north-western line, which was not included in the general law of June, 1842. 9. The line from Paris to the German frontier at Homaarting, commonly called the Paris and Strasburg line. In the four last-mentioned lines the Minister merely asks a vote for the construction of the works, deferring the authority to grant leases to any company to another year. It was expected that the line from Bordeaux to Toulouse and Marseilles (to unite the Atlantic with the Mediterranean), and the line from Lyons, southward to Avignon, would have been included in the presentations this session, but they are definitively postponed till next year, although a company was actually formed, and the capital subscribed, for the latter, who asked the land for the railway as the only assistance required from the State.—The King and Royal Family have removed to Neuilly, where they will remain until the close of the Session.—The death of Admiral Lalande was announced in the Chamber of Deputies on Tuesday. His death is a great loss to the French Navy, of which he was one of the most distinguished officers. He commanded the Mediterranean fleet in 1840.—Accounts from Algeria state that on the 24th ult. an engagement took place between the Kabyles and the column commanded by the Duke d'Aumale in person. A dense fog which prevailed at the time caused a panic among the soldiers of the Goum, who marched on the flank of the main body, and their precipitate retreat occasioned some confusion in the ranks. The Arabs were repulsed, but, it would appear, not without a serious loss on the side of the French. One account estimates at 21 the number of their killed, whilst others state that they had 13 officers and upwards of 100 men put *hors de combat*. Two pieces of artillery captured by the Arabs were recovered. During the contest the Duke d'Aumale, closely pressed by the assailants, had been saved by a field-officer. His horse had been pierced by three bullets, and that of an officer riding close to him by five.

SPAIN.—Accounts from Madrid state that the Queen, the young Infanta Donna Louisa, and the Queen Dowager Christina were to leave Madrid on the 20th, accompanied by General Narvaez, the Foreign, Home, and Marine Ministers, and a brilliant suite. The Royal party were expected at Valencia on the 27th, from whence they will embark for Barcelona, on board a Government steamer. After remaining at Barcelona two or three days, her Majesty will proceed to the baths of Caldas, where she will remain six weeks or two months, and return to Madrid through Aragon, Navarre, and the Basque provinces. Mr. Bulwer, our Ambassador at Madrid, has had an interview with the Queen, for the purpose of intimating to her Majesty that his Government wish to place the British squadron, now on the south coast of Spain, at her disposal. The English steam-frigate Vesuvius arrived at Barcelona on the 12th, and left for Valencia on the 18th, to take on board Mr. Bulwer and his suite. The Belvidera, 46, is daily expected at Barcelona from Tunis; and she, together with the Scout, 18, and the Vesuvius, will remain at Barcelona during the Queen's sojourn at Caldas. It was stated that the Count de Trapani, brother of the King of Naples, who has been so long mentioned as the future husband of Her Majesty, will have an interview with the young Queen at Barcelona, and that the authorities of that city had written to Madrid for instructions respecting the reception they should give to the Prince. It is considered probable that the Cortes will not be convoked before the return of Her Majesty from this excursion. M. Armero had accepted the Department of Marine in the new Cabinet; and the Marquis de Villuma, late Ambassador in London, had accepted the post of Foreign Minister. The Queen Mother reviewed on the 10th the regiment of the Reina Gobernadora, of which she is Colonel, and conferred with her own hands several decorations on officers and soldiers of that corps. The Portuguese refugees had been well received by the Spanish authorities. On their arrival at Ciudad Rodrigo they were awarded a month's pay, and at Salamanca Count de Bomfim and several of his companions had dined with the Captain-General. Borgo de Osma had been assigned to them as a residence.

PORTUGAL.—We have accounts from Lisbon to the 13th. A lull in the political world appears to have succeeded the late disturbances. The Cortes it was supposed would open on the 23d. The Government, since the suppression of the revolt, had acted with mildness, and used their victory with moderation. The acknowledged embarrassment of the finances seems to be the great matter of consideration with the Government. Mr. Tozer, an English gentleman, has been imprisoned for some imprudent word at Coimbra and Lisbon, without any particular charge against him, and, consequently, no hope of either justice or trial.

BELGIUM.—A fatal accident occurred on the railroad from Brussels to Antwerp, on Friday, at a station four miles from the latter town. The fast train, which was passing the station about five o'clock was, while in full progress, thrown off the line, and brought in contact with a luggage-train. The concussion was fearful; three persons were killed, fifteen severely wounded, and about forty received contusions, more or less serious. The accident is said to have been occasioned by the carelessness of the railway servants in attending to the points, so that at the junction with the Ostend line the carriages were thrown off the line, and came into collision with the baggage-train. Strange to say, the engine, the tender, and one carriage continued upon the proper line, but were violently separated by the concussion from the remaining carriages. Another account states that the rail was under repair, and that one rail, which had been replaced, was imperfectly bolted and fastened at the extremity towards Brussels. As the train passed over it the fastening was loosened, and after the passage of the first carriage the end tilted up, caught the wheel of the next carriage, which was thrown off the line, and thus occasioned the accident.

GERMANY.—The resolution of the Dukes of Saxony to assume the title of Royal Highness is the topic of the day in the higher circles of Berlin and Vienna. This measure, it would seem, has seriously displeased the King of Prussia; and Baron Bülow, the Minister of Foreign Affairs, is said to have replied to the Saxon Minister's notification on this subject that no answer would be the best mode of treating it. A lively correspondence, however, is observed to take place on this subject between Count Trautmansdorff, the Austrian Ambassador at Berlin, and Prince Metternich, and until the result thereof is known, all Prussian Government officers have received orders in their official communications to continue the style of Serene Highness. It is asserted that Queen Victoria, in an autograph letter to the Emperor, has requested his Imperial Majesty's intervention with the German Diet to procure that body's consent to the title of Highness, but that the Emperor, from the very beginning, referred the matter to the King of Saxony, as head of the family. The general opinion at Berlin is, that Austria and Prussia will not recognise the title of Royal Highness.—The celebrated singer, Mdlle. Jenny Lutzer, lately under an engagement at one of the Imperial Theatres of Vienna, is just married to M. Charles Dingelstadt, a poet, and member of a family of distinction in the law. On the day of marriage, the Emperor conferred the title of Aulic Counsellor on the bridegroom, which gives the *entrée* at Court. The bride retires from the stage.—His Royal Highness the Grand Duke of Hesse has remitted the sentence of six months' imprisonment passed upon the Baron de Haber, as the principal in the late fatal duel, and he is now at liberty, after six weeks' imprisonment in the fortress of Babenhausen.

SWITZERLAND.—A supplement of the *Nouvelliste Vaudois* of the 19th May, at noon, announces that civil war has broken out in the canton of Valais. The inhabitants of the Upper Valais have seized on Sion; those of the Lower Valais have risen *en masse*. Each party have some pieces of cannon, and a battle was imminent on the 18th. This contest has arisen out of the long-standing disputes between the German and High Church Catholics of the Upper Valais and their French and latitudinarian compatriots of the lower portion of the canton. Two years ago the Upper Valaisans were beaten, and the democrats gained the ascendancy. This year, the upper party, having a Vorort, or executive canton (Lucerne) favourable to ultra-Catholic ideas, are the most powerful, and the result is an appeal to force.

ITALY.—A letter from Naples, quoted by the *Augsburg Gazette*, has the following:—"The Duke de Montebello has opened negotiations with the Court of the Two Sicilies, and has lately taken repeated excursions to Caserta. The object is believed to be a marriage between the Duke d'Aumale and the Princess Maria Carolina, sister of the King of Naples, whose hand has been also demanded for the Duke de Bordeaux, a projected union which would be thus defeated, and for the promotion of which, a letter from Friuli says, the elder branch of the house of Bourbon has actually sent off an ambassador. Then comes the proposed alliance between Queen Isabella of Spain and the Count de Trapani, which is not yet renounced."—Accounts from Malta state, in reference to the late events in the North of Italy, that the disaffection seems to have extended to the Austrian, as well as the Roman States. The Austrian Government has deemed it necessary to put Venice in a state of *quasi* siege. Its garrison has been increased to 11,000 men. One frigate is constantly and openly kept with her guns turned against the city. Defections in the Austrian army still continue, and 20 Italian and Hungarian officers are said to have disappeared from the corps in which these two nations serve promiscuously. The last news from Milan states that a strong band had appeared on the Lombardian hills, to which are attached some youth from the highest families of Lombardy. The Court of Vienna has showed itself very much alarmed at these preliminaries, and had offered a free pardon to the sons of Rear-Admiral Bandiera, in order that they may return to their posts; but they had declined it, and retired to Corfu.—A letter from Bologna, of the 12th says:—"The Government has just published the sentence pronounced by the military commission against the second category, which comprises the persons imprisoned at Saint Leo, and who are accused of having taken part in the expedition of Imola on the 8th of September last. By this sentence three persons are condemned to perpetual imprisonment with labour, five to 20 years, 29 to 15, and one to 10. Two have been condemned to three years' simple imprisonment. Only one has been set at liberty, and that only provisionally."

GREECE.—Letters from Athens of the 30th ult. state, that the members of the Holy Synod having, at the instigation of Russia, declined to take the oath to the Constitution, M. Mavrocordato gave them 24 hours to consider of it, threatening, in case of refusal, to dissolve their body, and appoint others in their place. The firmness displayed by the Minister had the effect of removing the scruples of the Bishops, and after offering some apology for their resistance, they complied with the required formality.—The inhabitants of Syra have given a splendid banquet to Sir Edmund Lyons and M. Piscatory, the Ministers of England and France.

TURKEY AND EGYPT.—We have accounts from Constantinople of the 27th ult. They announce that Hussein, Pacha of Vrania, has sustained a serious defeat, having been compelled to evacuate that place on the 12th ult., and to fall back precipitately upon Monastir, pursued by an army of 12,000 Albanians. Great excesses are said to have been committed by the latter, who plundered and set fire to the town of Egri Palanka. The Porte is at length making the most strenuous efforts to put down this rebellion as quickly as possible; the garrison of Constantinople has been reduced to less than half the force to which it amounted a few months ago, by the detachments which have been successively sent to Adrianople and Salonica.—A Prussian family, composed of a married couple, with their daughter, a pretty young woman, had presented themselves at the Porte, and formally embraced Mahommedanism. The reasons for their apostacy were as follow:—One of the young Officers sent by the Turkish Government to complete his education at Berlin having become enamoured of the damsel, agreed to marry her, provided she would accompany him to Constantinople and change her religion. To these conditions she declared she had no objection; but refused to be separated from her parents. The latter, however, showed themselves truly accommodating, and the difficulty was overcome by the whole family turning Turks.—The persons implicated in the last conspiracy in Servia against the Prince Alexander Georgiowitsch, have been pardoned, and the two chiefs of the revolution which placed him on the throne, Wucsicz and Petroniewitsch, and who had been exiled on the demand of Russia, have been authorised to return to Servia.—We have letters from Alexandria of the 25th ult. The Pasha had caused the Schah Soliman Beddreddin to be hanged at Cairo for concealing several fellahs, who had been ordered to return to their native villages. Mehemet Ali was then at Minetilgamh, in Lower Egypt, engaged in devising measures for the destruction of the wild boars which infested the country. Three regiments had been directed to repair thither from Cairo for that purpose. Arif Bey, who occupied some years ago a high post at the court of the Pasha, had been sentencod to the galleys for the exactions of which he had been guilty, and had arrived, loaded with chains, in the arsenal of Alexandria.

MOROCCO.—The following telegraphic despatch from the French Consul at Tangiers, has been received in Paris:—"There is reason to apprehend the arrival of the Kabyles here from the interior. The Consular body have written to the Pacha to protest beforehand against this infraction of the general orders of the Emperor. The British agent has called for the naval forces at Malta. I (the French Consul) have recalled the Cygne. A reply in the negative is expected to the Spanish ultimatum. In that case the Consul-General of Spain will strike his flag and embark, if he can succeed in doing so."

WEST INDIES, &c.—By the Clyde mail steamer we have accounts from Jamaica to April 24; Barbadoes to April 21; Demerara, to April 20; and from the other islands to corresponding dates. They give a lengthy account of the state of affairs in Hayti, which is quite as deplorable as before represented. Many of the fugitives had arrived at Kingston to seek a home, and the Assembly had made a small grant to provide for their wants. English interests in Hayti and Cuba are stated to be in a precarious position; and the end of the revolt, it is feared, will show a vast sacrifice of both life and property. One of the Jamaica papers, the *Morning Journal*, of April 23, contains the following paragraph on the state of Cuba:—"We have been informed that very serious proceedings have lately taken place in the Island of Cuba. A gentleman lately from St. Jago, and a person of respectability, who arrived in the

packet on Saturday last, has brought intelligence of a sudden insurrection among a portion of slaves; and that from forty-five to fifty Englishmen were tried, condemned, and executed for having advocated the cause of freedom. It is reported that there are about 300 British subjects now in prison at the Havannah awaiting their trial, and who will most likely share the same fate."—The latest accounts from Hayti show that the island is still in a most unsettled state, and, what with the attempt of the inhabitants of the Spanish portion to achieve their independence, and the disposition of a part of the French to possess themselves of the towns, the President Herard's position was far from enviable. The larger part of the army with which he marched upon St. Domingo were blacks, and the general opinion at Jamaica was, that they were jealous of, or disaffected towards, the browns. Such was, in fact, the universal idea, so that there seemed to be no small probability of their turning their arms upon their leader.—Affairs in the West India Islands have undergone no material change since the last arrival. Business continues flat, and small prospect of improvement appears to present itself. Mr. Thomas, the manager of the Bank in Barbadoes, had been found guilty of robbery, and sentenced to a term of imprisonment with hard labour. The weather in some localities had been rather more favourable for the crops.

Parliament.

HOUSE OF LORDS.

Friday.—After the business reported in our last, the Bishop of EXETER presented a petition from several gentlemen, belonging to different societies established for the reclamation or improvement of women who had become the victims of seduction, praying their lordships to devise some statutory remedy for saving innocent females from being deluded by the artifices and conspiracies of seducers. The Right Rev. Prelate then laid on the table "A Bill for the more effectual Suppression of Brothels and Trading in Seduction and Prostitution." The Bill was read a first time.—Lord WHARNCLIFFE called the attention of their lordships to the report of the committee appointed to inquire into the progress of the building of the two Houses of Parliament. His object was to get rid of what appeared to him a most improper practice on the part of Mr. Barry, that of making alterations in the building of the houses without the knowledge of the Treasury, the Board of Works, or Parliament. A commission, appointed after the burning of the old houses, had adopted the plan of Mr. Barry, making, however, certain alterations in details; and this amended plan had been approved of by a committee of both Houses of Parliament. A committee appointed to make inquiry into the progress of the building had ascertained that alterations had been made in the plan by Mr. Barry, which had not received the sanction of any competent authority; and these alterations were not matters of mere detail or taste, but affected the arrangements connected with the accommodation of the Sovereign.—Lord SUDELEY, who had been a member of the commission appointed to decide on a design for the erection of the new houses, stated that ninety-seven plans had been sent in, each comprising ten or twelve drawings, and involving, therefore, a laborious and painful examination of from a thousand to twelve hundred. After much labour, they decided on approving of the plan of Mr. Barry, considering that, with necessary alterations as to internal accommodation, it was the best as to grandeur of design and external beauty. The commission stood sponsors for this plan, as amended, and having been examined before a committee of the House of Commons, of which Sir R. Peel was an active member, they had declared their approbation of it, admitting, at the same time, that other plans were equal to it in the matter of internal accommodation. The noble lord then explained in detail the nature and effect of the deviations introduced by Mr. Barry into the plan, as originally approved.—The Marquis of LANSDOWNE said, he did not justify Mr. Barry in making the alterations on his own responsibility, but suggested the propriety of settling who were to be the advisers of the architect; and Lord BROUGHAM condemned the whole affair, from the original design down to the recent alterations, as a proof of the barbarous Gothic taste of our time, which was erecting in the 19th century a building worthy only of the 9th century.—The Marquis of CLANRICARDE and Lord COLBORNE joined in the discussion, and the report of the committee was ultimately referred to the Board of Works.

Monday.—Lord WHARNCLIFFE moved the second reading of the Factories Bill, and shortly explained its provisions.—The Marquess of NORMANBY justified his change of opinion on this question; and objected to the Bill because it did not go far enough. His conviction now was, that the Legislature, when once they interfered, were justified in stopping at that point only where they would restrict the hours of labour to the hours used in all other parts of the world, where masses were combined at one kind of work. He made severe strictures on the conduct of Government upon this measure, and the sudden and extraordinary changes of opinion on the part of several members of the Lower House, which the division list exhibited. Lord Normanby, feeling that he would have no chance of successfully opposing this Bill, said he should vote for its second reading, but under protest.—Lord BROUGHAM protested against the Bill for interfering at all betwixt the employer and the employed. He dilated with considerable warmth upon the "primeval curse," and argued that, because he could adduce instances of great hardship and toil in agricultural employments, therefore the Legislature had no right to interfere to remedy the miseries of the manufacturing labourer. He had seen many reports of the sufferings of children and other persons in factory labour, but he pledged himself, if ever the case was brought under discussion, to bring such a frightful picture of the sufferings of the farm labourers—scantily clothed—hardly worked—exposed to the blast and to the rain and to the snow—coming home to a badly-warmed cottage, through every corner of which the winds find an access and an exit—condemned to lie upon a bed which cannot, by possibility, be ever dry in counties where fuel is scarce—such a picture as would make the humanity mongers shudder with horror.—The Earl of WINCHELSEA spoke strongly in favour of a ten hours restriction, and, so far as his experience went, denied the correctness of the picture drawn by Lord Brougham. He considered the Bill to be a great improvement of the existing law, but wished that the hours of labour had been limited to ten.—Lord CAMPBELL expressed a contrary opinion; the Earl of HADDINGTON vindicated the Government; and after some observations from Earls MINTO and FITZWILLIAM, and from Lord WHARNCLIFFE in reply, the Bill was read a second time.

Tuesday.—Lord BROUGHAM laid on the table a Bill to amend the Act for the Abolition of Imprisonment for Debt, which was read a first time.—Lord BEAUMONT called attention to the case of the Maltese tried for murder at Tunis, considering it a matter to which the attention of Government should be specially directed, for if the unwarrantable interference of the French consul at Tunis was tolerated by this country, our trade along the Barbary coast would soon be at an end. He moved for the production of the correspondence between the Foreign-office and Sir T. Reade, our consul at Tunis, relating to this matter.—The Earl of ABERDEEN replied, that the difficulties attending the subject of jurisdiction in the Levant were very great—a fact of which Lord Campbell was well aware, as he had endeavoured to introduce a measure which would obviate them. A bill, however, introduced by himself, was now the law of the land, which, he hoped, would enable them to apply a remedy. The particular case referred to by Lord Beaumont was that of a deliberately planned and cold-blooded murder, perpetrated in open day; and the course which Government had pursued was consistent with existing treaties, and had the sanction of the highest legal authority. The matter was not one which could properly be discussed in the House, as the Government were in communication with the respective Governments concerned. As a proof that they were not indifferent to the rights of British subjects in the East, or neglecting British influence in that quarter, he mentioned that they had recently induced the Porte to abandon the practice by which Christians who had embraced Mahommedanism were put to death if they relapsed. He consented to the production of the correspondence.

Thursday.—The Royal assent was given, by commission, to the following Bills:—The Eastern Counties Railway Bills (Nos. 1 and 2), the Selby and York Railway Bill, the South-Eastern Extension Railway Bill, the Furness Railway Bill, the Darlington Junction Railway Bill, the Hartlepool Dock and Harbour Bill, the Coal Mining Company Bill, and several Inclosure and Naturalisation Bills. The Lords Commissioners were the Archbishop of Canterbury, the Lord Chancellor, and the Earl of Shaftesbury.—The Marquess of CLANRICARDE moved that their lordships would not insist upon retaining as part of the Lancaster and Carlisle Railway Bill the clause which had been added to it (by Lord Brougham), but which the House of Commons refused to agree to, because it was in violation of their standing orders. This clause, which gave a power to the railway company to erect gates upon the Queen's high road, three quarters of a mile distant from the railway, for the purpose of complying with a stipulation entered into between them and Lord Brougham, for whose sole interest the gates were to be erected, had been introduced by Lord Brougham on the third reading of the Bill, contrary to the standing orders of their Lordships' House, and had been objected to by the House of Commons, upon a conference, as being irrelevant to the Bill, and fit only to be dealt with as part of a Turnpike Act.—Lord BROUGHAM, after the motion of Lord Clanricarde, rose in an excited state, and said that he was taken by surprise, for he had given notice of his intention to move for a committee to investigate the matter. He then charged Lord Clanricarde with having thwarted him in this instance from a personal or party motive. Had this been a railway, he said, passing near Lord Melbourne's estate at Brockett Hall, or Lord Cottenham's villa at Wimbledon, he did not believe the noble Marquess would have exhibited so much public virtue or personal alacrity. Lord Brougham prayed their lordships for a postponement of the question, in order that in the meantime he might have an opportunity of coming to some arrangement with the Company.—The Marquess of CLANRICARDE, with considerable vehemence of tone and manner, repudiated being influenced by any party or personal feeling. He intreated their lordships not to postpone for a week the passing of an important public Bill for such a purpose as that of giving time to Lord Brougham to make new terms with the Company. The Company was willing to put up twenty gates if the House wished it, but then they could not compel the House of Commons to agree to this clause.—Lord CAMPBELL said there could be no doubt that the clause had been improperly introduced; but his noble and learned friend having been his own counsel in the matter, had not a very wise man for his client. Lord Campbell appealed to the chairman of committees for his opinion on the introduction of the clause.—The Earl of SHAFTESBURY gave it as his opinion, that to bring up any such clause on the third reading was irregular; and that if, as reported, the gates were to be erected three-quarters of a mile from the railway, this clause was entirely irrelevant to the Bill.—The Earl of DEVON moved that the debate be adjourned, in order to give his noble and learned friend time to make a compromise with the company.—Lord BROUGHAM again rose, and confessed that he was almost ashamed to trouble the House with a personal and trumpery matter. But he had, he said, been trepanned into giving up his opposition to the Bill, thinking that his terms would have been complied with, and that was a matter of great public importance. He certainly thought that the present occasion had been looked on and used as a good opportunity of doing a thing not very agreeable to an adversary, and in reply to Lord Campbell's remark, that a man who is his own counsel has generally a fool for his client, he could only say that such a counsel, at least, would never abandon his client's cause.—Lord CAMPBELL here interrupted his Lordship, and said amidst much laughter, "Were I the advocate in this case, I should abandon the clause—for the sake of the character of my client."—Lord CLANRICARDE again rose, and repelled with indignation the charge brought by Lord Brougham, that he had been influenced by personal motives; he rebuked the noble and learned lord for overrating himself; he had great abilities and eloquence, but other and higher qualities were requisite to the formation of a great man. As to the Whig party which he had deserted, they did not care for his opposition.—Lord BROUGHAM rose and affirmed that he had good Whig authority for abandoning his party, inasmuch as Earl Grey himself had written to Lord Howden, stating that, if he were present in Parliament, he would support the Government.—The Earl of RADNOR had heard of noble lords sitting on committees, and making terms for carrying their opposition to Bills; but never before had he heard anything so extraordinary as that a noble Lord (Lord Devon) should get up and propose an amendment to adjourn a debate, in order to enable another noble Lord to make good terms with a railroad company.—The Duke of WELLINGTON stated that he had himself, when a railway was proposed which crossed the high-road on a level, insisted upon the company's placing gates for the public security. He believed that Lord Brougham's case was similar to his.—Lord MONTEAGLE set the noble Duke right. He had made his stipulation with the company solely for the public benefit; Lord Brougham had made his solely for his own advantage. There lay the difference between the Duke of Wellington's and Lord Brougham's motives for supporting or opposing public measures.—After some further discussion their Lordships divided—For Lord Clanricarde's motion, 32; for the adjournment, 31; majority, 1. Notwithstanding this decision, Lord BROUGHAM moved—"That a select committee be appointed to consider the amendments made by the House of Commons in this Bill." Such a committee having been condemned by all the authorities in the House as one that could not be granted, the noble and learned Lord, after several attempts to remodel it, was compelled to relinquish it altogether. His Lordship said—"As your Lordships seem agreed, I shall withdraw my amendment; but I shall take good care to look after those parties when they come with their next Bill for an extension of their line." The Bill then passed without Lord Brougham's clause.—The Customs Duties Bill was read a first time.—On the motion of Lord COTTENHAM, the Debtors and Creditors Bill was committed *pro formâ*, to admit of alterations.—Their Lordships then adjourned to Thursday, the 30th inst.

HOUSE OF COMMONS.

Friday.—After the preliminary business, noticed in our last, Mr. LABOUCHERE complained, that in consequence of the import duty on staves, our coopers were undersold by foreign cask-makers, and some hundreds of workmen thrown out of employ. The necessary relief might be given without at all re-opening the question of the timber duties.—Mr. GLADSTONE said, that much had lately been done for the relief of the coopers, but that he did not wish to exclude the consideration of still further measures for their relief.—Lord J. RUSSELL contended for such a larger application of the principles of free trade to timber as the late Government had sought to introduce.—Mr. HUME, Lord HOWICK, Mr. BARING, and several other members, contended for the principle of remitting duties upon raw materials.—The SPEAKER then left the chair, and the House went into committee on the Customs' Duties Bill, a desultory discussion arising on the various clauses. One leading topic of discussion arose on the proposed reduction of the duty on foreign coffee.—Mr. RICARDO called attention to the petition of certain holders of Ceylon coffee, who complained that, having been led into the belief that the Slave Trade was an insuperable barrier to the introduction of slave-grown products, they were now taken at a disadvantage by the proposed reduction in Brazilian coffee.—Mr. EWART proposed that the duty on foreign coffee be reduced to the same as on colonial—that is, 4*d.* a lb. He admitted that his object was to strike a blow at the whole system of differential duties, which he condemned as unsound in principle, injurious in operation, and unlikely to last.—The CHANCELLOR of the EXCHEQUER was not prepared to abolish all differential duties. The colonists were British subjects, and entitled to a fair share in that protection afforded to the mother country. The example of the United States was held up to them; but if he had wished for an example, in justification of the principle of differential duties, he would point to its tariff.—Mr. EWART here interposed, and said he only held up the example of the United States in the matter of coffee and tea.—The CHANCELLOR of the EXCHEQUER retorted, that they did so for the best of all reasons—the States grew neither coffee nor tea, and had no coffee or tea interests to protect. The Government in proposing to reduce the duty on foreign coffee to its present amount, were desirous of affording increased facilities to the home consumer, without exposing the colonial producer to unfair competition, by an undue reduction of the differential duty.—After some debate, a division took place, when the amendment was negatived by 39 to 28.—Mr. Alderman HUMPHERY, Mr. WARBURTON, and Mr. BRIGHT attempted to introduce into the discussion certain minor articles not the subjects of the present Bill, such as apples and canary-seed, chiefly with a view to impute that the county of Kent had been unfairly favoured in point of protection through the Cabinet influence of her representative Sir E. Knatchbull.—Sir R. PEEL protested against this irrelevant debate upon extrinsic topics, and observed that the tariff, so far from favouring Kent, had reduced in a very large proportion the most important of all her productions, in lowering so materially the duty upon hops.—In coming to the enactment for the abolition of the duty on wool Mr. GLADSTONE said he recommended this abolition, not on the ground that it would occasion but a small sacrifice, such as the British grower ought cheerfully to bear for the sake of the public interest, but on the ground that the British grower would positively be a gainer by it. He showed from official returns that when the duty on foreign wool had been increased, the export of woollen manufactures had diminished, and the price of wool had fallen. And within the last 20 years, that year in which the price of wool was lowest, was also that in which the import of foreign wool was smallest; while the year in which the price of wool was highest, was also that in which the import of foreign wool was greatest. In truth, the British and the foreign wool were not articles competing with each other, but articles mutually advantaged by being wrought up together.—Mr. MILES regarded the abolition of the duty as another movement towards free trade. The present moment seemed very unsuitable for the experiment, as the woollen manufacture was rapidly recovering from that depression which it had shared with others of our staple productions, and was increasing at a rate which was calculated to excite fears for the future. The abolition of the duty, though it would not benefit the consumer, would be beneficial rather than otherwise to the English grower: but it would interfere with our rising Australian colonies, whose wool growth had been stimulated by the little protection which the duty afforded.—Mr. C. WOOD, Mr. TROTTER, and other members expressed their persuasion that this abolition would both benefit the wool growers and encourage the woollen manufacturers.—Mr. DARBY approved the abolition, but protested against its being carried as a measure of free trade.—Mr. LABOUCHERE reminded him that the First Minister had explicitly asserted the principle of carrying that principle into complete execution.—Mr. DARBY said that the free trade which he objected to was that of the Opposition, which he regarded as a very different thing from that of the Ministers.—Mr. LABOUCHERE desired to have it understood that he had never contended for a total and abrupt abolition of all protections, without regard to existing interests.—Sir R. PEEL avowed that these reductions were intended in fulfilment of the principle which he had laid down at the time of the tariff, that all restrictions on commerce ought to be removed when their removal could be effected without injury to existing interests.—The Bill having gone through committee, the Stamp Duties Bill passed the same stage, after a division on the scale of duties, which ended in favour of the Bill.—On the motion of Mr. WYSE, a select committee was appointed to inquire into the subject of the law with respect to the art-unions, in order to see how far the parties engaged in those unions could be exempted from penalties to which they are liable according to the present state of the law, but to which it could not have been the object of the Legislature to subject them, and to report thereon.—Sir J. GRAHAM gave notice that after the Whitsuntide holidays, he should move for a select committee to inquire into the Gilbert Unions.

Monday.—On the motion of Mr. GLADSTONE, a proposition to reduce the deposit on railway speculations from ten to five per cent. was, after some discussion, agreed to; Sir R. Peel chiefly urging it on the ground that it would facilitate the passing of the Bill for the construction of the Dublin and Cashel Railway. The House then went into Committee on the resolutions respecting the proposed change in the system of banking.—Sir R. PEEL declared that he adhered to the principles already propounded by him, and that what he now proposed to do was chiefly to give some explanations upon points of detail. He would suppose that the country circulation was eight millions; that the country banks might desire, by agreement with the Bank of England, to reduce it to four millions; and that it might become necessary—which, however, would not be matter of course—for that establishment to make fresh issues in order to supply the vacuum. The cases then in which he would allow the Bank to do so, would be those of a country bank failing, or closing, or commuting its own circulation for that of the Bank of England. With respect to the question whether the bullion on which the Bank of England was to issue its notes should be allowed to include silver, he proposed that silver should be so included; but without at all departing from the great principle that there must be but one standard, and that standard a gold one: all he meant was, that if a party chose to bring silver to the Bank, the Bank might, within a certain limit, give its notes in exchange for it. If this were not permitted, the Bank, having no interest in keeping a supply of silver, would probably cease to keep it; but it was important to the country to have access to such a supply, not only for domestic circulation, but with reference to foreign commerce, especially with India and China. He would therefore propose to permit an issue of notes upon silver bullion in the proportion of one fifth of the whole, or one part in silver to four in gold. With respect to banks of issue, he would leave them their circulation until Parliament should make further order, and he would compute that circulation upon the average of what was its amount from the 6th May, 1842, to the 6th May, 1844, requiring henceforth a weekly publication of it. Where one bank should have taken the business of another, the benefit of the averages of the extinguished bank should be given in the circulation of the averages of the surviving bank. If a bank should increase its branches, yet it must not be allowed to increase the total of its issues. If private banks should coalesce, the consolidated concern, being still a private bank, should be permitted to retain the benefit of the circulations of all the component banks, but he would not permit a change of character; he would not authorise a *joint-stock* bank to buy up the circulation of private banks. He then explained the way in which he intended that the new plan should operate

with respect to those banks which have been issuing Bank of England notes; and announced that the Bank of England was prepared to enter into negotiations with other banks for arrangements under which its notes should be circulated by them. He had been taxed with leaving his argument imperfect by an omission to show in what way his plan would let in the operation of the foreign exchanges upon the home issues. Now, he considered that when he destroyed the tendency to unlimited issue from unrestrained competition, he removed the obstacle to the natural and due operation of the exchanges. There had been three great cases in which the currency had been endangered by the refusal of the country banks to contract their issues with reference to the foreign exchanges. These cases occurred in 1825, in 1834, and in 1838. At each of these periods the bullion in the Bank was diminished to a very large extent; and yet, in the face of that fact, the country banks, at each of these same periods, very largely increased their circulation, simply because there were then high prices by which speculation was stimulated. The consequence had been an alarmingly long list of failures among the private banks: in the one year, 1840, there had failed no fewer than 24, of which 17 had paid no dividend. It was easy to say that people need not take country notes; but the poor could not help it. He then gave a series of instances of unjustifiable issues by private bankers, terminating in their own ruin and that of multitudes of confiding poor. He had believed that there was a general persuasion of the necessity for putting an end to such a state of things. He was anxious to put an end to it safely; to encourage arrangements between the country banks and the Bank of England, and to discourage the existing system of coining credit into currency. It had been pressed upon him, that legitimate accommodation to the agricultural and other interests would be precluded by this alteration; but no country bank could issue notes even now in the district within 65 miles round London, and yet that district suffered no inconvenience from want of legitimate accommodation. It was no just argument to say that the Bank had not always acted upon sound principles; the management of the Bank was now conducted upon more enlightened views than formerly, and its directors were not to be judged by what they had been compelled to do under the irregular action of the present system of country banks.—Mr. C. Wood followed at considerable length in support of the proposal; Sir W. Clay, Mr. S. Wortley, Mr P. M. Stewart, Mr. M. Gore, Mr. F. Baring, and other Members also spoke in its favour.—Mr. Plumptre, as a private country banker, thought that hard measure had been dealt out by the limitation of the future provincial issues to the average of the last two years.—Mr. Muntz thought that Sir R. Peel was going the right way to prove whether he were right or wrong in his monetary principles, and if his plan were successful, then, of course, those who differed with him must submit to the demonstration of their error. But he doubted the possibility of restricting our currency, with a corn-law which made provisions fifty per cent. higher in this country than on the Continent.—After a few words from Mr. Gisborne, Mr. C. Buller, Lord Worsley, and Mr. Darby, the resolutions were agreed to unanimously.—Sir R. Peel announced that the Bill to be founded on these resolutions would be introduced before the recess, and stated that with respect to the introduction of the new regulations, he apprehended that there would be no objection on the part of the Bank of England, to have them take effect as soon as the necessary arrangements could be made; and that in anticipation of the consent of Parliament, the Bank was now making arrangements for the separation of the two departments.

Tuesday.—Several petitions were presented, and notices of motion given for future days. Among the former were a large number against the Dissenters' Chapel Bill.—Several Railway Bills were advanced a stage.—Mr. Borthwick rose to move for a committee to inquire into the operation of the Anatomy Act, and into the allegations contained in a petition of Mr. Roberts, presented on the 25th March last. He was proceeding to state the defects of the existing Act, when the House was counted out.

Wednesday.—After numerous petitions had been presented, Mr. Warburton brought up the report of the Medical Poor Relief Committee, which was ordered to be printed.—On the motion of Sir G. Clerk, leave was given to bring in a Bill to carry into effect the existing treaties for the suppression of the slave trade.—The Forestalling and Regrating Prevention Bill was read a second time.—The report of the resolutions on the Banking was received, and a Bill founded on them ordered to be brought in.—The Smoke Prohibition Bill was read a second time.

Thursday.—Several Railway Bills were advanced, and notices of motions postponed.—The Customs Duties Bill was read a third time, and passed.—Sir R. Peel fixed Thursday, the 7th June, for the Dissenters' Chapels Bill.—Mr. W. O. Stanley submitted a motion for a committee to inquire into the management of the Friar's (Bangor) Free-school, and other endowed free-schools in the diocese of Bangor and St. Asaph's.—Sir J. Graham stated that the Lord Chancellor was prepared to introduce into the other House, within a fortnight, a Bill on the subject, and, moreover, that it was the intention of Her Majesty's Government to press it on in Parliament. It would provide a remedy for the wrongs complained of, having reference to the intentions of the testators, and being cheap and of a judicial character.—The motion was withdrawn.—Mr. Hume brought forward his motion for an address to Her Majesty to give directions that, whenever Her Majesty shall grant the honour of the peerage or baronetcy, or knighthood, or order, for eminent public services, no fees shall be charged thereon.—The Chancellor of the Exchequer objected to the motion, because the Crown had no power in the matter, as the fees received in these cases were sanctioned by law, and could not be taken away without an Act of Parliament.—The motion was negatived without a division.—Mr. Christie was proceeding with his motion respecting the Universities of Oxford and Cambridge when the House was counted out.

Friday.—Admiral Bowles took the oaths and his seat for the borough of Launceston.—The South Eastern Railway Bill and the Sheffield United Gas Bill were read a third time and passed.—Mr. W. F. Mackenzie moved that the committee on the Croydon and Epsom Railway Bill have leave to report on or before the 3d day of June next.—The committees on several other railway Bills were also allowed further time for making their reports.—The third reading of the Southampton Improvement Bill was postponed until the 3d of June.—A great number of petitions in favour of and against the Dissenters' Chapels Bill, and on other subjects, were presented.—Mr. Ferrand presented a petition from an individual named Lundy, residing at Hull, complaining of the hon. Member for Montrose, chairman of the Smuggling Committee, refusing to pay him his expenses in attending as a witness.—Mr. Hume said he certainly was chairman of the committee alluded to, and he ordered 5*l.* to be sent to bring the witness to London; but when he arrived, he refused to answer any questions. If another similar inquiry was to be entered into, he would not wish for such a witness.—Dr. Bowring said, as a member of the committee, he wished to add that a more unimportant witness never attended before a committee. He positively refused to answer any questions.—Mr. Darby said, amidst much laughter, that he thought this was the first time the hon. Member for Montrose had ever "been done."—The petition was then ordered to lie on the table.—Sir G. Clerk brought in the Bank of England Charter Bill, which was read a first time.—The Speaker asked when the second reading was to be moved?—The Chancellor of the Exchequer said he would appoint it for the first day after the Whitsun holidays, and then name a day on which the discussion would take place.—Mr. C. Berkeley inquired by whose authority the gaming-booths at Epsom Races had been put down? Was it by the local magistrates, the Commissioners of the Metropolitan Police, or by the authority of the Home Office?—Sir J. Graham said, it was by his authority that the gaming-booths at Epsom Races were abolished; he had caused gaming-houses in London to be prosecuted, and he thought that gambling stalls at races in the vicinity of the metropolis should be also abolished. The local magistrates had nothing to do with the question. He was quite willing to take the responsibility on himself.—In answer to a question by Mr. M. Milnes, the Earl of Lincoln said that the refusal of the Woods and Forests to allow the Greenwich pensioners to dine in Trafalgar-square to-day, arose from unavoidable circumstances. There was no objection to the proposition, but in the present condition of the works it was deemed advisable to postpone it for the present.—Mr. Labouchere asked whether it was intended, if Manchester paid the expense of the Bill for constituting Manchester an inland town for bonding warehouses, whether it was contemplated to extend similar privileges to other towns? The Chancellor of the Exchequer said, the Government, from the peculiar situation of Manchester, had consented to a Bill for erecting bonded warehouses in that town—the town paying the expenses. It was an experiment, and not intended at present to apply to other towns.—Sir R. Peel moved that the House, at its rising, adjourn until Thursday next, which was agreed to.—Mr. Christie complained that the House should have been counted out the other evening, when he was about to bring forward a motion relating to education in the Universities of Oxford and Cambridge.—Sir R. Peel said it was no fault of his. He was surprised when he returned from taking refreshment to find the House up.—Mr. Christie said he wished to give notice that he should renew his motion on the 13th of June, and if then prevented from calling the attention of the House to the subject, he should most certainly renew it next session.—Sir R. Peel gave notice that on Friday, May 31, he should move the further consideration of the Ecclesiastical Courts Bill. On Monday, the 3d of June, the sugar duties would be brought forward. On Tuesday, the 6th of June, he should move the second reading of the Dissenters' Chapels Bill; and on Friday he should bring the Bill for dividing parishes in Scotland under the consideration of the House.—Mr. Villiers gave notice, that if he should not be able to bring forward his motion for a Repeal of the Corn-laws on Tuesday, the 18th of June, he should do so on the first day possible afterwards, viz., on reading the order for going into Committee of Supply.—In answer to questions by Mr. Hume, Lord Stanley said Sir Charles Metcalfe, the present Governor of Canada, was anxious, as far as possible, to pursue the same line of policy as that adopted by his predecessor (Lord Sydenham), and no time would be lost in the formation of an administration in that country. The House then went into a Committee of Ways and Means. (Left sitting.)

CITY.

Money Market, Friday.—Consols for the account closed at 99⅝. Red. Three per Cents. 98⅞. Three-and-half per Cents. 102⅝. Bank Stock, 191. Exchequer Bills, 72 to 74, premium.

BANKRUPTCY ANNULLED.—W. Read and E. Page, of Ipswich, Suffolk, ship-builders.

GAZETTE OF THE WEEK.—BANKRUPTS.—J. Cooper, Stoney-lane, wheelwright—William Lickfold, late of Marrow, but now of Hazlemere, Surrey, victualler—W. C. Buttress, of Sewardstone, Essex, silk-throwster—James Snelling, 63, Blackman-street, eating-house-keeper—I. Alden, Oxford, butcher—P. R. Morrison, late of Liverpool, but now of Hammersmith, merchant—T. Carline, of Shrewsbury, builder—D. Parker, of Lancashire, hop-merchant—William Gray, of Sheffield, wine-merchant—L. L. Halls, of Taunton, tea-dealer—J. Ward, of West Bromwich, coach-maker—W. Fletcher, of Cinderhill, maltster—E. Riley, of Stratford upon-Avon, grocer—M. Lewis, of Derby, bonnet-manufacturer.—B. Webb, High-street, cheesemonger—J. W. Martin, Newmarket, druggist—J. M. Pike, Great Bath-street, Cold Bath-square, victualler—J. C. Johnson and W. Chapman, Manchester, manufacturing chemists—J. Pitt, Longdon, Worcestershire, innkeeper.

SCOTCH SEQUESTRATIONS.—J. M'Coll, of Glasgow, provision-merchant—A. Wilson, of Edinburgh, cattle-dealer—R. W. Hume, of Leith, sauce-manufacturer—C. M. Bannerman and Co., Glasgow, merchants—R. Park, East Kilbride, Lanarkshire, innkeeper—A. M'Gregor, Glasgow, baker—W. King, Glasgow, victualler.

Metropolis and its Vicinity.

British and Foreign Anti-Slavery Society.—The fifth Annual Meeting of the Anti-Slavery Society was held on Friday in Exeter Hall. Lord Brougham had been announced as the chairman, but on the previous day his Lordship wrote a letter to the committee stating that he could not attend in consequence of the defective constitution of the judicial committee of the Privy Council, which rendered his presence at that committee necessary, to prevent public inconvenience and detriment to parties. Mr. S. Gurney was therefore called upon to preside. Mr. Scoble read the report of the committee, which was of great length. The Bishop of Norwich moved, and the Rev. J. Kennedy of Aberdeen seconded the adoption of the report. Mr. G. Thompson then moved an amendment, for the purpose of preventing the future committee from interfering, through the medium of Government, in favour of the differential duties proposed to be adopted between slave and free-grown produce. Mr. Anstey, of Devizes, seconded the amendment; but after a pledge had been given on the part of the committee that they would revise the laws relating to fiscal regulations, Mr. Thompson consented to withdraw it. Mr. O'Connell, Sir G. Stephen, Mr. Buxton, Mr. Bright, M.P., and other gentlemen then addressed the meeting, and after a somewhat angry discussion, Mr. Thompson said that he had not been fairly treated, and he would therefore again move the amendment. The Chairman then put Mr. Thompson's amendment to the meeting. A show of hands was taken, and the chairman declared the amendment to be carried. This announcement was received with loud cheers. Several resolutions, in connexion with the ordinary business of the Society, were put and carried unanimously. Mr. O'Connell was loudly cheered on his arrival in the room, and during the progress of his speech.

The West India Interests.—On Tuesday, a general meeting of planters, merchants, and others interested in the British West India colonies, took place at Willis's Rooms, "to consider the propriety of petitioning the legislature against any alteration in the duties on sugar, coffee, and cocoa, which should not embrace a reduction of the duties on similar produce from the British possessions." Viscount Combermere presided, and observed that the meeting had been convened in consequence of the determination of Government to make such an alteration of the duties on sugar, &c., as would, unless a strenuous effort were made on the part of the West India proprietary to resist it, involve the whole of them in utter ruin. A variety of representations had been made to her Majesty's ministers upon the subject, but without success, and the only course now open to them was an appeal to the Legislature. The resolutions it was intended to propose, were as mild as under all the circumstances they could be expected to be, and exhibited forcibly the injuries which had been inflicted on the West India body of proprietors since the abolition of slavery. All they now sought for was protection, and they had a right to demand that if the duties on the sugar of foreign colonial produce were to be reduced, that the duties on British colonial sugar should be reduced also. In the course of the discussion on the different resolutions, the Earl of Harewood said, that he possessed an estate in Jamaica, upon which his grandfather had expended from 11,000*l.* to 12,000*l.* in hard cash, and which had generally yielded no return. Indeed, since slavery had been abolished, he had felt it necessary to lay the land in fallow, and give up entirely the cultivation of the estate. Prior to the abolition of slavery there were 400 slaves on that estate, but now there was not a quarter of that number of labourers.—Sir E. Hyde East contended that if the project of ministers were carried, it would not only destroy the West India colonies, but tend greatly to depreciate our commercial and state navy.—Lord Saltoun said that he could not shut his eyes to the fact that great injury would result to the British colonies if the proposition of the Government were carried out. It was not only the West India proprietary body that had to be looked to; they must bear in mind the vast amount of money wholly arising from West India property, upon which widows and fatherless children were solely dependent.—Mr. Carington repudiated the idea that the colonies themselves had established slavery, and declared that, although his property by its abolition had dwindled from thousands to hundreds, he would sooner that it dwindled to nothing than return to that most inhuman and debasing system. If the present Government were determined to carry out certain dogmas of political economy, such as cheap sugar, &c., for the mere sake of popularity here, they had no right to do so at the expense of the British colonists.—Mr. Mackinnon, M.P., said that the British Government had given the colonists 17 millions by way of compensation, when it was proved, in 1832, that the value of their property was 140 millions, therefore to say the former sum was compensation was absurd. He contended that the ministry had no right to earn popularity at home by taking money out of the pockets of the West India colonists. The duty and freight of sugar of West India produce did not amount to less than 33*s.* per cwt., and add to that 27*s.* for the cost of production, it amounted to nearly 60*s.* Now, we could purchase Manilla sugar for 17*s.* per cwt. in bond, and adding a duty of 34*s.*, made 51*s.* — thus underselling the West India proprietor by 8*s.* or 9*s.* per cwt. in the market. If the Government were really desirous of giving the public cheap sugar, why did they not reduce the duty on West India grown sugar to 20*s.*, and keep foreign sugar at 34*s.*—Sir Alex. Grant adverted to the loss the planters had suffered from the term of apprenticeship having been abridged. Abolition of slavery reduced the annual importation from the West India islands and British Guyana from between 4,000,000 and 5,000,000 cwt. of sugar annually, to 3,520,676 cwt.; and in 1841, when the apprenticeship was abolished, the importation fell to 2,148,218 cwt. The loss upon this, including the 8 out of the 12 years, apprenticeship, which the colonists had lost, amounted to upwards of 14,000,000*l.* sterling. He therefore denounced the present attempt still further to take money out of their pockets. Lord St. Vincent, Lord Reay, Sir W. Codrington, Sir A. Leith Hay, Sir R. Dallas, Mr. Stewart, M.P., Sir J. R. Reid, Mr. P. M. Stewart, M.P., Mr. J. A. Smith, M.P., and other gentlemen addressed the meeting, and the resolutions, 15 in number, were agreed to, as was also a petition to the legislature founded on them.

East India Company.—On Wednesday evening, the East India Directors entertained at dinner in the London Tavern, Sir H. Hardinge, the new Governor General of India, the Cabinet Ministers, and about 150 noblemen and gentlemen connected with Government, or with India. Mr. Sheppard, chairman of the Directors, presided, and after the usual loyal toasts, proposed the health of Sir H. Hardinge, stating that, without any previous communication between them, Her Majesty's Ministers and the Court of Directors named him for that purpose without any concert or communication—his name having simultaneously occurred to Her Majesty's Ministers and the Court of Directors as the fittest person for that office. Sir H. Hardinge, in returning thanks, observed that, let the achievements of the Indian army be ever so brilliant—let their successes be ever so dazzling—he trusted that their triumphs would always be directed towards obtaining and securing that which was the legitimate consequence of war, a lasting, a long, and a durable peace—a peace calculated to confer advantage on the country, to ameliorate the condition of the people, to improve their education, to give them all the advantages that were calculated to secure the happiness and prosperity of the country. To those objects he should be always desirous to turn his attention; he hoped that a peace, which would be beneficial to the country, would be the successor of war; and great as was the distance between this country and India, if there was any consideration which more than another could induce him to apply to his duties with diligence and ardour, it was the hope that by securing those advantages to India he might be able to lay the foundation for the lasting peace and happiness and prosperity of the people of India. The Duke of Wellington returned thanks for the Army, and Sir R. Peel for her Majesty's Ministers. Both expressed their cordial approbation of the Court of Directors in their selection

of the new Governor-General, and congratulated the people of India on the appointment of an officer so well qualified to secure their peace and prosperity, and consolidate the resources of the country. The Duke of Buccleuch proposed the "Court of Directors." The Chairman in reply said that the Court of Directors valued highly such an expression of opinion, and although India claimed the first consideration of the Court of Directors, they did not forget this country, for they were thoroughly convinced that the interests of both countries were so closely united, it was impossible to separate them. The system pursued in India by the East India Company had hitherto stood the test of experience, and it would continue to be a system having for its object the advantage of the people of India. He hoped they would continue to discharge their duties faithfully, and to receive the confidence which had so long been, and still continued to be, placed in them.—In connection with this dinner we may here state that the new Governor-General and suite will proceed through France to Marseilles, where a government steamer will be in waiting to convey them direct to Egypt. They will then embark, at Suez, on board the steam-ship Hindostan, for Calcutta, and will arrive there about the 20th of July. Sir H. Hardinge will be the first Governor-General who has proceeded to his government by the overland route. It is a question whether Lord Ellenborough will have had time to make arrangements for his return before his successor's arrival, which will take place only a few days after Lord Ellenborough receives his recall. It is calculated that Sir Henry will have entered upon his functions in India within little more than a couple of months from the date of his appointment being made in Leadenhall-street—a celerity of movement which the history of Indian affairs has never yet been able to record. Lord Ellenborough, it is expected, will leave Calcutta by the Bentinck for Suez, about the 15th July, and will probably arrive in England about the end of August.

Anti-Corn-law League.—The weekly meeting of the League took place on Wednesday evening in Covent-Garden Theatre. General Briggs presided, and the meeting was addressed by Mr. Green, a Dissenting Minister, Mr. Richard Taylor, Mr. G. Thompson, and Mr. W. J. Fox.

The Nelson Dinner to the Greenwich Pensioners.—A delay has taken place in arranging the dinner which was to have been given to the Greenwich Pensioners yesterday, in Trafalgar-sq., in consequence of the Committee not having been able to obtain the sanction of the Commissioners of the Woods and Forests; the ground of the objection being, as stated in a letter sent by the Earl of Lincoln, on the 16th inst., to the Committee, "the defective condition of a portion of the pavement in the area of the square, and the repairs thereof in progress." Since the receipt of the letter, the Committee have been endeavouring to induce his Lordship to recall his refusal, but without success, and they have accordingly announced that the dinner is again postponed.

The Nelson Column.—At a meeting of the committee on Thursday, it was stated that the public subscription had amounted to 20,000*l.*, all of which had been expended, and that between 10,000*l.* and 12,000*l.* were still wanting to complete this national memorial. Under the circumstances, the committee resolved to wait upon Sir Robert Peel, to represent the exact state of the case, and to request the Minister's aid in accomplishing that which could not be effected by public subscription.

Art-Unions.—A special meeting of the Printsellers' Association of London was held on Wednesday, Mr. Wagstaffe in the chair, to take into consideration the issue of prints and other important business connected with art-unions. A petition to Parliament against the system of publishing engravings by art-unions in particular, and against art-unions in general, on the ground of their injury to art, was unanimously agreed to. It was also resolved to call a general meeting of engravers for the purpose of adopting similar measures, and that Mr. Emerson Tennent, M.P., be requested to preside.

St. Paul's.—On Saturday the following notice was placed at the doors of the cathedral, that "From and after this day (Saturday, the 18th) divine service will be discontinued, Sundays excepted, until further notice."

The Recent Gales.—Since Saturday last the weather has been more like that generally prevailing in March and November than at the latter end of May. The effects of the north-easterly gales have been most severely felt. Several wrecks of small craft are reported from different parts of the coast.

Welsh Church.—The Bishop of St. David's preached on Sunday morning a sermon in the Welsh language at the Welsh Metropolitan Church, Ely-place. His Lordship, it is said, was most happy and expressive in his composition and delivery, and that his congregation seemed electrified, it being probably the first time that a Bishop had ever preached in Welsh in London, and that Bishop, too, an Englishman. It is evidence, however, of what a sense of duty may accomplish.

Metropolitan and City Police.—Some voluminous returns respecting the expenses, &c., of the metropolitan and city police have been published by Parliament. The balance-sheet of the accounts shows that the total amount received for the purposes of the metropolitan police, made up to the 31st December, 1843, was 309,623*l.* Of the above amount 23,529*l.* was received from the consolidated fund through the Treasury, and 14,397*l.* from theatres, fairs, races, and various other public places. The total amount of expenditure during the same period was 288,957*l.* Thus the balance or surplus of income over expenditure would appear to be about 20,600*l.* in round numbers. The total number of men of all ranks and classes of the Metropolitan Police serving on the 1st January, 1844, amounted altogether to 4673, at salaries varying from 600*l.* to 44*l.* per annum. In 1843 the number of robberies committed in the various districts of the Metropolitan Police amounted to 12,683, the value of the property stolen to 28,284*l.*, and the value of the property recovered 5419*l.* The total number of persons taken into custody by the City Police alone was, in 1840, 12,457; in 1841, 9200; in 1842, 8758; and in 1843, 10,574.

Accidents.—On Sunday evening a wherry, pulled by a waterman's apprentice, and containing 12 young boys and one girl, was sunk by the carelessness of the waterman, by running against a steamer moored off London-bridge. The whole party were thrown into the river, the tide running very strong; and it is supposed that six of the children were drowned; but as all the bodies missing have not been found, the exact number is not known. The Jury at the inquest returned a verdict of Accidental Death.—Numerous accidents are reported to parties returning from Epsom Races. Among these, two gentlemen, named Beaumont and Cox, from Hull, were thrown out of their gig and severely injured; the former so seriously, that there is little hope of his recovery. Mr. Punchard, the landlord of the White Hart, in the Strand, and Mr. Ing, landlord of the Essex Head, in the Strand, were also severely injured by the upsetting of a coach on its return to town, after the Derby, on Wednesday.

Mortality of the Metropolis.—The following is the number of Deaths registered in the week ending Saturday, May 11.—West Districts, 117; Northern, 154; Central, 151; Eastern, 178; Southern, 212; Total, 812. Weekly average for the last five years, 946.

Provincial News.

Fires.—We regret to state that the local papers contain long accounts of incendiary fires in different parts of the country, and particularly in Essex and Suffolk. Among those in the latter counties we may mention the following:—On the 10th inst. a straw stack on the premises of Mr. J. Baldry, at Lidgate; the flames broke out at mid-day, and it is supposed that the stack was ignited by some chemical preparation placed in the stack on the previous night. On the 13th, a barn on the farm of Mr. T. Brackenbury, of Shouldham Thorpe, was destroyed. On the 14th, the granary, barns, stables, and other outbuildings, filled with corn, on the farm of Mrs. Jonas, of Great Thurlow, were destroyed. On the same day, the outbuildings, full of corn, on the farm of Mrs. Clayden, at Withersfield, were destroyed. Other fires occurred at Snarehill, near Thetford, on the premises of Mr. J. C. Partridge, a county magistrate, which destroyed a rye-stack; on the premises of Mr. Day, of Garboldisham, which destroyed a haulm-stack; and at Mr. Emerson's farm, near Bradfield (the second on the same premises within a year), which was fortunately got under without serious damage. At Braintree, on Thursday, on the farm of Mr. Humphrey, occupied by the Rev. Alex. Fletcher, of Finsbury Chapel, the barns and outhouses, with two stacks of hay, were destroyed. On the same evening, a large bean-stack was fired on the premises of Mr. Gardner, of Tollesbury, about a mile and a half from Tolleshunt D'Arcy, where an incendiary fire occurred upon the farming premises of Mr. Seabrook a few evenings previously. On Thursday, a rye-stack, on the estate of H. C. Partridge, Esq., Snarehill, was entirely destroyed. On the 12th, two wheat-hovels, and part of a hay-rick, in the rick-yard of Mr. Winckles, of Field Burcote, in the parish of Green Norton, Northamptonshire, were destroyed, together with a barn filled with wheat, and a stable containing a quantity of barley. In Dorset, at Seavington, near Lyme Regis, a few days after the late fire at the latter place, three dwelling-houses, a barn, and other buildings, were destroyed. At Sherborne, on Thursday, the court-house, farm-house, and buildings attached, in the occupation of Mr. Thornford, were destroyed. Destructive fires occurred also about the same time in the town of Trowbridge, and in the villages of Winfreth, Stoke St. Mary, Rodford, Longfleet, and Woodford, in the same county. On Monday week the ricks and barns in the extensive homestead of Mr. Taylor, at Enbrook Farm, midway between Folkestone and Cheriton, on the line of the Dover Railway, were destroyed. It is supposed that the accident originated from a spark blown from the locomotive engine of the down train. It is said that the stoker was attending to the fire as the engine passed over the embankment, and that a large number of red-hot cinders fell from the fire near the spot. On Saturday morning, a fire broke out in the farm-yard of Mr. Tattersall, near Willesden. Two large stacks of hay were, to a great extent, destroyed, and the total loss is estimated at nearly 400*l.* The fire is stated to have been the result of carelessness on the part of a boy engaged about the farm.

Bath.—The funeral of Mr. Beckford, the author of "Vathek," took place in this city on Saturday last, with unusual pomp. The streets throughout the line of route were thronged with spectators. The body, which had previously been embalmed, was deposited in a granite sarcophagus above ground, which will form an imposing ornament of the City Cemetery. The funeral was attended by the Duke and Duchess of Hamilton, the Marquess of Douglas, the Countess of Lincoln, the Marquess of Huntley, the Earl of Dunmore, Hon. C. A. Murray, Mr. Stewart Mackenzie, and a long train of private friends.

Bradford.—Another fatal accident has happened in this town, in consequence of the bursting of a boiler. It took place in Sharpe's Mill, occupied by Messrs. Greenwood, Messrs. Ackroyd, and Mrs. Sharp, who had agreed to work on alternate days while another boiler on the premises was repairing. They disagreed, however, and were all working on the same engine, which was unequal to the duty, and exploded. Two persons were killed and others severely scalded, and the jury, after laying a deodand of 100*l.* on the engine, censured Messrs. Greenwood and Messrs. Ackroyd for their conduct in putting on more power than the boiler in its unsafe condition was calculated to carry, and regretted that they could not reach them by a fine. They therefore requested that they should be called in to receive the censure through the coroner in the presence of the jurors.

Carlisle.—On Saturday the 18th inst., Naworth Castle, the baronial seat of the Earls of Carlisle, situated about 12 miles from this city, was destroyed by fire. There was a very scanty supply of water, for although there was a tank of considerable size over the keep, and some springs were within the walls, they were insufficient to produce any perceptible effect upon the conflagration. A small stream, also, that runs close under the castle, was dammed up; but there was barely enough water to keep a single engine going, and in spite of every effort that could be made, the fire speedily involved the whole building, the dryness of the old woodwork, &c., rendering it as inflammable as touchwood. By eight o'clock the castle was burnt down, with the exception of the steward's residence on the western, and a portion of Belted Willie's Tower on the eastern side of the quadrangle. The amount of property saved is more than might have been expected, but the damage done is altogether irreparable. The family papers and muniments were rescued, and some unimportant parts of the furniture are preserved, but from its extreme antiquity, the greater part of it could not bear removal; and what the fire spared has been hopelessly damaged. Much of the beautiful armour and magnificent tapestry, described by Sir Walter Scott, has been consumed, and the stately halls are utterly destroyed. The regret and consternation which this disastrous fire has spread through the country, cannot be described. Naworth had long been an object of local pride, and of great interest to all visitors to the district. It was, in fact, one of the most important of the "sights" in Cumberland, and was in many respects *unique;* and being open to the public on all suitable occasions, it afforded the only opportunity in existence of seeing how the Border Barons lived in the olden time. The fire is supposed to have originated in the porter's lodge, in consequence of the flues being out of order, or too much intersected with wood; and although there was at first an impression that it was the act of an incendiary, this is certainly not the impression now. The castle is said to have been insured to the amount of 10,000*l.*, and it is gratifying to add, that there was neither life nor limb endangered by the fire, although there were thousands present.

Guernsey.—In consequence of recent disputes between the Royal Court and inhabitants of Guernsey and the Governor of the island, Major-General Napier, a deputation has been sent to London to lay the complaints of the inhabitants before the Government. After some discussion on the power of the Home Secretary of State to interfere in the affairs of the island, it has been decided that the Privy Council is the proper tribunal to entertain the complaints, and that the whole affair will be judicially heard and decided by the General Committee of Council, assisted by three of the law Lords, towards the end of the next month, or the beginning of July, till which time, consequently, the affair will remain in abeyance. In reference to this subject it is stated that a Queen's messenger was sent down on Saturday to the Isle of Wight, with orders for some troops to be sent with all expedition to Guernsey; 350 of those in Parkhurst barracks were to embark on Monday.

Ipswich.—The local papers state that Sir J. Rowley has received a communication from Col. Dear, of the 21st Fusiliers, stating that a man of that regiment, named William Towns, a native of Polstead, has confessed that he was the murderer of Byam Green, the gamekeeper of Miss Lloyd, at Hintlesham Hall. It appears that the murder was committed nine years ago, and that a man named Chalker of this town was convicted on circumstantial evidence and hung for the crime. The soldier now confesses that this man was innocent, that he attended his execution, and that he had been so wretched since that time that death in any shape would now be welcome to him.

Lincoln.—An occurrence has lately taken place at Westlaby, near this city, which has excited a great sensation in that locality. Some persons who were taking young rooks in Mr. Tongue's rookery, found a bundle which contained a dead child. The affair caused a good deal of conversation, and was mentioned to Ann Robinson, Mr. Tongue's housekeeper, who was observed to evince considerable confusion, though at the moment she passed it off with an expression of surprise. In the course of the night she destroyed herself by taking laudanum. The child was hers; but nothing transpired tending to show whether it had been put to death, or died in the birth through neglect. Inquests were held on both bodies. In the case of the woman a verdict of *felo de se* was returned, and in that of the child the Jury returned a verdict of "Wilful murder" against the mother.

Neath.—On the 14th inst., a jury was impanelled in this town, to assess the amount of damages to be paid by Mr. Rowland Fothergill, the owner of Hensal Castle, for a serious injury inflicted on Mr. Brown, the superintendent of his farms, with a pitchfork, on the 17th

August last. The damages were laid at 1000*l.* It appeared from the evidence, that Mr. Fothergill taking offence at an expression of Mr. Brown's, in a hayfield on the estate, struck the latter with a pike, which broke in two pieces, and inflicted such serious injuries on Mr. Brown, that he remained under medical treatment for nearly five months, and still labours under injured vision and partial deafness, from which two medical gentlemen gave it as their opinion that he would never recover. A number of witnesses described the occurrence in the hayfield, the sufferings of the plantiff, and the injuries under which he continued to labour from the effects of the blow. No witnesses were called for defendant.; and the jury awarded the plantiff 500*l.* damages. The greatest interest was manifested in Swansea, Merthyr, and Cardiff as to the result, Mr. Fothergill being one of the principal iron-masters, and a magistrate of the county.

Nottingham.—The *Nottingham Review* of yesterday, states that when on the point of going to press, they had ascertained that the police have discovered the bodies of a woman and three children, in a plantation, near Colwick, with their throats cut. They are identified as the wife and children of one William Saville, of this town, who was seen taking a walk with them in that direction, on Tuesday morning last. The man is apprehended.

Oxford.—The Tractarian party are greatly excited by the refusal of the Vice-Chancellor to allow Mr. Macmullen's degree. Mr. Knollis, Fellow and Dean of Magdalen College, has addressed a letter to the Margaret Professor of Divinity (Dr. Faussett), calling on him to bring before a board of heresy the sermon of Professor Garbett, preached at St. Mary's, on Sunday week; and a similar letter has been addressed to the Vice-Chancellor by the Rev. C. Marriott, of Oriel, one of the leading followers of Mr. Newman. It is also announced that the Tractarians will oppose the new statute for establishing the proposed college of modern languages, on the ground that the teachers are not called on by the new statute to sign any test of religious doctrine, so that continental Protestants, Presbyterians, and others, may be admitted. At a meeting of the Hebdomadal Board on Monday, a resolution passed unanimously, commissioning the Vice-Chancellor to enjoin upon the Regius Professor of Divinity a return to the statutable form of divinity exercises. This resolution involves the overthrow of the whole practice of divinity exercises as at present existing, and upon which the Regius Professor has based his claims of setting the theses, and testing the candidates' orthodoxy; and it is the very point which Mr. Macmullen has been trying to obtain by litigation during the last two years.

Penrith.—On Wednesday, the 15th inst., the estates belonging to the Duke of Devonshire, in this parish, were offered for sale, at Newcastle-upon-Tyne, in 41 lots. The ruins of Penrith Castle, the farm-house, and about five acres of the Castle-farm, called the Castle Garth, comprised one of the lots. The competition for this lot was very smart between the steward to the Earl of Lonsdale and Mr. Bleaymire. It was declared a sale at 1300*l.*, and was ultimately struck off to Mr. Bleaymire at the price of 2000*l.* It is understood that this lot was purchased for the directors of the Carlisle and Lancaster Railway Company. His Grace's hotel, buildings, and shambles adjoining, comprised another lot, which was offered at 4000*l.*, but there being no bidders, it was bought in at a reserved price. The greater part of the other lots were town-fields scattered over the parish, many of which the projected line of railway runs through. Some of these lots were sold at the rate of about 265*l.* per acre; the greater part of the remaining lots was bought in.

Windsor.—It has been announced in the daily papers that the appointment of Master of the Royal buckhounds, filled by the Earl of Rosslyn, has been abolished by her Majesty, and that the whole establishment over which his Lordship presided is to be immediately discontinued. It appears however that the announcement is premature, no official intimation of the discontinuance of the Royal hunting establishment having at present been received.

Railways.—The following are the returns for the past week:—Birmingham and Derby, 1321*l.*; Birmingham and Gloucester, 2147*l.*; Eastern Counties, 4371*l.*; Edinburgh and Glasgow, 2112*l.*; Great Western, 15,964*l.*; Grand Junction, 7534*l.*; Glasgow, Paisley, and Ayr, 2064*l.*; Great North of England, 1315*l.*; London and Birmingham, 16,904*l.*; South-Western, 6242*l.*; Blackwall, 1044*l.*; Greenwich, 850*l.*; Brighton, 3520*l.*; Croydon, 458*l.*; Liverpool and Manchester, 4645*l.*; Manchester, Leeds, and Hull, associated, 5766*l.*; Midland Counties, 2582*l.*; Manchester and Birmingham, 3144*l.*; North Midland, 4359*l.*; Newcastle and Carlisle, 1383*l.*; South-Eastern and Dover, 3931*l.*; Sheffield and Manchester, 612*l.*; York and North Midland, 1491*l.*—A special meeting of the Great Western Railway Company was held on Tuesday, for the purpose of taking the opinion of the proprietors on the Bill now before Parliament, for enabling this company to unite with the South Devon Company, and subscribe 150,000*l.* towards that undertaking. The report stated that the consent of three-fifths of the company at a special meeting was necessary before the Bill could be read in the House of Lords. A resolution was then passed unanimously, approving of the Bill, and it was announced that on the 10th inst. the Royal assent was given to the Bill for enabling the company to amalgamate with the Oxford and Cheltenham Companies, whereby they would be all under one management, and the lines would be completed at less cost. It was also stated on the authority of Mr. Brunel, that the railway from Oxford to Didcot will be opened, as originally intended, on Monday, the 10th of June; thus bringing the University within a drive of two hours and a half from the metropolis.—A meeting of the Great Leinster and Munster Company was held in London on Monday, at which it was announced that the Cashel Company had agreed to give up to the Leinster and Munster Company the branch to Athy and Carlow, from the main trunk near Kildare, with a view to the construction of the line to Kilkenny, as originally projected by the Company. It was then unanimously resolved that in consequence of the favourable disposition evinced by the Cashel Company, the present committee be requested to negotiate with the provisional committee, with a view to make the requisite arrangements for having the branch to Athy and Carlow transferred to the proposed South Eastern Company, and that a special meeting be shortly held to take the whole subject into consideration.—The Essex papers mention as a proof of the economy and expedition of railway travelling, that a legal gentleman of Colchester left that town, after a very early breakfast, on Wednesday morning, by the mail train for Warwick, which he reached by 11 o'clock, and went on to Leamington to complete his business, where he had 20 minutes' interview with his client. He then returned to London *viâ* Coventry, reached town by 6 P.M., dined, and kept three appointments during a stay of two hours and a half, returning to Colchester by the mail train to a late tea at 11 o'clock, after which he finished the labours of the day by communicating, through the same night's up-mail, to his friends at Leamington, Warwick, and London, his safe arrival and the result of his journey. The distance thus travelled in 20 hours, besides the walking in London, was as follows:—From his house in Colchester to London, 52 miles; Shoreditch to Euston-square, 4; to Coventry, 94; to Warwick (posting), ten; to Leamington, 2; to Coventry, 10; to London, 94; to Shoreditch, 4; to Colchester, 52; total, 322.—On Thursday, a committee of the House of Commons (Lord Howick in the chair) decided upon granting the Croydon Company's branch railway to Epsom, and on rejecting that of the rival company, the South Western. The characteristic of this protracted contest is, that the Croydon Company propose to lay down a line from Epsom to London (a length of twenty-one miles) on the atmospheric system. Mr. W. Cubitt, Mr. Brunel, Mr. Samuda, Mr. B. Gibbons, and other engineers were examined for the atmospheric plan, and Mr. R. Stephenson against it. The subject has excited much interest in the scientific world; and the committee-room has been crowded daily.—The opening of the West London Railway, which has been so long in bringing to completion, is at length announced to take place on the 27th inst. (Whit Monday). This line is intended as a communication for passengers and luggage between the Great Western and the London and Birmingham Railways, and the south and south-western portions of the metropolis and its suburbs, as well as for the transit of heavy goods from the above principal railways and the Thames, by means of the Kensington canal. It commences at the basin of the Kensington Canal, south of the Great Western-road, under which it passes at the western extremity of Kensington, and proceeds in a northerly direction under the Uxbridge-road at Shepherd's-bush, and crossing Wormwood Scrubs, passes across the Great Western Railway at Kensal-green, and from thence passing under the Paddington Canal, joins the London and Birmingham Railway. On the north side of the Great Western-road, and also on the north side of the Uxbridge-road, two stations have been erected, with convenient waiting-rooms for passengers, from which it is intended to run trains every day, after Monday next, to meet corresponding trains on the Great Western and London and Birmingham Railways.—A select committee of the House of Commons have been engaged for nearly a month in an investigation into the respective merits of the two competing lines projected by the South-Eastern and the Brighton Railway Companies, the former designated the Hastings, Rye, and Tenterden Railway; and the latter the Brighton, Lewes, and Hastings Railway. Monday and Tuesday were consumed in replies by Mr. Talbot on the part of the Brighton line, and Mr. Austen for the South-Eastern; and on Wednesday the committee decided that the preamble of the Hastings, Rye, and Tenterden Railway Bill is *not proved*, and that the preamble of the Brighton, Lewes, and Hastings line *is proved*. Large sums have been expended in the inquiry.—The infancy of the great project of the London and York Railway is not without the trials incident to such undertakings. After elongating its original route, then altering its original route, then coalescing with a "monster" rival, it has finished by changing its engineers. Messrs. Walker and Burgess have, in fact, resigned, on the ground that the "matter has now assumed such a magnitude and character that it would occupy too much of their time."

IRELAND.

THE STATE TRIALS.—The Court of Queen's Bench opened for Trinity Term on Wednesday, and a great number of persons had assembled in the expectation that judgment would be given. The Judges, however, did not enter Court until the unusually late hour of twenty minutes past four o'clock, having been for several hours previously shut up in chamber in consultation, and Mr. Justice Burton alone having attended for the purpose of swearing in the Grand Jury. The Chief Justice said, immediately after taking his seat, "Mr. Attorney-General, I have to state to you that the Court has appointed Friday morning for giving judgment in the case of the Queen *v.* O'Connell and others.t' No more was said on the matter, and the Court adjourned. The Court had been crowded during the day.

Dublin.—The usual weekly meeting of the Repeal Association took place on Monday, in Conciliation-hall. There were very few persons in attendance. Mr. W. Gernon, Barrister-at-law, acted as chairman. Mr. J. O'Connell, M.P., announced the receipt of the following sums from America:—Wisconsin, 12*l.*; Watertown, 22*l.*; Hamilton Gore district, West Canada, 25*l.*; Buffalo, New York, 20*l.*; Halifax, Nova Scotia, 30*l.*; Providence, Rhode Island, 36*l.*; Fawn-river, Massachusetts, 31*l.*; and Philadelphia, 200*l.* The last-mentioned sum was inclosed in a letter from Mr. Robert Tyler, son of the President of the United States. Mr. J. O'Connell, in moving the thanks of the Association to the writer of this letter, said, that he had but one difficulty in doing so, which arose from the fact of his being the son of the man who had set his name to a document authorising the annexation to the Union of the slaveholding district of Texas. There was one sentence in Mr. Tyler's letter, however, which showed that it was impossible he could approve of the acts of these Texans. It was to the effect that all men were capable of self-government, and as that sentence redeemed the writer from the imputation of sanctioning slavery, he felt much pleasure in moving the thanks of the Association to him. Mr. Steele seconded the motion, which was unanimously adopted.—Mr. Doheny, barrister, now entered upon the subject of the "spy system," and charged the Government so broadly with directly encouraging and maintaining this system, as to elicit the interference of Mr. J. O'Connell, who protested in the name of the Association against such language as Mr. Doheny was indulging in. Mr. Doheny said that he was aware the Government repudiated that instrumentality, but still he maintained that there certainly was some principle in existence which induced spies to suppose that they would meet with promotion and rewards, if they made themselves useful in getting men convicted of crime. He then went largely into the subject, and concluded by moving a resolution, which, being seconded by Mr. Cangly, another barrister, was put and carried.—Mr. Steele moved the warmest thanks of the Association to Mr. Doheny for his admirable speech. They remembered what Castlereagh, and what former Governments had done by means of spies and hired agents, and it was therefore most important to O'Connell's peaceable system of reformation that such a system should be exposed and denounced.—Mr. Clements, barrister, seconded Mr. Steele's proposal, which was put and carried.—Mr. O'Neil Daunt now rose to move the resolution relative to Mr. Hume's attack on the Lord Lieutenant of Ireland, of which he had given notice at their last meeting. It was, he said, a colossal falsehood to say that the Irish people were tired of the Vice-regal Government; there never was a greater lie. But it was common to put forward such a protest when the secret object was plunder, robbery, and spoliation. What would be the effect of depriving Ireland of the Lord Lieutenancy? Why, to deprive her of an expenditure of one hundred thousand pounds a year at the least. But in the first instance, Mr. Hume said this was in the spirit of the Union—yes, and so it was—robbery was the true spirit of the Union. The total rent received during the week, including 376*l.* from America, was stated to be 600*l.*—The Dublin Protestant Operative Association have passed a resolution, in which they declare that "they consider Mr. Hume's proposition for the abolition of our local Government, and for the further progress of the modern system of centralisation, as highly objectionable, and calculated to produce effects exceedingly detrimental to the interests of Ireland."—Mr. Coneys, engineer of the Board of Works, has been directed to take up the Tralee Ship Canal from the contractor, who left it unfinished, and to proceed forthwith to complete the work.—The extra guards which for some time have been placed throughout the garrison of Dublin, are discontinued, and the troops on duty are now reduced to the ordinary standard.—A forged draft for 450*l.* was presented to the Bank of Ireland on Friday last, and paid; but some suspicion having been excited during the day, an inquiry was set on foot, and the fraud traced to one of the porters, who has since been arrested at Athlone. An accomplice, who has confessed the facts, is also in custody. It appears that the cheque filled up for the 450*l.* was originally a blank one, which had been dropped in the Bank, and was found by one of the porters implicated.—A rumour has been current for some time that Mr. O'Connell, who has been some years a widower, is about to marry the sister of a lay Fellow of Trinity College. The report has been contradicted, but it is again revived, with some additional particulars. It is said that about four years ago, when Mr. O'Connell visited the north, he was very hospitably entertained by the young lady's father, who likewise presided at one of his meetings in Belfast. This was the first time that Mr. O'Connell saw the lady, who had just then returned from school.—Accounts from Bantry Bay state that the bay has been the scene of great excitement, in consequence of a shoal of whales having entered the harbour. An immense number were secured, the value of which is computed at 1500*l.*

Carrickfergus.—On Wednesday the 15th, the sentence of the law was carried into execution in this town, in the case of John Cordery, who was found guilty, at the last assizes, of the murder of Sergeant Dodd. The unfortunate man died extremely penitent, and attributed the crime to the influence of drink. Great interest was made to save his life, but the Lord-Lieutenant having duly weighed all the circumstances, would not permit the course of the law to be interrupted.

Nenagh.—On Saturday, James Hickey, convicted of the murder of a man named Hanly, at Green-hall, and John Cooke, for the murder of Nowlan, near Roscrea, underwent the last sentence of the law in Nenagh gaol. Hickey denied his guilt to the last; the other, John Cooke, confessed his crime. They were both attended by Roman Catholic priests. A powerful force of military and police supported the civil authorities on the occasion.

SCOTLAND.

Edinburgh.—The General Assemblies of the Kirk and "Free" Kirk of Scotland met on Thursday, the 16th; the first attended by the Marquess of Bute as her Majesty's Lord High Commissioner. The Royal speech stated that her Majesty relies upon the loyalty of the Kirk, promises it her undiminished protection, and strongly inculcates the doctrine of prudence in the deliberations of the Assembly. The Rev. Dr. Lee, Principal of the University of Edinburgh, was elected Moderator, on the motion of Dr. Macfarlane, of Glasgow. The "Free" Kirk, in place of a Royal speech, had a short debate among its own members on the propriety of admitting *ex officio* members, there being both in the Kirk and "Free" Kirk the Theological Professors in Universities. The Rev. Henry Gray, late of St. Mary's parish, Edinburgh, was chosen Moderator. — The General Assembly met again on Friday, but its proceedings were of no interest to the English reader. The Assembly of the Free Church also met, and from the report of its proceedings we take the following account of its funds: Dr. Makellar, chairman of the Board of Missions and Education, made a verbal report respecting the contributions which had been received during the year on behalf of the schemes of the Church, and at the same time laid on the table a printed statement of the total sums subscribed for the several schemes. The following is the result: — Education, 4942*l.* 19*s.* 2*d.*; India, 13,432*l.* 18*s.* 8½*d.*; Home Mission, 2987*l.* 2*s.* 7½*d.*; Colonies, 3619*l.* 1*s.* 7½*d.*; Jews, 4548*l.* 18*s.* 6*d.*; Sutherland, 2259*l.* 12*s.* 7½*d.*—Total, 31,790*l.* 13*s.* 3*d.* The rev. doctor explained that, since the report had been prepared, several subscriptions had been received, which brought the sum total to upwards of 32,000*l.*

Glasgow.—A fatal accident took place in Largs Bay on Friday last. Two midshipmen of the Shearwater surveying steamer, stationed opposite Largs, had been amusing themselves in a small open boat, when it came on to blow from the north-east, and, as they had neglected to slacken sail, the little craft was run under water, while she was rounding the north end of the Larger Cumbrae, and went down head foremost. The accident was observed from the deck of the Vulcan, another Government steamer, which was lying in the bay with her steam up, and she immediately proceeded to the spot, but nothing was found floating except the two caps of the deceased. The gentlemen who have thus untimely met their fate were between 18 and 20 years of age, and one of them was the son of Mr. Cayley, M. P. for the North Riding, who had greatly distinguished himself in the Rodney on the coast of Syria.

Theatricals.

The Prize Comedy.—The committee appointed by Mr. Webster, the lessee of the Haymarket, to award the prize of 500*l.* for the best prose comedy, illustrative of modern British manners and customs, concluded their labours on Saturday, their twentieth meeting, by unanimously adopting the piece entitled "*Quid pro Quo, or the Day of Dupes.*" The title implies a lively and bustling affair rather than a comedy of the romantic or philosophic school, and it is said to be one well adapted to the company at the Haymarket. The author of this production is said to be a lady who is by no means unknown to literary fame.

Miscellaneous.

The Abyssinian Travellers.—At the sitting of the French Academy of Sciences, on the 6th inst., an interesting communication was received from M. Lefebvre, the companion of Dr. Petit, who was devoured by a crocodile whilst crossing the Nile, to the west of Abyssinia. This commission was composed of Drs. Petit and Quartier-Dillon, who were charged with the department of natural history, M. Vignaud as draftsman, and M. Lefebvre for geography. These four young men left Marseilles at the end of 1838, and M. Lefebvre alone has returned to his native country, after witnessing the death, one by one, of his companions. This gentleman, after giving an account of his journey through Egypt and Arabia, and subsequently across the vast plateau of Abyssinia, every part of which he explored, brings his own valuable geographical notes, enriched with important observations in meteorology, magnetic influence, &c., and the collections in natural history formed by Drs. Petit and Quartier-Dillon, with their manuscript details, and the atlas drawn by M. Vignaud. To these important results he has added much valuable information on the commerce and navigation of the Red Sea, and the religion, morals, habits, &c., of the tribes of Africa, and a vocabulary of their language. In M. Lefebvre's paper, which is drawn up with equal good taste and good feeling, he requests the Academy of Sciences to do honour by some public record to the memory of his unfortunate colleagues, and there is no doubt that his wish will be complied with, for what honour can be withheld from men who, in the flower of youth, and from the love of science, and the desire to be useful to their country, sacrificed to them all considerations of comfort, and exposed themselves to the almost certainty of destruction by climate or accident? Speaking of the death of Dr. Petit, M. Lefebvre says:—"Having left Dima, we crossed a country decimated by war and famine, and a second time reached the Nile. At the part at which we arrived, the river flows over a bed of primitive rocks, modified by volcanic action. The river is narrow, and the Portuguese had constructed a bridge, which was destroyed by the Abyssinians. The river being very deep, the only mode of passing over baggage is by means of ropes or leathern thongs, which are held on each bank. In this way we passed over our baggage. Whilst this was doing, Dr. Petit, contrary to my advice, and that of the Abyssinians who were with us, went lower down to a place where the river is wider and more shallow, and which serves as a ford for the mules. Not knowing how to swim, he placed himself in the water, held on each side by a negro. He had almost reached the opposite bank, and his servants had come to tell me that he had effected the crossing, when suddenly a piercing cry struck on my ear. I ran to the spot, but too late, finding only the two negroes, who informed me that the doctor had suddenly let go his hold, uttering the cry that I had heard, and then fell into the water, never again to appear. Not the slightest doubt could be entertained that he had been seized by a crocodile. We remained for a long time on the spot, watching with anxiety, and in the hope at least of recovering the body, but in vain. The stream replied only to our straining eyes by exhibiting its ordinary calm surface."

Another American Hoax.—A great "sensation" was produced in New York on the 13th ult. by the publication in an extra sheet of the *Sun* of a long and formal account of an aerial voyage across the Atlantic, performed in three days. The voyage is minutely journalised, the peculiar construction of the balloon is described with great gravity, and in quite a scientific style, and illustrated by a large wood-cut, the whole being introduced by the following announcement, printed in great capitals:—"Astounding news! by express *vid* Norfolk. The Atlantic crossed in Three Days! Signal triumph of Mr. Monck Mason's Flying Machine!! Arrival at Sullivan's Island, near Charleston, S.C., of Mr. Mason, Mr. Robert Hollond, Mr. Henson, Mr. Harrison Ainsworth, and four others, in the steering balloon Victoria, after a passage of 75 hours from land to land." "Full particulars of the voyage" occupy nearly five columns of the paper. The whole thing would do honour to Professor Mirge Geolls of Mittlelills, and it seems it produced much the same effect in New York as the professor's *jeu-d'esprit* caused in London last year.

Law.

HOUSE OF LORDS.—COMMITTEE FOR PRIVILEGES.—*The Dukedom of Sussex.*—On Thursday "the case of Sir Augustus Frederick D'Este, on his claim to the Dukedom of Sussex, the Earldom of Inverness, and the Barony of Arklow," came before the Committee for Privileges, in the House of Lords. Nearly all the Judges were present.—Sir Thomas Wilde, Mr. Earle, and Mr. James Wilde, appeared on behalf of the claimant, and Sir Thomas Wilde stated the case at great length. As it is impossible to follow the learned counsel through the whole of his arguments, and as great interest will naturally be felt in this extraordinary peerage claim, the following abstract of the case, and of the arguments upon which Sir Augustus D'Este's claim is founded, cannot but prove welcome to our readers. The claimant first sets forth his pedigree as the son of the late Duke of Sussex and Lady Augusta Murray, and then recites the letters patent of the 27th November, 42d George III., by which His Royal Highness Prince Augustus Frederick was created Baron of Arklow, Earl of Inverness, and Duke of Sussex, with a limitation to the heirs male of his body; and adds, that he (the claimant) is the only male issue of the marriage celebrated at Rome, A.D. 1793, between his said late Royal Highness and Lady Augusta Murray, daughter of the Earl of Dunmore. The marriage took place without previous communication with George III., and with the strictest secrecy; but the fact soon became known. The King was displeased at the event, and from the time it came to his knowledge every endeavour was made to cause a separation of the Prince from his wife. This was accomplished, in the first instance, by his Royal Highness being immediately sent abroad, and after several short periods of residence together, the desired object of a permanent separation was attained in the year 1806, the claimant and a daughter being the only children of the marriage. On the death of his royal parent, the claimant presented his petition to Her Majesty, claiming the dignities of Baron of Arklow, Earl of Inverness, and the Duke of Sussex, which petition was referred to the consideration of the Attorney-General, who, having heard the evidence in support of its allegations, made his report in August, 1843. From that report it appears that the fact of a marriage between the late Duke of Sussex and the claimant's mother having been celebrated at Rome, was proved; but with the view of establishing the lawfulness of that marriage, and of showing that its validity was not affected by the provisions of the Royal Marriage Act, 12 George III., c. 11, a statement of the circumstances under which the marriage took place is relied on by the claimant. In the course of a detailed narrative of those circumstances, Sir T. Wilde strongly relied on the fact, that neither the sense which both the Prince and the claimant's mother entertained of the sufferings and disasters which their union had wrought, nor the feelings consonant upon the disagreement which put an end to the union, ever once induced either of them to deny the fact of the marriage at Rome, or to express any doubt in their own minds as to the legal validity of that marriage. It was given in evidence that his late Royal Highness repeatedly acknowledged and treated the claimant as his legitimate son; indeed, one letter, written in 1804, is directed by the Duke. "To my dearly beloved son, Prince Augustus Frederick, No. 40, Lower Grosvenor-st., Grosvenor-sq., London." Sir. T. Wilde stated that Her Majesty, having been pleased to refer the claimant's case to the consideration of the House of Peers, and the House having referred the petition to the Lords' Committee for Privileges, this case was therefore now submitted by the claimant to their lordships; and these three principal questions were propounded for their lordships' consideration.—First, the question of fact as to the marriage, upon which he relies, as having been contracted at Rome; secondly, the legality of that marriage. And upon these two points Sir T. Wilde hoped that little difficulty would be found in the way of their lordships' conclusion in his favour. The third question was, whether a marriage contracted by a descendant of his late Majesty George II., out of Her Majesty's dominions, and legal in all other respects, is rendered invalid by the operation of the statute 12 George III., c. 11, commonly called the Royal Marriage Act. Whatever impression might be received from the first view of the question, he confidently anticipated that a due investigation of the general principles of international law and of local legislation, upon which the proper construction and effect of the statute will depend, and by which it must be governed, will in its result abundantly satisfy their lordships that that statute does not invalidate the marriage upon which the claimant relies, or defeat his claim, as the legitimate offspring of that marriage, to succeed to the honours of his Royal parent. At the close of Sir T. Wilde's address, the House adjourned *sine die.*

POLICE.—On Wednesday, at Bow-street, *Ellen Lindsay*, a housemaid employed in Buckingham Palace, and *Elizabeth Lindsay*, a linen-woman, her sister, were brought before Mr. Hall, charged with stealing a quantity of blankets, counterpanes, linen, and other articles of a similar description, value about 40*l.*, the property of her Majesty, and *James Lindsay*, their brother, a surgeon, residing at 25, Upper Eaton-street, Pimlico, was charged with receiving the same, well knowing them to have been stolen. The male prisoner said he always considered the articles brought to him belonged to his sisters, as they had told him so, and he only took charge of them without examining what they consisted of. The prisoner Elizabeth said she considered the linen her own, as her mother, who was dead about fourteen years, had left it to her sister, who deposited it with her when she was living at St. James's Palace, and she occasionally used it for the household, when pressed for such an article, but as to the four bound blankets, they were given to her by the late Sir T. Mash, as being condemned in his late Majesty's reign. The prisoner Ellen, after agreeing with the principal part of her sister's statement, said she could not account for the counterpane unless that it might have been in her possession by mistake instead of her own. After a long inquiry, the prisoners were remanded.—At Queen-square, the magistrates have been occupied this week with a revolting case, in which a woman, called Harriet Eleanor Pelham, and her son, Wilson Pelham, were charged with having confined a young man, called Brent Spencer, the natural son of the female prisoner, by the late Gen. Sir Brent Spencer, and stated to be a lunatic, for whom the general made a liberal provision. From information received, the police forced an entrance into the house, when, according to the evidence of one of the witnesses, one of the most revolting scenes that had ever come within his view during a very lengthened experience, burst upon them. On a small straw bed lay a poor human creature of the male sex, without one morsel of clothing more than an old and filthy rag, which might be termed a shirt, and a small piece of flannel or blanket. Beneath him was a hole rotted through the filthy straw of the bed, and maggots and loathsome vermin of every description were crawling over his frame, which was so obscured by filth that it was almost difficult to discern in him a human being. His beard reached nearly down to his middle, and his nails protruded some inches beyond his toes. The unfortunate man was at once removed to the workhouse, where he is properly taken care of, and the two prisoners were remanded for further inquiries, but have since been admitted to bail.

SPORTING.

EPSOM RACES.—These races commenced on Tuesday, and a duller commencement was never witnessed. The meeting was an extremely thin one, confined to those peculiarly interested in horse-racing. A few early showers fell, and towards noon the clouds cleared away, and then succeeded a sunny and genial afternoon. The rain was barely sufficient to lay the dust, and the course was as hard as wood pavement.

TUESDAY.—*Craven Stakes* of 10 sovs each: for three yrs old, 6st 8lb; 4 yrs, 8st 10lb; 5, 9st 4lb; six and aged, 9st 10lb. Craven course. Mr. Ford's Odd Mixture, 3 yrs, beat Hon. S. Herbert's ch c, by Elis out of Odessa, 3 yrs; Baron Rothschild's c, by Defence out of Negress, 3 yrs; Mr. Dawson's br c Dalesman, 3 yrs; Sir G. Heathcote's bl f, by Velocipede out of Miss Wilfred, 3 yrs; and Mr. J. Osborne's b c Boniface, 3 yrs. Won by a neck.—*Woodcote Stakes* of 10 sovs each, with 50 added, for two-yrs-olds: colts, 8st 6lb; fillies, 8st 3lb. New T.Y.C. Mr. Edwards's f Full Sail, by Liverpool, beat Mr. S. Scott's br by Wintonian out of Flight; Lord G. Bentinck's b c Nereus, by Glaucus; Sir G. Heathcote's br c Chapow, by Muley Moloch; Mr. T. Hussey's b f Loadstar, by Liverpool; and Mr. Smith's c by Jerry, d by Wiseacre. Won by half a length.—*Manor Stakes* of 5 sovs each, with 40 added: for three years old, 6st 10lb; four, 8st 7lb; five, 8st 12lb; six and aged, 9st 11lb. Mares and geldings allowed 3lb. Winner to be sold for 300 sovs, the second to save his stake. Heats, two miles. Mr. Wilson's ch h Hampton, by Ascot, 5 yrs, beat Mr. C. Arundale's br g Jamie Falshaw, 4 yrs; Mr. Withy's b m Ellen, 5 yrs; Mr. A. Prescott's b g Bosphorus, aged; and Mr. King's ch f Nubia, 3 yrs. First heat won by a length, the second by a head.

WEDNESDAY.—Considerable interest was excited this morning in the sporting circles on finding that the course was strongly guarded by a large body of London police, horse and foot, sent down by the Secretary of State, to carry into effect his orders for the suppression of gambling booths. The inhabitants on the previous day had memorialised Government to withdraw their prohibition, but they received an answer that Sir J. Graham's determination to suppress gambling on race courses was irrevocable. The Grand Stand and course were crowded with visitors to witness the races of the day, which came off in the following order. THE DERBY STAKES of 50 sovs each, h ft, for three-year-olds; colts, 8st 7lb; fillies, 8st 2lb; the owner of the second to receive 100 sovs out of the stakes, and the winner to pay 100 sovs towards the police. Mile and a half. (155 subs.) Mr. A. Wood's b c Running Rein, by The Saddler, out of Mab, beat Colonel Peel's b c Orlando, Colonel Peel's b c Ionian, Colonel Anson's b c Bay Momus, Mr. J. Day's b c The Ugly Buck, Mr. J. Day's b c Voltri, Mr. Crockford's ch c Ratan, and the following 22 horses:—The Auld Squire, Akbar, Campanero, Qui Tam, Phalaris, Mount Charles, Croton Oil, Beaumont, Leander, Needful, The Ashtead Pet, Ella, the colt out of Delightful, Amulet colt, Loadstone, Lancet, Telemachus, King of the Gipsies, British Tar, Beaufront, Cockamaroo, Dick Thornton, and Elemi. Running Rein maintained his lead, and won easily by nearly a length. Thus the two favourites, who ran so closely to each other in the betting circles, and who stood for so long a time in public estimation at an extraordinary distance from the others, were completely beaten—Ugly Buck by four horses, and Ratan by six. Orlando beat Ionian by about two lengths, and the latter Bay Momus by a neck. All were placed, a departure from the ordinary rule, occasioned and justified by the protests lodged previous to the race. The Ugly Buck was a bad fifth, Akbar next at his girths, and Ratan seventh; the others were beaten so far that it would be idle to speak of the order in which they passed the winning chair. The pace was tremendous throughout. Value of the stakes, 4250*l.* Shortly after the race the stakes were claimed by Colonel Peel, on the same grounds upon which the protests were made previous to the race, viz. that Running Rein is disqualified by age, being supposed to be a five-year old instead of a three-year old. Col. Peel will have to produce proof of the alleged disqualification, and until the case be decided, the Stakes of course will not be paid.—*Epsom Stakes* of 5 sovs each, with 35 added; three-year olds, 7st 10lb; four, 8st 11lb; five, 9st 2lb; six and aged, 9st 6lb; mares and geldings allowed 3lb. Winner to be sold for 120 sovs. One mile. Lord G. Bentinck's Misdeal, 5 yrs, by Camel, beat Mr. Stanbrough's b h Isleworth, 5 yrs; Mr. Balchin's Moustache, 3 yrs, and 5 others. Won by a length. Winner claimed.—*Walton Stakes* of 5 sovs each, with 35 added; three year olds, 7st 10lb; four years, 8st 11lb; five years, 9st 2lb; six years and aged, 9st 6lb. Winner to be sold for 120 sovs. Three quarters of a mile. New T.Y.C. (10 Subs.) Mr. Booth's Camelino, aged, beat Gen. Wyndham's Hashed Venison, 3 yrs; Mr. Payne's Audrey, 3 yrs, and 4 others. Won by a length.—*Burgh Stakes* of 5 sovs each, with 35 added; three-year olds, 8st 2lb; four years, 8st 11lb; five years, 9st; six years and aged 9st 4lb. Winner to be sold for 80*l.*, &c. Last half mile. (12 Subs.) Mr. E. R. Clarke's Llangollen, 5 yrs, beat Mr. Greville's Molly Mogg, 3 yrs; Sir W. W. Wynne's Era, 3 yrs; and Mr. Death's Light Dragoon, aged, which fell with its rider, F. Butler, who was thrown with great violence and seriously injured. Four other horses started, but were not placed. Won easily by a length.

THURSDAY.—*Epsom Four-years-old Stakes* of 50 sovs each, h.

ft.; for colts, 8st 11lbs. and fillies 8st 6lb. Derby course, mile and a half. 7 Subs.—Sir G. Heathcote's Khorassan, walked over.—*Sweepstakes* of 10 sovs each, 5 ft., if declared, &c., with 50 added; three-years-old, 6st 10lb; four, 8st 12lb; five, 9st 6lb., six and aged, 9st 10lb, &c The second saves his stake. One mile and a quarter. 16 Subs. 2 paid —Mr. Owen's b c by Clearwell out of Nininka, 3 yrs, to be sold for 150*l.*; beat Mr. Stanbrough's Isleworth, 5 yrs; Lord W. Powlett's Falconer, 3 yrs, and 10 others. Won in a canter by two lengths, Falconer a bad third; the others beaten off. The winner claimed him.—*Surrey Handicap Cup* of 200*l.*, and 300*l.* (in specie), by Subs. of 10 sovs. each, with 50 sovs. added from the fund. Cup Course, two miles. 51 Subs. Lord Verulam's Robert de Gorham, 5 yrs, 8st 6lb, beat Lord Lonsdale's Blackdrop, 4 yrs, 7st 6lb; Mr. Forth's Lucy Banks, 5 yrs, 8st, and 13 others. Won in a canter by two lengths.—*Sweepstakes* of 5 sovs each, with 40 added; three yrs old, 6st 7lb; 4 yrs, 8st 7lb; 5 yrs, 8st 12 lb; 6 and aged, 9st 11lb. Winner to be sold for 150*l.* Heats, one mile. 7 Subs. Mr. Dawson's Dalesman, 3 yrs beat Mr. King's Nubia, 3 yrs; Mr. E. R. Clark's Chummy, 5 yrs; Mr. Balchin's Crocus, 4 yrs; Mr. A. Johnstone's Broadholm, 4 yrs, and Mr. Theobald's Mountain Dew, 3 yrs. The first was a dead heat between Crocus and Chummy; the second won by a neck, the third by a neck, the others in a canter.

FRIDAY.—THE OAKS STAKES—of 50 sovs each, h ft; 3 yr old fillies, 8st 7lb; the second to receive 100 sovs out of the Stakes. Last mile and a half. Col. Anson's The Princess, beat Lord Exeter's Merope, Mr. Gregory's Barricade, and twenty-five others. Won easily. Aurora did not start.—*The Members' Plate* of 50 svs., for three years old, 6st 7lb; four, 8st 9lb; five, 8st 13lb; six and aged, 9st 2lb; mares and geldings allowed 3lb; winner to be sold for 200 svs. Entrance 1 sov., to go to the second horse. Heats; two miles. Mr. Dawson's br c Lord Saltoun, beat Mr. Osborne's bl c Boniface. *The Derby and Oaks Stakes* of 5 sovs each, with 40 added; three years old, 7st 4lb; four, 8st 2lb; five, 9st; six and aged, 9st 2lb. Winner to be sold for 120 sovs, &c.; second horse to receive back his stake. Heats; one mile. Lord G. Bentinck's Misdeal beat Mr. Prescott's Bosphorus.

BIRTHS.—On the 10th inst., at Curry Rivell, Somerset, the lady of the Rev. C. S. GRUEBER, of a daughter—10th inst., at Dresden, MADAME DE GERSDORFF, lady of His Saxon Majesty's Minister Resident at the British Court, of a daughter—16th inst., at Antwerp, the lady of J. M. FRASER, Esq., of a son—17th inst., at 11, Fitzwilliam-square South, the Hon. Mrs. K. HARMAN, of a daughter—17th inst., at Tenby, Wales, the lady of J. REES, Esq., of a daughter—18th inst., at Langley-house, Bucks, the wife of the Rev. H. T. ATTKINS, of a daughter—19th inst., the wife of J. C. PARROTT, Esq., Clapham-common, of a daughter—19th inst., at 76, Cadogan-place, Mrs. F. W. WILLISFORD, of a son—19th inst., at Goldings, LADY T. FARQUHAR, of a son—20th inst, at Hendon, Middlesex, the lady of A. HALL, Esq., Madras Civil Service, of a son—20th inst., at Mells Rectory, Somersetshire, the lady of the Rev. R. THORP, of a son.

MARRIED.—On the 14th inst., at Plymstock, Devon, N. WERE, Esq., solicitor, Plymouth, to SOPHIA HARRIS, second daughter of C. Harris, Esq., of Plymouth, banker—15th inst., at Barking, in the county of Suffolk, J. B. WALKER, Esq., of Iver, Bucks, to ELEANOR ROBINSON, only child of the late R. Robinson, Esq., of Westminster—16th inst., at Curry Rivell, Somerset, H. B. NORMAN, Esq., of Duchess-street, Portland-place, London, surgeon, to HARRIET J. ALFORD, fifth daughter of the Rev. S. Alford, M.A., Heale-house, Curry Rivell—16th inst., at St. Botolph's, Aldersgate, the Rev. J. W. BARNES, M.A., Fellow of Trinity College, Cambridge, and vicar of Kendal, to EMMA L. LESTOURGEON, daughter of C. Lestourgeon, Esq., late of Cambridge—16th inst., at All Souls, J. G. FORBES, Esq., of Oxford-terrace, Hyde Park, only surviving son of the late Captain J. K. Forbes, Hon. East India Company's Service, to HARRIET E. MCINTYRE, eldest daughter of W. McIntyre, Esq., M.D., of Harey-street—18th inst., at Emmanuel Church, Camberwell.

DIED.—On the 14th of March, at sea, suddenly, on board the Thomas Coutts, H. F. BOADEN, Esq., son of the late J. Boaden, Esq., well known in the literary and dramatic world. For a long period he filled the responsible situation of agent to Her Majesty's Navy in Bombay, to the entire satisfaction of the Crown, and for a series of years was the confidential adviser of Sir Jamsetjee Jejeebhoy—13th inst., Captain M. HUTCHINSON, late of the 53d Regiment, third son of the late G. P. Hutchinson, Esq., of Egglestone, in the county of Durham—13th inst., at Bilting, Godmersham, Kent, W. H. BEE-HIVES.—GEORGE NEIGHBOUR & SON beg to inform their Apiarian friends that they have prepared for the season a large supply of "Nutt's Patent Bee-hives" (for the sale of which they are the only authorised agents), in which are embodied all the recent improvements. Their selection now comprehends most varieties in general use at the present time, including the "Single Box Hive," the "Ladies' Observatory Hive," the "Improved Cottage Hive," with glasses, &c., from either of which the produce may be taken at any time of the gathering season, without destroying the Bees.

G. N. & SON have also Glass Hives, and other articles connected with Bee management, a catalogue of which, with drawings, may be obtained. Letters of inquiry must have postage stamps inclosed.—Apiarian Depot and Honey Warehouse, 127, High Holborn, London.

NUTT ON BEES, Fifth Edition, now Published.

DRESS AND FROCK COATS.

DRESS COATS, Superfine Cloth, 27*s.*; extra quality, 35*s.* and 40*s.*; Imperial Saxony, 50*s.*; Frock Coats, Silk Facings, 30*s.* to 40*s.*, extra quality, Silk Velvet Collar, and Silk facings, 48*s.*; Saxony ditto, 55*s.*; Children's Silk Tunic and Hussar Suits, 30*s.*; Waistcoats, new patterns, 5*s.* 6*d.* to 10*s.* 6*d.*; Trousers, 6*s.* 6*d.* to 10*s.* 6*d.*; excellent Doeskin, 12*s.* to 16*s.*; Summer Coats, 6*s.* 6*d.* to 10*s.* 6*d.*; Chesterfield Over Coats, with Silk Collars and Cuffs, 15*s.* to 21*s.* The much approved new style, 21*s.* A suit of Black Cloth, 2*l.* 5*s.*; extra quality, 3*l.* 3*s.*; Imperial Saxony Suit, warranted to retain its colour, 4*l.* 4*s.*, at FISHER and Co.'s, Tailors, 31, King William Street, City, 10 doors from London Bridge.

BERDOE'S SUPERIOR REALLY WATERPROOF FROCKS, for the present season. An extensive variety of the above, in NEW and greatly improved materials (in lieu of the unsightly rubbish made by slopsellers), now ready, guaranteed to exclude any rain whatever; and confidently recommended to those who regard a respectable appearance, or wish to avoid disappointment and vexation.

FIRST-RATE CLOTHING of every description, upon the lowest terms possible, consistent with TRUE economy, and ultimate satisfaction.—W. BERDOE, Tailor, Waterproofer, &c., 69, Cornhill (north side).

DRAWING-ROOM CLOCKS.—A. B. SAVORY and SONS, No. 9, Cornhill, London, opposite the Bank of England, invite attention to a splendid variety of Rosewood, China, Bronze, and Ormolu CLOCKS; they go for eight days and strike the hours and half-hours. Price 4 guineas, 7 guineas and 10 guineas each, and upwards. The performance is warranted.

A Pamphlet, with detailed lists of Prices, and illustrated with sketches, may be had on application gratis, or sent to all parts of Great Britain and Ireland, postage free, in answer to a post letter.

NECESSARY PRECAUTION.—CONSUMERS of BRANDY are respectfully informed that J. T. BETTS, jun. and Co. will not be responsible for any buttled Brandy that is not protected against fraudulent substitution, by the Patent Metallic Capsules, embossed with the words, "Betts's Patent Brandy, 7, Smithfield Bars." Sold by the most respectable Wine and Spirit Merchants, in Town and Country, at 3*s.* 6*d.* per bottle, the bottle included.

BURBIDGE AND HEALY'S COOKING APPARATUS, combining Sylvester's Patents.—This Cooking Apparatus is believed to possess greater general advantages than any yet submitted to the Public, both as regards strength of material and workmanship; in fact, the laws of heat are so applied as to produce the greatest effect with the least consumption of fuel, without destruction to the Apparatus; and B. and H. can safely recommend it from experience, as unquestionably superior to anything of the kind hitherto made. A Prospectus can be forwarded, upon application, detailing particulars and prices, to 130, Fleet-street.

METCALFE'S NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most effectual and extraordinary manner, and is famous for the hairs not coming loose—1*s.* An improved Clothes Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh Brushes, of improved graduated and powerful friction. Velvet Brushes, which act in the most surprising and successful manner. The Genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE'S Sole Establishment, 130B, Oxford-street, one door from Holles-street.

Caution—Beware of the words "From Metcalfe's," adopted by some houses.

TO LADIES.

ROWLAND'S KALYDOR.—This Royally Patronised and universally adopted Specific is a balmy, odoriferous, creamy Liquid, composed chiefly of extracts from the most rare Flowers and Herbs of an Eastern Clime. Its discovery was no less singular (by a Lady of rank), than its effects have been felicitous, during the last thirty years. It is the mildest and most efficacious preparation ever known for dissipating Tan, Pimples, Freckles, Discolorations, and other Disfigurements of the Skin. The radiant bloom it imparts to the Cheek, and the softness and delicacy it induces on the Hands, Arms, and Neck, render it indispensable to every Toilet.

Gentlemen will find it peculiarly grateful after shaving, in allaying irritation of the skin, and in rendering it soft and smooth.

Price 4*s.* 6*d.* and 8*s.* 6*d.* per Bottle, duty included.

CAUTION.—The great demand for this article excites the cupidity of *unprincipled Shopkeepers*, who vend the most *spurious trash* as the "GENUINE KALYDOR:"—whereas the genuine article is prepared solely by A. ROWLAND and SON, and the amalgamation of its *costly exotic* materials renders abortive any attempt to discover its component parts—thus proving the imposition of all other articles bearing the title of "KALYDOR." The genuine article has the words "ROWLAND'S KALYDOR" on the Wrapper.

*** All others are FRAUDULENT COUNTERFEITS!!!

WANTED, as GARDENER, a young Man, who must be well acquainted with Kitchen and Flower-Garden and Frames; no stove or greenhouse. He must have a good character from a gentleman with whom he has lived. A married Man preferred, as he will be required to live in a cottage near the garden, and he must be willing to turn his hand to whatever is required of him. Wages 15*s.* a week and an unfurnished cottage; about 15 miles N.E. of London.—Apply, post paid, to A. B., at Spencer's Library, No. 314, High Holborn.

WANT PLACES.—All Letters to be post-paid.

AS FOREMAN AND PROPAGATOR in a Nursery, a middle-aged Man, who can produce good testimonials as to character, &c. Direct to A. B., care of Mr. BAKER, 61, Tooley-street, Boro'.

AS GARDENER.—A young Man, aged 27, who has had an extensive practice in the cultivation of Pines, Vines, and Forcing generally; can have most undeniable reference as to character and abilities.—Direct to I. H., Chalk-hill Lodge, Kingsbury, Middlesex.

AS GARDENER, in a Nobleman or Gentleman's Family.—A young Man, who understands his business in all its branches, including Pines, Vines, &c. He has lived in families of rank, both in England and Scotland, and can be highly recommended by his late employers. No objection to live in or out of the house.—Direct to R. F., Mr. CARTER, 238, High Holborn, London.

AS GARDENER.—JAMES ROBERTS (Author of a "Comprehensive View of the Culture of the Vine under Glass"), late Gardener to Matthew Wilson, Esq., Eshton-hall, Skipton, Yorkshire, is now at liberty to engage with any nobleman or gentleman, having been engaged by his venerable and esteemed employer (with whom he has been ten years), in designing and completing extensive new Kitchen and Forcing departments, Pleasure Grounds, Flower Gardens, &c. &c., which are in the highest state of cultivation. As such he begs to refer to the reports of the London Horticultural Society—to their awards of Medals. Would be glad to engage with any Nobleman or Gentlemen contemplating extensive improvements, or requiring a Gardener in the highest departments of his profession, more especially in the culture of Exotic Fruits. Can produce the highest testimonials; is married, and aged 40. Letters addressed as above shall have his best attention.—Direct to the office of this Paper.

A YOUNG MAN from the Country, 19 years of age, wishes to obtain a knowledge of Gardening under any Gentleman's Gardener; Forcing, Pruning, &c.—Direct, stating all particulars, terms, &c., A. Z., Mr. KERNAN, Seedsman, 4, Great Russell Street, Covent Garden.

A GENTLEMAN who is leaving his Country Residence is desirous of obtaining a Situation for his GARDENER, whom he can highly recommend as a competent Gardener; he can manage land and stock; and his wife can undertake the Laundry. A Character of three years will be given.—Direct, A. B. C., care of the Gardener, Shelsham Lodge, near Croydon, Surrey.

AS FARM-BAILIFF.—A married Man, without encumbrance; the Man understands Farming and Stock, and his Wife the Dairy and Poultry; they are both willing to make themselves useful, and can have a good character from their employer.—Direct to M. M., at Mrs. Hancock's, Bedford-road, Clapham, Surrey.

A LADY, of middle age, and who has high testimonials, wishes to Engage with a Family wherein the services of an Experienced Matron would be valuable.—Direct to M. S., 4, Swallow-street, Piccadilly.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

THE ROYAL AGRICULTURAL SOCIETY OF ENGLAND is desirous of receiving TENDERS from Innkeepers, or others, to CONTRACT for any one or more of the following SUPPLIES, at the ensuing Annual Country Meeting of the Society, to be held at Southampton in July :—

I.—A Hot Dinner for 400 persons, with Dessert, and a Bottle of Port, Sherry, or Bucellas, to each person, in the Victoria Archery Rooms, Southampton, on Wednesday, the 24th July, 1844.

II.—A Cold Dinner for 1200 persons, with a Pint of Port, Sherry, or Bucellas, to each person, in the Pavilion of the Society, on the Fairfield, Southampton, on Monday, 25th July, 1844.

III.—Refreshments suitable for 200 Ladies, in the Gallery of the Pavilion, on the same occasion.

Printed Forms of Tender will be forwarded to parties applying to the Secretary, and must be returned to him, filled up, on or before Monday, the 10th of June, to the Office of the Society, No. 12, Hanover-square, London ; the Society not binding itself to take the lowest tender.—By order of the Council,

JAMES HUDSON, Sec.

HAMPSTEAD FLORIST SOCIETY.—The First and principal Exhibition for 1844 will take place on Thursday, June 13, in the grounds of J. Jackson, Esq., near Jack Straw's Castle, Hampstead Heath. The Exhibition will open at One o'clock to Visitors. Admittance One Shilling. A Band will be in attendance. WILLIAM GOULDING, Secretary.

EXHIBITION OF AMERICAN PLANTS.

H. AND J. WATERER beg to acquaint their numerous patrons that as they are not able to have their Show in the King's-road, Chelsea, this season, the AMERICAN PLANTS at the Knaphill and Bagshot Nurseries will be unusually splendid. The Azaleas and Rhododendrons are now in high perfection, and may be seen any day except Sunday, gratis. The Knaphill Nursery is 2½ miles from the Woking Station on the S. Western Railway, from whence conveyances may always be obtained on application to Stephen Moore.

2. JOHN BLAYLOCK, second application, aged 72.
3. ELIZABETH COLLYER, second application, aged 70.
4. ROBERT CRACKNELL, first application, aged 72.
5. GEORGE MARTIN, first application, aged 66.
6. ALEXANDER UPTON, first application, aged 75.
7. JOHN WELLARD, first application, aged 71.

Any Subscriber not having received his Polling Paper, is requested to apply for it immediately.

E. R. CUTLER, Secretary, 97, Farringdon-street.

THOMAS CRIPPS, NURSERYMAN, Tunbridge Wells, respectfully informs his Friends and the Public, his annual Catalogue of Fuchsias, Phloxes, Petunias, &c., which is now ready, will, independently of the new kinds raised in this country, be found to comprise many foreign varieties, which are for the first time offered for sale. Applications for prepared Catalogues will meet with immediate attention.

MESSRS. J. and H. BROWN, respectfully offer to the Nobility and Gentry the following Plants for Bedding Out, &c.

	s	*d*
Alstrœmerias, 10 vars, each	1	6
Auriculas, fine, per dozen, 12*s*. to 18	0	
Calceolarias, 12 best varieties, per dozen . 4*s* to	6	0
Campanula grandis, and others, per doz. . .	6	0
Chrysanthemums, best, per dozen . . .	0	0
[Selection left to Purchaser.]		
Dianthus Goethaelsii, do.	6	0
Euthalis microphilla, fine for beds, per doz. .	12	0
Fuchsia exoniensis, each	3	6
,, ,, . .		
Fuchsias, 25 of the newest and most approved, per dozen . . . 6*s* &	12	0
Galardia picta, per doz.	6	0
Gazania, 3 vars., ,, .	9	0
Geraniums, Scarlet, Variegated, &c. . 4*s*, 6*s*, &	9	0
Geum coccineum, per doz	6	0
Heliotropium, per doz. 4*s* &	6	0
Ipomœa rubra cerulea, p. doz.	6	0
Lantanas, per doz. . .	9	0
Lobelias, 6 vars., per doz.	6	0
Lilium, 6 newest varieties, per dozen . . .	12	0
Linum flavum, p doz. 6*s*. to	9	0
Mimulus elegans, a very beautiful variety, and others, do. . .	6	0
A Miscellaneous Collection of 100 Stove and Greenhouse Plants (the selection named by the purchaser in the order)	100	
New Border Pinks, per doz	4

Petunia punctata, each .	5	0
,, ,, .		
Petunias, 6 new varieties, per dozen . . 6*s* &	4	
Tropæolum tricolorum, and pentiphyllum, each from . 1*s*. 6*d*. to	10	6
Verbenas, 12 newest vars. per dozen . . 6*s* &	4	0

ROCK PLANTS.

25 Superior sorts . .	15*s*	50 Sup. Herbaceous plants	25*s*
50 do. do. . .	25	100 do. do. do. .	45

HARDY CLIMBERS FOR PLANTING OUT.

Aristolochia Sipho, each	1*s* 6*d*	Clematis Sieboldti, p. doz	18*s* 0*d*
Atragene Austriaca, each	1 0	Do. montana, p. doz	12 0
Bignonia radicans, each	1 0	Pyrus Deutziana and Cotoneaster, each . .	1 0
Do. do. major, each	1 6	Wistaria consequana, each	1 6
Ceanothus, 2 species, each	1 0	Honeysuckle, 6 vars., each	1 0
Calampelis scabra, each	1 6	Jasminum 4 vars. .	1 0
Clematis azurea grandiflora, per dozen . 24	0	Sollya, 2 vars., each .	0 9
20 varieties of Roses, each	1 6	Passifloras, 4 vars., each	1 0

HALF-HARDY OR SUMMER CLIMBERS.

Cobœa scandens, each .	0*s* 9*d*	Scypanthus elegans, each	1*s* 0*d*
Maurandya, 3 vars., each	0 9	Thunbergias, 4 vars. each	1 0
Lophospermum, 3 var each	0 9		

The above Plants carefully packed and forwarded to any part of the United Kingdom. A post office Order or reference for payment in Town. Persons erecting Greenhouses or Conservatories can be well supplied with the choicest and best of Plants for furnishing, including the many handsome Climbers recently introduced.

N. B.—Plants securely packed for exportation.—Albion Nursery, Stoke Newington, London.

GLOXINIA ROSEA ALBA ; Figured in the present Number of the "Florists' Journal."

EXTRACT. — "Our present illustration, G. rosea alba, is an hybrid obtained from seed of *candida*, impregnated with the pollen of *rubra*. Its beautiful intermediate colour at once proclaims its origin ; and we have no doubt it will speedily become a favourite."—*Florists' Journal*, May 1, 1844, by the Editor.

The flower is of a lovely and delicate rose colour, with a pure white throat ; habit of G. rubra, and a prolific bloomer.

Strong Plants now ready for sending out, at 7*s*. 6*d*. each ; discount to the trade, if three plants are taken. Apply to Wm. E. RENDLE, Union Road Nursery, Plymouth.—May 31, 1844.

WOODLANDS NURSERY, MARESFIELD, near UCKFIELD, SUSSEX.

WILLIAM WOOD AND SON respectfully invite the attention of Amateurs and their Friends to their extensive Stock of SUPERB NEW FUCHSIAS, consisting of upwards of 100 of the finest named sorts, which they are now prepared to send out, in very strong plants (hardened to the open air). A few of the most esteemed varieties are enumerated below, and will be supplied at 12*s*. per dozen sorts, or one plant of each for 18*s*. Alata, Britannia, Brockmannii, carnea, Champion, Cormackii, Defiance, Eclipse, Enchantress, Eppsii, Exoniensis, Lanei, Majesticus, Noblissima, Paragon, Robusta, Rogersiana, Stanwelliana, Transparens, Victory ; or 50 extra-fine varieties, including the above, for 40*s*. Fine varieties can also be supplied at 6*s*. and 9*s*. per dozen, when the selection is left to W. W. and Son.

Also, Strong Plants of the following SUPERB VERBENAS, at 12*s*. per dozen varieties, or one plant of each for 20*s*. Amethystina, Atrosanguinea, Barnsii, Beauty, Bishopii, Boule de Feu, Bridesmaid, Elegans (Youell's), Formosa elegans, Fortune-teller, Harlequin, Howardiana, Laconii, Lilacina, Longiflora, Minstrel Boy, Prince of Wales (Wood's), Princess Royal (Youell's), Renown, Rival King, Rosy Queen, Speciosa, Taglioni, White Perfection. Good named varieties at 5*s*. to 9*s*. per dozen.

ACHIMENES — grandiflora, longiflora, pedunculatus, and rosea, at 1*s*. each, or 9*s*. per dozen.

*** Catalogues of Camellias, Greenhouse, and Herbaceous Plants, Petunias, &c., will be forwarded on application.

SPLENDID NEW SEEDLING LOBELIAS.

F. C. BALL, NURSERYMAN, Taunton, (successor to Mr. JOHN YOUNG,) begs to offer the following as decidedly the best Scarlet Lobelias known, viz. :—

Lobelia fulgens multiflora.
,, ,, ,, variety.
,, ,, pyramidales.

All partaking of the free growth of L. iguea, and in colour and size of flower far exceeding the vivid scarlet of L. fulgens ; particularly the first, which is also very desirable from its robust habit and long continuance in bloom. Last season in the greenhouse its flowers were conspicuous for four months. Plants are ready for immediate delivery, price 5*s*. each.—May 31, 1844.

CLOTH OF GOLD NOISETTE ROSE.—Mr. CURTIS having a strong Stock of this very desirable novelty, begs to offer good Plants at 10s. 6d. cash. Carriage of Packages paid to London per Great Western Rail.
West of England Rose Nursery, Moorend, near Bristol.

PLANTS FOR BEDDING OUT, to be had of MARNOCK & MANLEY, NURSERYMEN, Hackney, London.

	per doz.—s.	s.
Geraniums, scarlet and others, strong plants	6	to 9
Fuchsias, 100 varieties	6	12
Verbenas do.	4	6
Petunias	4	6
Malva decumbens, new	9	
Salvias,—in varieties	4	6
Bouvardias do.	6	9
Lantanas do.	9	
Lobelias do.	6	

	per doz.—s.	s.
Anagallis,—in varieties	6	to 9
Alstroemerias do.	9	
Heliotropium	4	6
CREEPERS.		
Maurandyas, 4 varieties	6	9
Cobœa scandens	6	9
Lophospermums	9	
Rhodochiton volubile	12	18
Kennedya	9	12
Sollya heterophylla	9	

With every other variety of Bed and Creeping Plants, at moderate prices, sent free within 10 miles of London, if to the amount of 20s. and upwards, or packed for the country. A descriptive Catalogue may be had on application.—Nursery, Hackney May 31.

WHITE HART HOTEL, BROMLEY, KENT.

WM. PAWLEY begs to inform the Nobility and Gentry that in consequence of the numerous orders he has received, he intends sending out early in the autumn, at 10s. 6d. per plant, a SEEDLING FUCHSIA of 1844, named "CASSANDRA," a specimen of which will be exhibited on Tuesday next, at the Botanic Gardens, Regent's Park.
Queen, Prince of Wales, and Magnet, are now in full bloom, and the three can be had for one guinea.

NEW DAHLIAS, GERANIUMS, FUCHSIAS, &c. &c.

J. HARRISON, NURSERYMAN, York, can supply fine strong Plants, fit for immediate planting, of the undernamed DAHLIAS, &c., at 6s. each:—Aurantia, Claudine, Constance, Gauntlet, Lady Antrobus, Madeline, Romeo, Vanquisher, Emma Noak, Park's Mount Rival, &c.; at 8s. each, Beauty of Birmingham, Lady Grey, Lord Howden, Lady St. Maur, Rival Rose, Standard of Perfection, Sir J. S. Richardson, Sir H. Pottinger; and at 10s. 6d., Nonpareil, Prince of Waterloo, Spitfire. Every other new variety at the lowest prices. The following at 1s. 6d. each:—Antagonist, Asmodeus, Admiral Stopford, Blanch Shelly, Beauty of Sussex, Colonel Baker, Competitor, Confidence, Essex Triumph, Favourite, Hero of Stonehenge, Mrs. Shelly, King of Lilacs, Mrs. Jas. Richardson, Perpetual (Grand), Surprise (Oakley's), Sir Robert Sale, Sultana, Violet Perfection, Vivid, Virgil, Victory of Sussex. Other good varieties, new last year, at 1s. each, or 8s. per doz. Good older varieties, 6s. per dozen; also a good variety in colours, not named, at 5s. per dozen. New Geraniums, Fuchsias, &c. at the very lowest prices, of which a Catalogue is now ready, and may be had on application to J. HARRISON, Nurseryman, York.—May 30, 1844.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.
SEEDSMEN.

THOMAS GIBBS AND Co., corner of Half Moon-street, Piccadilly, London, having had the honour of being officially appointed the SEEDSMEN to the "ROYAL AGRICULTURAL SOCIETY OF ENGLAND," beg to assure the Members of the Society, and their Agricultural Friends in general, that this renewed mark of confidence will stimulate them to continued and fresh endeavours to merit so high a distinction. Among other Seeds they beg to call attention to the following.

TURNIPS.

Purple Top Swedish Turnip (combining large produce with beauty of form and smallness of top).
Green Top ditto ditto (hardy and useful variety).
Gibbs's Green Top Yellow Hybrid (strongly recommended—will bear sowing later than Swedes, and next to the Swede in hardiness).
Gibbs's Red ditto ditto (same as the above, with red top).
Green Globe Turnip.
Early Stubble Turnip, and other varieties of known good qualities.

GRASS SEEDS,

For forming permanent Meadows and Pastures.
Mixtures of Selected Natural Grass Seed for the purposes above mentioned, proportioned and adapted to suit the nature of different soils.
Please address, THOMAS GIBBS and Co., the Seedsmen to the "Royal Agricultural Society of England," corner of Half Moon-street, Piccadilly, London.

WM. JOHN CORMACK, AGRICULTURAL SEEDSMAN by Appointment to His Royal Highness PRINCE ALBERT, New Cross, Surrey, and Bedford Conservatory, Covent Garden, begs to call the attention of the Nobility, Gentry, and Agriculturists in general to his combinations of GRASS SEEDS for Permanent Pasture, the Alternate Husbandry, Parks, Lawns, &c. (as recommended and practised by his partner, the late Mr. GEORGE SINCLAIR, Author of the "Hortus Gramineus Woburnensis.") Upwards of 25,000 acres have been converted to permanent pasture by this establishment with the greatest success. Parties requiring Seeds are respectfully requested to state the nature of the soils. Mangold Wurzel, Carrot, and Turnip-seed of excellent sorts, saved from transplanted bulbs. Garden and Agricultural Seeds of the best quality and most approved kinds.
N.B.—Cormack's British Queen and Prince Albert Peas, at 3s. 6d. per quart.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

IRON WORKS.

COTTAM AND HALLEN, WINSLEY-STREET, OXFORD-STREET, LONDON.

GARDEN ROLLERS and RICK-STANDS, or STATHELS, at very low prices.
GARDEN SYRINGES, 9s. 6d. each.
HAND-GLASS FRAMES for Cucumbers, &c., 18 inches square, 20 inches, and 22 inches.
CAST-IRON FLOWER-STAKES, 4 ft. long out of the ground, 4 ft. 6 in., 5 ft., 6 ft., and 7 ft.
Watering-pots, Garden Engines, Mowing Machines, Garden Chairs, Superior Garden Tools of all kinds, Garden Vases in great variety, and every description of article used in Horticulture.
BEST WIRE, for STRAINED WIRE-FENCING, at 8s. 6d. per bundle of 150 to 160 yards each.
Flower-bordering, Trainers, Garden Arches, Flower-stands, Rose-tree Guards, and every description of Ornamental Wire-work, for Gardens, &c.
HOTHOUSES, CONSERVATORIES, &c., made upon the most improved principle, either of iron or of iron and wood combined, which can be fixed complete in any part of the Kingdom, at very low prices.
HOT-WATER APPARATUS for heating Hothouses, Conservatories, and Greenhouses; Churches, Public or Private Buildings, &c., with COTTAM'S PATENT, or ROGERS'S BOILERS. After 15 years' experience, and having fixed upwards of 1500 Apparatus for the above-mentioned purposes, and by various improvements which they have made during that time.
RENDLE'S TANK SYSTEM on an improved simple plan.
Show Rooms at their Manufactory, No. 2, Winsley-street, where estimates and every information may be obtained.

AGRICULTURAL IMPLEMENTS.

DOUBLE-MOTION HAYMAKERS of the best construction, made almost wholly of iron, and containing the double Cylinder, and all the latest improvements, are now ready.
CAST-IRON RICK-STANDS and PIGTROUGHS, at very low prices.
IRON HURDLES AND FIELD-GATES of all sizes, at exceedingly low prices.
PLOUGHS, DRILLS, Sheep and Cattle Weighing Machines, Improved Prize Harrows, Field Rollers, Turnip-cutters Chaff-cutting Machines, Threshing and Winnowing Machines Oil-cake Breakers, and every description of Implements used in Agriculture.
Show Rooms at their Manufactory, 2, Winsley-street, Oxford-street, where every information may be obtained.

BURBIDGE AND HEALY'S NEW BOILER and FURNACE for HORTICULTURAL PURPOSES.
Registered under 6 & 7 Vict., Cap. 65.
No. 130, FLEET STREET, LONDON.

—BURBIDGE and HEALY respectfully inform the Horticultural Public that they have constantly on hand an extensive assortment of their new Boiler and Furnace Doors. In very numerous cases where they have been fixed, they have the highest testimonials of their complete success: for the further assurance of those who may require this apparatus, BURBIDGE and HEALY refer them to the Horticultural Society's Gardens, Chiswick; also to Mr. GLENDINNING, Garden Architect, &c. &c., Chiswick Nursery, in the same neighbourhood, where the apparatus may be seen in successful operation, in connection with their new Tanks. The following are the present prices:—

Plain Boiler.		Patent Door and Frames.	Fire-bars & Dead Plate.	Flue Door.	Damper.	Will heat of Pipe.	Forcing Pit, Length by feet.
in.	£ s.	s.	s. d	s. d	s. d		
10	1 5	20	7 6	6 6	2 6	30 feet.	12 to 20
Ribbed Boiler.							
10	2 2	20	10 6	7 6	2 6	50 to 70 ft. 4 in.	Under 25 to 40
12	2 15	30	12 6	7 6	3 6	80 to 125 feet.	40 to 65
14	3 10	35	17 5	8 6	4 6	150 to 250 feet.	65 to 100
18	5 5	42	25 0	8 6	5 6	300 to 400 feet.	Warm a grapery 35ft. long, and a pit 50ft.
24	8 15	50	35 0	8 6	7 6	600 to 800 feet.	

If 3-inch pipe be used, one-third more. If 2-inch pipe, as much more.

The above quantities are rough estimates, which may be varied by enlarging or contracting the fire, or by regulating the fire door. It is possible to heat a much larger quantity of pipe with the boiler, but it would be done at great loss of fuel. The above proportions can be generally relied on as a near approximation to what is correct.

RENDLE'S TANK SYSTEM OF HEATING.

STEPHENSON AND CO., 61, Gracechurch-street, London, Inventors of the IMPROVED CONICAL and DOUBLE CYLINDRICAL BOILERS, having been much engaged in heating buildings upon the above system with Tanks of various materials, solicit the attention of scientific Horticulturists to an Iron Tank now fitting up on their premises, which offers most decided advantages over every other article hitherto employed for the same purpose. These tanks, which are ornamental in appearance, can be made from 10 to 100 feet long and of any width and depth, and can be connected or disconnected by any working Gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of employing this much approved method of heating without the assistance of Engineers. The Tanks can be applied to Boilers and Pipes already fixed, and from the present low price of Iron will be found cheaper than of any other material. MR. RENDLE, of Plymouth, has kindly undertaken to receive orders and furnish information to any persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

A GREENHOUSE, Calico-coated with WHITNEY'S TRANSPARENT WATERPROOF COMPOSITION may be seen in use at the Grounds of BASS and BROWN, Seedsmen and Florists, Sudbury, Suffolk, appointed Agents for the sale of the Composition. The light is equal to glass; the plants exhibit a strong and vigorous growth, and a longer period for bloom is gained. Sold in bottles, with directions for use—quarts, 4s. 6d.; pints, 2s. 6d.
An extensive assortment of Greenhouse and Hardy Plants for bedding. Catalogues supplied.

TO GENTLEMEN, FLORISTS, and Others.

MESSRS. PROTHEROE & MORRIS will submit to public competition, at the Auction Mart, Bartholomew Lane, on TUESDAY, June 4, and THURSDAY, June 6th, at 12 o'clock each day, a fine collection of DAHLIAS, comprising all the leading Varieties. Also a splendid Assortment of Geraniums, the newest Varieties of Fuchsias and Verbenas, Heartsease, and a Variety of other flowering Plants. May be viewed the morning of Sale. Catalogues may be had at the Mart, and of the Auctioneers, American Nursery, Leytonstone.

CAPITAL INVESTMENT.—IMPROVABLE ESTATE IN AYRSHIRE, WITH SALMON-FISHINGS, GROUSE-SHOOTING, &c.—FOR SALE, IN ONE OR MORE LOTS.

THE ESTATE OF BALLANTRAE, extending to about 7164 acres imperial, with the Village and Harbour, and the valuable Salmon-Fishings of the River Stinchar and the adjacent Sea-coast.

The Lands immediately around the village, about 1587 acres, form a compact and beautiful Estate, lying on both sides of the River Stinchar, and nearly two miles along the Frith of Clyde; and they afford many fine situations for a residence. The land in this division is arable, of superior quality, and capable of great increase of value by draining, planting, and better cultivation. The remainder of the estate, about two miles distant, consists of excellent Stock Farms, capable also of great improvement, by surface draining and liming, and affords some of the best Grouse shooting in the south of Scotland. The River Stinchar, and other streams on the Estate, abound with Salmon and Trout.

The present rental is only 1891*l.* 2*s.*; but the principal Farms are let at very low rents, and a considerable rise may be counted on. The public burdens payable by the proprietor are of trifling amount. The great post-road to Portpatrick passes through the village, and if the proposed improvements on the harbour are completed, Ballantrae will be the Shipping Port of the whole Vale of Stinchar; and, with its valuable Fisheries, must become a place of some trade and importance. Ballantrae is about 15 hours' sail from Liverpool, 6½ hours' sail from Glasgow, and 12 miles from Girvan, to which latter place it is now in contemplation to continue the Ayrshire Railway.

If not immediately sold in one Lot, the Estate will be exposed as follows:—

1st. The MOOR LOT, extending to about 5577 acres, of which the present land rental is £375 0 0
And the shooting for the present season is let at . . 50 0 0

Total rent . £425 0 0

2d. The FARM of LAGGAN and LAGGANHOLM, as at present possessed by Hugh Lockhart, James M'Meikan, John Murray, Mrs. M'Kinna, &c., with 13 acres of thriving young Plantations, extending to about 450 acres, at present let at £416 4 3

There is a neat small modern Mansion on this lot, like a good Farmhouse, and the principal part of the Land is out of lease at Martinmas next.

3d. The REMAINDER of the LANDS of LAGGAN and GARLEFFAN, including the Mill and Mill Lands, extending to about 232 acres, at present let at £175 2 9

4th. The LANDS on North Side of the River Stinchar, with the Salmon-Fishing, Harbour, and Village, extending to about 905 acres, at present let at 87*l.* 14*s.* 9*d.*, will be exposed along with Lots 2d and 3d, but will not be separately sold till these two Lots are disposed of.

James M'Gregor, Ballantrae, will show the Lands; and for further particulars application may be made to George Guthrie, Esq., factor, Culhorn, near Stranraer; or to Æneas Macbean, writer to the signet, Edinburgh.—Edinburgh, 24th May, 1844.

SALE OF A SPLENDID COLLECTION OF HOTHOUSE GREENHOUSE, AND OTHER PLANTS.

T. M. FISHER respectfully announces that he is directed by Mr. WM. LODGE, to Sell by Auction, on Wednesday and Thursday, the 19th and 20th days of June next, at the Nursery Grounds, Broughton-lane, Lower Broughton, in consequence of his Removing to Broughton Park, Higher Broughton, the whole of his excellent COLLECTION OF PLANTS, consisting of fine specimens of Geraniums, a splendid collection of Fuchsias, Camellias, Ericas, Achimenes, Calceolarias, Cinerarias, Petunias, Verbenas, Chrysanthemums, Roses, Pentstemons, Carnations and Picotees in Pots; about 500 Dahlias, of the best varieties; two Beds of Tulips, and about 600 choice Pansies, all in beautiful condition.

May be viewed six days prior to the sale, and Catalogues had on the Premises or from the Auctioneer, 17, Princess-street. Sale to commence each day at eleven o'clock. Manchester, May 30, 1844.

GREENHOUSES—TO NURSERYMEN AND OTHERS.

TO BE SOLD, separately or altogether, THREE capital GREENHOUSES, in excellent condition; two measuring 40 feet front by 15½ feet deep; one measuring 27 feet front by 11 feet deep. Must be removed before the middle of June next. Apply to Mr. CRAIG, nurseryman, Montpelier-gardens, Walworth, Surrey.

TO BE LET, Furnished, for not less than Six Months, four miles from Hyde Park Corner, and near the river, a HOUSE possessing in an unusual degree the advantages of the country, with well-stocked Fruit and Flower-Garden, Meadow, Cow, and Poultry, Coach-house, Stabling, &c. The House contains three sitting and six bed-rooms, with convenient offices. For Floriculture, or kindred pursuits, it has qualifications rarely met with in a place of equal pretensions.—For particulars apply to Mr. MADDOX, 25, Welbeck-street.

FARM TO LET, on the Borders of Kent and Sussex, containing about 250 Acres of Arable, Meadow, and Pasture Land, of which 8 Acres are Hops in full plant. There is a very good Farm-house very pleasantly situated, ample substantial Buildings, and Five Cottages. The incoming at Michaelmas will be moderate.—Apply to Mr. Aitcheson, Groombridge, Tunbridge Wells.

HORTICULTURAL SOCIETY OF LONDON. EXHIBITIONS AT THE GARDEN.—The Second Meeting will take place on Saturday the 15th of June. The gates will be opened at One P.M. Tickets are issued to Fellows at this Office, price 5*s.* each; or at the Garden, in the afternoon of the days of Exhibition, at 7*s.* 6*d.* each; but only to orders from Fellows of the Society.

N.B. No Tickets will be issued in Regent Street on the day of Exhibition.—21, Regent Street.'

LYNDON'S PATENT GARDEN SPADES.—These excellent Spades, warranted to bear a knife edge, and wear as long as three Spades made in the usual way, are sold by JOHN SHEWEN, Ironmonger, Sevenoaks, to whom orders may be addressed, and will receive prompt attention.

The Gardeners' Chronicle.

COUNTRY SHOW.—TUESDAY, June 11—Gardeners' Benevolent Institution.

AT page 295, a correspondent, signing himself "Omikron," gave an account of a most destructive DISEASE AMONG HIS PEACH TREES, for which he could find no cure. Mr. Errington has since (p. 331) offered some valuable suggestions upon the subject. "Omikron" has furnished us with further information, and we now beg to submit a few observations of our own upon this singular case, which involves a variety of considerations of the greatest interest to gardeners.

The disease in question is "the gum" in a very aggravated state. Both young and old branches are cankering fast from this cause, and it is clear that all the trees in "Omikron's" garden must perish if the mischief is not stopped.

It appears from his statement that—1, the garden is near Cheltenham, in an open aspect, somewhat, but not very low; 2, the natural soil a clay, which by burning and cultivating has been made to work well; 3, the borders thoroughly drained, only a spit deep, and secured from communication with the clay by a cement bottom; 4, the soil of the borders a good virgin loam; 5, the trees planted with their roots near the surface. In all these circumstances there is nothing that can be objected to; the measures which have been taken are judicious; and it seems impossible that the mischief can be connected with them. Mr. Errington, indeed, refers the evil to the employment of loam on a cement bottom; and he thinks that chopped turf would have been better; which is true. But when we consider that the disease appears in a few weeks after trees begin to grow in this loam for the first time, that the borders are only a spit deep, the roots near the surface, and the drainage perfect, it seems difficult to believe that the loam is the real cause of "Omikron's" disasters.

Our own opinion was, as we stated at first, that all the evil arises from the wood not being properly ripened; and that opinion is changed into conviction by a second letter from "Omikron" now before us, accompanied by other specimens of the diseased trees. In all these the old wood is green, soft, and pithy; and he informs us that his gardener, a very observant and intelligent man, had made the same suggestion as ourselves, "from finding that the leaves remain on the branches until very late in the season, retaining their green appearance."

The great questions then are,—1, What is it that constitutes ripeness or unripeness of wood?—and 2, how are the agencies connected with the ripening process to be controlled? Neither of these questions can be answered without, in the first instance, examining the changes connected with Vegetable organisation.

Gum is the basis of vegetation; and he would not be very wrong who should assert that the whole framework of a plant is a skeleton of gum. This substance seems to be formed by the decomposition of carbonic acid amongst water, with whose elements the young carbon combines. The first secretion that we find in a young seedling is gum, and out of that gum the organs of the tender plant are fashioned by the vital force. The first secretion that is formed by a full-grown plant, when it is roused from its winter's torpor and begins to grow, is gum, which in trees oozes out between the wood and bark, as *cambium*, causing the latter to "run," and enabling both those parts to increase in thickness. Gum also lubricates the delicate organs which are formed in the leaf-bud, and lengthen into leaves and branches.

But as plants grow old gum disappears, the proportions of its elements change, and it assumes the new forms of starch and wood, or it simply loses the water that dissolved it, and becomes a hardened coating to the minute cells and tubes of vegetable structure. When it is completely changed, or hardened, wood is said to be ripe: on the contrary, when it remains in the very state of gum, and still retains its water, wood is called unripe. In the former condition it offers great resistance to changes of temperature, suffering but little from either heat or cold, and it gives birth to branches firm and healthy like itself, because they are fed by a healthy mother. In the latter state, (that of unripeness), it is extremely sensible of changes of temperature, its fluid expanding with force on either side of 40° of Fahrenheit's scale, and it brings forth sickly watery branches, because it cannot give them their duly prepared supply of food.

The point to be gained, then, is to secure the conversion of gum into some more dry and solid form of matter. This is the more important in a Peach-tree, because that plant, like all stone fruit trees, naturally produces gum in excess, and wants the power which many plants possess of rapidly converting it into something else. How is this to be done?

Gum is converted into starch or wood by the loss of a portion of the water in combination with it. A loss of 1 part of water in 11 produces starch, and of 3 parts in 11 produces wood. A separation of the water *of combination* is produced by heat and light, and by no other known agents. In proportion as the branches are heated and exposed to bright light are starch and wood formed at the expense of gum; we may also conceive that in a similar proportion unchanged gum is dried off by the evaporation of its water *of solution*, and *vice versâ*. Now, one of the first means to effect this end is to take care that no more wood is produced than can be fully exposed to sunlight; and that all such wood is continually nailed close to a wall, whenever it is long enough to be so secured, in order that the reflected heat of the wall may be absorbed by the branches. All the systems of leaving fore-right shoots, or of putting off summer pruning till the winter, and tucking in the summer growth, according to the ignorant school of Forsyth, are in the most direct opposition to the ripening process, or in other words, to the conversion of gum into starch and wood. This explains why Peach-trees grown in the open quarters of a nursery, where the temperature is low, are so peculiarly subject to gum.

But all the exposure, thin training, and other expedients that can be thought of, in order to place the Peach-tree in a situation similar to that of its own Persian climate, will fail, if the roots are permitted to suck up moisture too abundantly from the soil, or if the air is so damp as to hinder the ready passage of water through the leaves. In order, therefore, to secure the ripening of wood, these points also are to be sedulously attended to. The border must not only be at all times well drained, but in localities where the air is inevitably very moist, and where, therefore, the leaves are incapable of perspiring copiously, the border must be maintained so dry that but little moisture shall find its way into the system of the trees; for by so doing, the leaves, which have little power of action, in consequence of the dampness of the air that surrounds them, will have little occasion to exercise such power as they possess; and thus a due balance will be maintained between the perspiring powers of the leaves and the absorbing powers of the roots.

When these things are neglected, the consequence is that cold, expanding the watery matter of the unripe wood during winter, will force through the sides of the cells in which it is lodged the gummy fluid, which, the moment this happens, loses its vitality and causes a decay of the surrounding parts; or heat, when the sun beats fiercely on the branches, will produce the same effect—the inevitable result of which will be decay. The proximate cause of "the gum" may therefore be, either exposure of unripe wood to the sun, as we suggested (p. 295), or the action of frost upon it, as we observe by our correspondence that "Omikron's" gardener has supposed.

Another cause, distinct from all these, may be the following:—Suppose that neither heat nor cold are sufficient to damage the unripe wood, the new sap will do it; for in unripe wood the cells and vessels are filled unnaturally with crude fluid before the new sap enters them; and the moment that new sap is introduced in addition, they become so distended, that a portion of their contents must escape. That portion flows into the intercellular cavities of the bark, thence finds its way to the exterior, and having lost its vitality, immediately induces the decay of the surrounding parts. Cases like those of "Omikron" will be cured more certainly by reflecting upon these facts than by all the specific remedies which the most experienced plant-doctor could possibly prescribe. We commend them accordingly to all whom they concern—and their name is Legion.

FUCHSIAS.

(*Continued from p.* 316.)

THE general fitness of peat for Fuchsias, is in that state which approaches nearest to their conditions of growth in nature, namely, in a bed or clump in the open ground. Those who hitherto have not seen the surpassing vigour they assume when indulged with the cool and refreshing influence of this material, have yet to enjoy one of the most beautiful features of an English flower-garden.

The advantages connected with this mode of treatment are probably caused by the uniform moisture to which the roots are exposed, and which appears essential to their highest vigour. Under such conditions, the growth is nearly twice as great as when grown in the common borders; by being less exposed to the extremes of drought and moisture, their growth is much stronger, whilst the vigour thus acquired is ultimately productive of a proportionate amount of bloom. Under this mode of management is seen the practical application of a previous remark, viz., that the bloom of Fuchsias generally is commensurate with their annual extent of growth. Thus, their unrestricted vigour when grown in open beds of peat, not only maintains them in beauty for a longer period than when cultivated in pots, but also serves as a most valuable auxiliary in aid of the conservatory, greenhouse, &c., in the autumn months, it being a valuable feature of all plants which are adapted for planting out in peat, that their removal in bloom into pots or tubs may be effected at any period with infinitely less risk than similar plants grown in other soils. Hence the fitness of the present genus for shifting from the autumn situation into pots, &c.

Other advantages may be named. An established plant in a pot, on being planted out, will in many cases attain two and three times as much growth as it would under ordinary treatment (especially if the season is too far advanced for pot culture); hence its value to nurserymen, for the purposes of growth alone. It has also been shown that the bloom of Fuchsias in general is in proportion to the extent of annual growth; hence its value to amateurs, especially for late-flowering varieties. Last and not least, is its value for the object of increase. It is occasionally remarked, that a difficulty exists in propagating the Fuchsia during summer and autumn; and this remark is generally connected with another, which serves very well in the place of a worse, namely, that they are easily enough struck if cuttings can be got in a proper state. The question then is, How may suitable cuttings be obtained under the most unfavourable circumstances, or during that season which is the least adapted to produce them under ordinary modes of culture?

At page 753 (*Chronicle*, 1843), an opinion is offered, that "the vigour of plants is in proportion to the excitability of their organs." Admitting this to be correct, it is further assumed that any system of cultivation which insures a progressive and accumulative secretion of sap, by an uninterrupted supply of the agencies which are essential to growth, is alone productive of the highest vigour at any given period. As such, it follows that all plants whose maturity of growth and bloom has been produced with the least artificial restriction of those agencies, embody a higher amount of constitutional vigour than those obtained *vice versâ*. For example, a Fuchsia plant, subjected to a uniform circulation of moisture, by being planted in a bed of peat, which is the closest approach to its conditions of growth in nature, will possess a higher amount of vigour, for growth and for bloom, than any similar plant which is exposed to the alternations of drought and moisture in a pot. Again, the finest specimen of Fuchsia in a pot would be that wherein the entire growth was rendered subservient to the ultimate effect of bloom; an effect which it produced at the sacrifice, in part, of the natural size of every organ, and generally by a reduction of the highest known vigour of the plant. But the most perfect specimen of Fuchsia, by open ground culture in peat, would never so far either reduce the proportions of its several parts, nor render the plant incapable of forming additional leaf-buds. The general inferences to be derived from these remarks are, 1st. That an approach to the conditions of growth in nature, are capable of higher effects than the conditions of growth by art; 2d. That those conditions which maintain a progressive excitability of the organs, also involve the primary and essential condition of their multiplication by cuttings. Thus, one of the most valuable results of Fuchsias being cultivated in beds of peat is, that the excitability of the plants to a late period offers a state of growth suited for propagation throughout the year.

About seven years ago, the writer had two new varieties intrusted to his care for increase. The plants being in full bloom when received, were in an unsuitable state for the purpose. After removing all the bloom from one of them, it was planted out in peat, where it resumed its growth until October, during which period it yielded a sufficient number of excitable fore and lateral shoots for two store pots of cuttings, which were plunged in a small tan-pit with a very slight heat, and covered with bell-glasses. They were kept in a moist state by sprinkling water over them with the hand, or a fine rose watering-pot. In a few weeks the whole of them began to emit roots from the axils or leaf-buds, and for a considerable period before spring, roots were emitted from every part of each, even up to the terminal leaf; and though the whole of them were afterwards left to perish by exposure in an open frame, the instance is still remembered as one of the most interesting facts in the writer's practice. Plants of one year's growth, when pruned and previously started into growth in a cold pit, are well adapted for the centre, and plants of the current year are suitable for the fore-ground of a peat-bed. If it is fully exposed to the sun, occasional syringing with water will be found beneficial. The principal precautions in the autumn shifting into pots, are to secure each plant firmly to a stake, and its removal to a pot large in proportion to its size. In potting, very little bottom drainage will be required, because the vigour of the plants demands an abundant supply of moisture. If the operation is performed on a wet day so much the better; if not, let the plants be placed in a close shady place for a few days, each in a dish or pan which may be allowed to retain the superfluous water

Syringe gently each day, and the continued beauty of the plants will more than repay the attention.

The above directions are equally applicable to plants of Salvia, &c., for the purpose of giving additional effect to a conservatory when plants are wanted to harmonise with Chrysanthemums, &c. — *W. Wood, Pine-apple Place.*

FAMILIAR BOTANY.

MORPHOLOGY.—No. XIV.

Would you, then, learn to dissipate the band
Of these huge threatening difficulties dire,
That in the weak man's way like lions stand,
His soul appal, and damp his rising fire?
Resolve, resolve, and to be men aspire.
Let godlike Reason, from her sovereign throne,
Speak the commanding word—I will!—and it is done.

ALTHOUGH there are many unbelievers in the change of leaves into petals, there are few who doubt that stamens may be transformed into petals. And how, indeed, can it be otherwise when one has once nestled one's nose in a fine, sweet, soft double Rose; or stood admiringly over a bed of Ranunculuses? For we know that the middle of a wild Rose, or Ranunculus, is filled up with stamens, and that when such flowers become double, the disappearance of stamens is always in proportion to the appearance of petals.

But although this familiar fact has the effect of making the change of stamens into petals seem a very possible event, yet, in truth, it is a far more surprising thing than the change of leaves into petals; because there is an entirely new sort of organisation introduced with the change. Let us see how this happens.

If we examine the white Water Lily we find so gradual a passage of sepals into petals, that it is hard to say where the former end and the latter begin. However, at last we come to what are evidently petals, viz., the thin, flat, white, shining plates which form the brilliant rays of that most lovely flower. Now, if we pull away these petals, we shall find them alter as they approach the centre of the flower. They become narrower, smaller, and thicker, till at last their points assume a new form, and become yellow on each side. By degrees these altered petals become very narrow straps; by similar degrees the yellow sides near the end become thicker and larger; and at last we find that they are the seat of pollen—a perfect anther being formed. The sides of the petal near the end have secreted the yellow powder in their inside, and at last they split and allow it to escape. In this instance, in the natural state of things, the formation of stamens out of petals is so very gradual that plenty of instances occur which are neither the one nor the other. The same sort of transitions, but in a less degree, are observable in the Calycanthus.

When flowers become double the reverse of all this takes place. In the common China Rose the filaments become broad and thin, and acquire colour; at the same time the anthers shrink up; and by degrees, the latter having wholly disappeared, the usual condition of the petals is gained. In this, which is called retrograde metamorphosis, very instructive cases of intermediate structure are everywhere observable. Sometimes a stamen is half changed, and then a half anther is found on one side, while the other is expanded into the thin texture of the petal. Sometimes the anther seems to struggle with the filament for mastery, and resolutely maintains its ground at the point, while the filament as resolutely expands and reddens, till at last it rises above the anther on each side, as if to smother that which it cannot otherwise destroy.

Examples of this kind are endless; the Hawthorn, the Cherry, the Pæony, Anemone, and Ranunculus, are full of instructive information; not, however, such plants as the Dahlia, which, although called double, owe their doubleness to a cause entirely different from the transformation of stamens into petals.

The progress of growth proves all this still better than the transitions that have been pointed out; but it is difficult to observe. The most accurate observation shows that when a flower is very young, the petals and stamens are little scales, differing from each other in no perceptible degree; but after a certain period those scales take different roads to their final organisation. The petal-scales are continually expanding, and thinning, and acquiring colour; but the stamen-scales seem influenced by some power of contraction that is incessantly acting upon their growth; they get no colour, but expend their vitality in the conversion of a part of the cells of their interior into pollen. This has been observed even in the Lupine, whose stamens and petals are among the most unlike that could be easily found.

The stamens, then, are transformed from petals, the petals from sepals, the sepals from bracts, the bracts from leaves; and therefore the stamens are also transformed from leaves.

Our next consideration will be the way in which the fruit is made from leaves.—*R. E.*

ENTOMOLOGY.

ONISCUS ASELLUS, AND ARMADILLO VULGARIS; called in England, *Wood-lice*, *Millipedes*, *Pigs'-lice*, *Sow-bugs*, *Old-sows*, and *Carpenters*; and in Scotland *Slaters*.—Cucumbers and Melons in frames are subject to the attacks of various insects, &c., which by perforating or otherwise injuring the leaves, render them unfit for the elaboration of the sap, and consequently the size and flavour of the fruit are greatly injured. Wood-lice, the Thrips, Aphis, Acari, and a minute Hister, are mentioned amongst the aggressors; and as the first are often complained of as a serious pest, we will now undertake to give their history. There are, it will be found, two sorts that inhabit gardens, which although confounded by many persons are very easily distinguished—one species rolling itself up into a compact ball when touched, and being more convex than the other; indeed they are sufficiently dissimilar to have been formed into two genera, one having eight-jointed, the other seven-jointed antennæ, but I have seen the young of the following species wanting the two end joints of the antennæ, and I believe also one pair of legs.

Oniscus asellus of Linnæus, named by Fabricius O. murarius (fig. 1), does not roll itself into a ball when at rest, and the antennæ are composed of eight joints, the fourth being almost as long as the fifth, the terminal one producing a short bristle; the body is oval and but slightly convex; it is composed of 14 visible segments, including the head, which is broad, with a distinct tubercle on each side before the eyes, which are small, black, and coarsely granulated; the tail is furnished with four styles and a central spine, the two outer ones biarticulated. This species, when young, is sometimes red, or of a lead colour; but when full grown, it is of a yellowish-white; the upper side is rather rough or warty, variegated with brown or lead colour; the antennæ are longish, angular, and pubescent towards the extremity; the two basal joints only are whitish; the head is entirely of a lead colour; the sides of the segments are dilated and acutely serrated; the back is dark, variegated with yellowish spots, leaving the lateral margins whitish; seven of the segments have a large dark spot on each, forming a line of yellowish ones down either side; the legs, of which there are seven pairs, are 5-jointed, beautifully ciliated internally, and terminated by a claw (fig. 2).

This Myriapode principally inhabits chinks in old walls, rotten wood, and dung-hills, and is reported as the most destructive species in the Cucumber, Melon, and Mushroom-frames, and will feed off, in a very short time, a young crop growing near walls, such as scarlet Beans and Peas; the old plants they materially injure by gnawing off the bark. In wet seasons they become very mischievous amongst wall-fruit.

Armadillo vulgaris of Latreille, the Oniscus Armadillo of Linnæus (fig. 3), rolls itself up into a ball when touched, concealing its legs and antennæ; the latter are not long, but pubescent towards the apex, and seven-jointed, the fifth joint twice as long as the fourth; the apex is furnished with a minute bristle (fig. 2); the body is elliptical, very convex, being semicylindrical, and composed of 14 segments; the head is very broad, with a minute eye on each side, coarsely granulated; the tail is not prominent, and the lateral appendages are short and broad; it is of a deep lead colour, and the upper side is punctured; the sides of the segments are not dilated, but droop below the abdomen, and they are obtusely serrated; it has seven pair of legs, which are six-jointed, the 3d, 4th, and 5th joints being shaggy on the inside; the sixth joint is small, and terminated by a minute claw (fig. 5). *Obs.*—Figures 1 and 2 in the cut are rather larger than specimens are usually found. This species is sometimes called the Pill-Millipede, and was formerly employed in medicine to cure agues, consumption, &c.: it inhabits moss and the base of walls; it is likewise found under stones, rubbish, &c. I am not certain that it is not equally as destructive as the Oniscus asellus.

The eggs are first deposited in an oval bag beneath the abdomen of the Wood-lice, and when they are hatched the mouth of the pouch is opened for the young brood to sally forth, and as soon as they have scrambled off, the mother closes it again. The young are brought forth towards the end of summer; and it seems they have only 12 legs at first; but after several moultings they attain another pair; this succession of skins may account for the variation of colour so often perceptible, as well as for their different sizes. When they have just cast off their horny coats of mail they are white and soft, but occasionally I have found a brood of a brick-red colour. The Onisci walk slowly unless disturbed, when they run fast away; they shun the light and heat of the sun, and therefore are seldom visible by day; they not only feed on plants, but on the juices of animals, and will even devour one another when confined without food.

I believe that neither lime, soot, nor the fumes of sulphur will expel the Wood-lice from frames, unless the latter be applied to an extent which would injure, if not kill the plants; for some by burying themselves in the earth, and others possibly by rolling themselves up, would remain secure during a severe fumigation. I have not long since stated that a toad, the Rana Bufo of Linnæus, if kept in a frame will soon exterminate Wood-lice, Ants, &c.; *but a pan of water should be put in with the animal.* Large quantities may also be caught by placing two tiles or boards over each other, between which they will crawl as the dawn of morning approaches, to conceal themselves; and tiles laid over old Cabbage-leaves form excellent traps.—*Ruricola.*

THE ROSE-GARDEN.—No. X.

(*Continued from page* 332.)

Insertion of Bud.—On the upper part of the shoot of this year, as close as possible to the stock, say, to touch it within the eighth of an inch at its base, make an incision one inch and a half long, in the direction of the length of the shoot, quite (but no more) through to the wood; above that at right angles make a cross cut about 2-5ths the circumference of the shoot, or rather say, wide enough to admit the shield freely. This is of the greatest importance, as the shield would otherwise be raised up in the middle, instead of lying in contact with the wood below it, and the bud, being thus deprived of the sap from the stock, would ultimately perish. In unskilful hands multitudes of buds fail from this cause, both in the time of budding and at subsequent periods.

When the shoot is not ripe, the chance of its being broken off by the wind is much lessened by making the longitudinal incision of a greater length than usual, and omitting the transverse cuts. The difficulty in inserting the bud is but slightly increased, and the success quite as certain. Proceed, then, to prepare the shield as before directed; which done, for convenience sake place the upper end of the shield, (but only the tip of it,) between the lips, then loosen the sides of the bark, within the dotted lines, turning down, as it were, the corners of the bark at the top, with the ivory end of the budding-knife; this must be done without injury to the bark, and clean to the wood, and no difficulty whatever must occur in separating the bark from the wood; if there be, the sap is not active, and the bud inserted would perish. Slip in the shield to the bottom of the incision, and then cut off the piece of bark which was between the lips, even with the cross cut, so as to place the shield in exactly the same position as the bark which now overlays it formerly occupied. The bud is now in the centre of the incision, and in that position is less likely to be injured by wind, when it pushes, as well as more convenient to bind over, than if it were at the extreme point. The first junction takes place at the cross cut, by the sap, in its descent; care must therefore be taken that the shield fits exactly at that place. The shortest possible time should elapse pending these operations, lest the lips of the covering bark or the bud, should get dried; and for this reason, as before mentioned, a dull growing day is far preferable to a windy one, as evaporation is the death of the bud, which, like all cuttings from the mother plant, succeeds best when unexposed to the air.

Some disappointment will at this time be experienced, by the operator finding that the bark of several of his plants, so far from slipping, will not appear to be even plump; and if any attempt be made to move it, by cutting across as usual, the shoot breaks off in his hand, and proves to be little more than pith. Habit alone enables the eye to see at once, from the apparent vigour of the shoot, if it be in a fit state to be worked, and saves the trouble of useless experiments. When a plant is found to be in a stagnated state at the beginning of August, it rarely becomes fit to receive a bud during the current season, and the shoot or shoots upon it should be shortened to six, eight, or ten inches, according to their strength, that the whole vigour of the plant, which was before applied to the entire shoots, may be confined to narrower limits, and the buds, thus left breaking out, will continue to draw up the sap, and maintain all the action the root can afford. Any experiment on such plants during the current season will almost always prove a waste of time, but the ensuing spring will in all probability infuse fresh vigour, and fit the plant either to receive a scion, to take a bud at the base of the shoot left the preceding autumn, (the natural buds upon which should be left at liberty to break,) or if the head be removed, start new and more vigorous shoots fitter for the same purpose. The cause of the defalcation of the plant, arises from its having expended all its vigour in its spring shoots, and having few or no fibrous roots, or their action having been weakened by the soil not being sufficiently light or properly pulverised when the plant was put into the ground, the growth of the stem and branches is suspended, though the root may be slowly increasing. The older the plant, (beyond a certain age,) the more liable it is to this failure, which is sometimes temporary, sometimes total, and generally happens to a proportion of the plants prepared for use, which, it must be remembered, have not received the advantages possessed by other young stocks, being in general much more maimed on their first removal. The best preventives to the inconveniences above mentioned, are early planting, keeping the stocks as short a time as possible out of the ground, taking care that the roots and fibres are extended horizontally, being neither deep enough in the earth to prevent the effects of the sun, nor so near the surface as to be exposed to be too much dried up by it; that they are well covered with a rich, light, well-pulverised soil, and the plants themselves are placed in an open and airy situation, exposed to the meridian sun.

Binding up.—Have a handful of fine bast soaking in water ready at hand, and the moment the insertion is complete in the individual plant before you, place the middle of the bast behind the shoot at the bottom of the incision, and bring the ends across and across each other, back and fore, covering the shoot, all but the bud, which must be left peeping out, unconfined. Continue the crossing till it reaches a little above the bud, and then tie the top in a knot behind; if tied in front, the knot holds the rain, and keeps a drip upon the bud, besides pressing upon the bark, and indenting it there, stopping, to a degree, the current of the sap. The ligature should be as tight as could be borne for a short space of time upon the finger.

A Laurel leaf may be lightly tied to the shoot at both ends of the leaf, so as to form an arch over the bud, to defend it from the sun and rain, both of which are as prejudicial as the air.

Success.—It must be remembered, that final success depends upon the entire exclusion of sun, air, and wet; the shaking of the bud from its position when once fixed in it; continuation of the sap; and the fitness of the shoot and bud to each other—which latter is known by the facility with which each bark strips from its wood.

It will be well to make a few experiments upon a branch of Willow beforehand, which, from its natural succulence, will convey to the operator a distinct idea of the facility he should experience in the separation of the bark, of both shield and subject, subsequently under his hands.

AN AMATEUR'S MELONRY.

Your imprimatur having been given (page 295) to my simple mode of raising Melons by the heat of stable-dung, it may not be amiss to tell those of your readers, who may be disposed to imitate my pit and mode of culture, how they may improve upon the one and avoid the errors of the other; that is to say, the errors which amateurs fall into from want of practice, even with the best written instructions before them. They who have access to, and are in the vicinity of gardens where the fruit is successfully cultivated, will do well to take practical lessons there; but such opportunities are by no means frequent; for, as far as my experience goes and inquiries extend, I am led to believe that in proportion to the pains bestowed upon it, this department of the garden is generally less creditably and profitably conducted than almost any other.

The pit I have described has been in existence some years, and answers my purpose, but if it were now to be constructed, I would (as I before said) put it down in a quadrangular shape, for the better concentration of warmth. I would also make the beds at least seven feet wide; five is much too narrow for strong and healthy plants of the grosser growing kinds; more than seven would make the lights too unwieldly for an amateur's cultivation, unless with a strong labourer at his elbow. There should be about as many cubic feet of dung in the lining spaces as there are cubic feet of frame; but less will do if a fresh supply of material is always at hand.

In the early stages of growth the bottom-heat should not exceed 75°. In consequence of the almost uninterrupted sunshine of the April just past, I was obliged to have my linings partially removed (a thing never before done) to keep down the bottom-heat; this is better than shading. It is not necessary to use the mats in the daytime; if the plants are inured to sunshine from the beginning, they cannot have too much of that after they are well-rooted, air being at the same time freely admitted; but I agree with Mills, that it is well to cover up well at night from first to last.

Water should be liberally supplied, but not without being warmed up to or near the temperature of the earth of the bed. No doubt the waters of the rivers and lakes of Persia or Asia Minor are in the Melon season never much colder when led off for irrigation than the soil in which the Melons are grown.

When the fruit is setting, the bottom-heat, assisted by sunshine, should rise to 80° degrees and 85°; and as it advances in growth, no sun-heat (plenty of air being given) can be too much. If sunshine is wanting, the linings should be turned and freshened, to make up for the deficiency.

In regard to stopping and pruning, I have nothing to add to the ordinary directions given in books. You cannot have good fruit without active growth and strong foliage, and therefore you must prune early and freely, and still follow the directions of "the Bard," and

"Give ample space and room enough."

I have raised Melons under calico, made waterproof with wax and linseed-oil. But the great annoyance was the quick growth of mould on the under surface of such covers. If this evil is not obviated by Whitney's Composition, I apprise all Melon-growers that they had better be at the expense of glass at once.—*P. P.*

Home Correspondence.

Spot on the Pelargonium.—I am a great admirer and a pretty extensive grower of this plant, and in common with others am much interested about the cause and prevention of the spotting of the leaves, which latterly seems to have become so prevalent. After a careful perusal of all that appeared in last year's *Chronicle*, in reference to this disease, my observations lead me to differ considerably in opinion as to its cause from anything there expressed. Some ascribe it to cold, others to bad soil, and others again to the attacks of insects. Though I would not assert positively what is the cause, yet I am exceedingly doubtful about its arising from any of these; at least with me it assuredly does not. The whole of my observations during the last two seasons tend to prove that it originates, not from cold, nor soil, nor insects—from none of these individually or collectively—but from sudden alternations of moisture and drought in the soil, in combination with full exposure to the scorching sun. The following are the facts from which I derive this opinion:—In this place we cultivate upwards of 2000 Pelargoniums in pots; one house—a lean-to, having a nearly due south aspect, and fitted up with an ordinary stage, not more than three feet from the glass—is exclusively set apart for their culture. In this house the disease is very prevalent, every plant being less or more affected by it; those on the top shelves, however, are by far the worst, where they are most exposed to clear sunlight and drought, and the spotting gradually becoming less as the shelves descend, where, from their position, the plants are somewhat cooler, and where, from their having lost fewer leaves, they are of a more bushy habit, and consequently afford considerable protection to the pots from drought and clear sunlight. In the same house, next the front glass, is a horizontal trellis or table for setting plants on, two and a half feet wide, and extending along the whole length, and along both ends of the house. The plants on this table receiving their light chiefly through the perpendicular front glass, get the sun's rays much more obliquely than those on the stage (the angle of which nearly corresponds with that of the roof), and their leaves are also much less spotted. The plants in this house were much affected by the disease last season, up to the end of May, when they began to bloom; they were then shaded every clear day, from ten o'clock a.m. to five p.m., by a light canvass covering over the roof; the house was also kept cooler by shading and admission of plenty of air, and the disease disappeared. In a late vinery joining this house there are at present about 300 Pelargonium plants; these receive a good deal of shade from the Vines, and very little spotting is to be found among them. The plants in both houses are of the same age; they were all shifted at the same time, and in exactly the same kind of mould. The temperature of the vinery, up to the present time, has not been higher than that of the Pelargonium-house; the only point of difference is the shading by the Vine-leaves, and to this I attribute the almost total absence of the disease among the plants in the former house. I am farther confirmed in this opinion by the state of the Pelargoniums in another house—a large circular conservatory, where they have considerable shade from other large plants, and also from the structure of the house. There is little spotting among the plants here, and on the dark side, where the greatest shade prevails, there is no spotting at all. The soil in this case is the same as in the others, but the temperature is much lower than in either of the other houses. Again, in a flat leaden and, consequently, perfectly dark-roofed orangery, the only light of which is derived from ten large upright windows, five on each side, I have never seen any spotting on the leaves of the Pelargoniums, which are entirely shaded by other large plants. The light, indeed, in this house is far too little for the health of almost any plant, if allowed to stand long in it; at the same time the temperature is greatly cooler than in the three last mentioned houses; nevertheless, Pelargoniums immediately begin to recover when placed in this house, from the spotting on the leaves, though much injured by it at the time of their being brought to it. Last June I had between 600 and 700 young Pelargonium plants, chiefly cuttings of the previous August, which, being unable to accommodate in any house, pit, or frame, I was obliged to put out in the open air. They were shifted into larger pots, and plunged up to the rims in two beds of sawdust, in a sheltered situation. One of these beds was fully exposed to the sun from morning to night; the other, being situated on the east side of a high wall, was shaded in the afternoon. The plants in both beds grew luxuriantly till their roots filled the pots, and although they were plunged, the mould in the pots frequently got very dry. About the middle of July the leaves of the greater number of the plants became spotted; those occupying the bed fully exposed to the sun were, however, much worse than those in the other, which was partially shaded by the wall. The soil and every other condition (excepting the shading) was, in both cases, exactly alike. When I cut down my plants after they have flowered, I generally put them into a spare melon-frame to start them again. In this case the disease has always been worst, so much so that many plants have died. I have not observed any spotting on the leaves of some hundreds of Pelargoniums planted in the flower-beds and borders. What, then, is the inevitable conclusion deducible from these facts? Clearly that cold does not produce the spotting of the leaves, for my warmest houses are the worst, and the coolest have none at all. Neither can it be soil alone, for in every case the soil with me was the same. If it is insects, it would appear they can do mischief only in clear sunshine, and shading will banish them. From what I have observed in reference to this disease, I imagine that it must be caused in some way or other from the roots of the plants, and the soil in the pots being powerfully affected by drought and moisture in alternation, through exposure to the strong sun-heat.—*A Connaught Gardener.*

Strawberries.—On the 26th inst. I gathered from the open ground a perfectly ripe Strawberry, (a Grove-end Scarlet,) and the day following a ripe Keen's Seedling. I state this, not so much to show the forwardness of the season, (having gathered a fully matured Grove-end Scarlet on the 19th of May, in a year not long past), as to induce Strawberry-growers, in different parts of the country, to name the time of gathering their first ripe fruit, and thus furnish data for judging how far the climate of one locality differs from that of another. I must not neglect, however, to say that the Scarlet was from a low steep bank, faced with rubble stone, and the Keen's Seedling from a higher bank, faced with the same material; but, being intended for the branches of fruit-trees only, there is only subsoil beneath the stone surface, the joints of which were dashed with mortar, to prevent weeds from springing up, but not so effectually, it appears, as to prevent Strawberry-runners from rooting. I may add that both berries were of the average size of their respective kinds. Runners of the British Queen did not take root in my garden last year, and I observe that some of the two-year-old plants are dead. It is to be feared that this variety must be classed with Wilmot's Superb and Myatt's Pine, neither of which are profitable Strawberries. Swainston's Seedling has proved itself a valuable sort, being hardy, prolific, of good flavour, and ripening its fruit after Keen's Seedling, but before the Elton, another valuable kind.—*Richard Tongue, Forton Cottage, near Lancaster.*

Auriculas.—I have been for many years a successful cultivator of Auriculas, and as this is the season of seeding, I beg to mention a method I have adopted of procuring seed, without the least injury to the most valuable plants. While the flowers are in high bloom, I remove and exchange the pollen through all the trusses of blossom on the stage, with the point of a pen-knife. I leave them until they begin to decline, then I cut off the stalks. Having ready some fine sea-sand, in a vessel that will not admit of leakage, I stick down those stalks rather low, and keep the sand always moist. I leave my vessel of stalks on the stage until the seed is ripe. I always have sowed Auricula seed in September, and never had a failure. If any of your readers will try my method I imagine that they will find it succeed. I am sure the cutting off the trusses before they are decayed benefits the plants, and does not in the least injure the seed, which ripens quite as well in the moist sea-sand as on the plant; it was finding this plan succeed so well with Pansies that induced me to try it with Auriculas. I have had some very fine green-edged seedlings blow this season that have sprung from seed saved in the above manner. I should be glad to learn if my plan has been used by other Auricula growers.—*Elizabeth.*

Root Excretions.—In a late *Chronicle* there are some observations of Liebig on the Chemistry of Cultivation (extracted from the "Chemist"), which have suggested to me a question on the subject of the Excretions of Plants, which I do not think has met with much attention hitherto. It is, I believe, a well-ascertained fact that the composition of all plants of the same species is nearly the same, even though they may have been produced by soils differing in constitution and quality. It is also ascertained that plants have not the power of refusing any substance that may be presented to them in such a state of solution as to be absorbable by their roots. If these premises are correct, it follows that plants must, in some manner, get rid of those absorbed matters which do not enter into their natural composition. The question I would ask, therefore is, How is this effected? Any organic substances, not required by a plant, may perhaps be disposed of by evaporation, but how are the inorganic ones got rid of? To explain this, it appears to me necessary to adopt the theory of excretion by the roots. Perhaps some of the readers of the *Chronicle* will favour us with their views on this subject, to which I have thus briefly endeavoured to direct their attention.—*Dendrophilus, Roxburghshire.* [The best answer to this is, that the most carefully conducted *experiments* show that the excretions in question do not take place.]

Swans.—In a late Number, Mr. Forsyth, speaking of swans, seems to imagine that they will keep lakes and rivers free from weeds, toads, and frogs. When the lakes, &c. are small, that opinion may be correct; but when they are large, and the water shallow, weeds will grow, and toads and frogs will enjoy many a quiet corner amongst them, independently of the swans. There is proof of this where I reside. Mr. F. complains of pinioning swans' wings; but, without doing this, how are the swans to be kept, especially in small ponds—would they not "take the wings of the morning?" When that operation is well performed, the noble bird is not much disfigured; and with regard to cruelty, the same may be said of many other operations that are performed for useful ends. Mr. F. quotes from Langton the story of St. Patrick banishing snakes and toads from Ireland, which is a very popular notion. As the story goes, the frogs were spared, but toads shared the fate of snakes, because they were venomous. Toads are, however, as harmless as frogs, and perhaps more useful, for they frequent cultivated lands more than their yellow neighbours, and destroy more insects that are injurious to vegetation. Lately, I was told by a friend that he once accidentally trod upon a toad on a path in a Corn-field, and that he found 16 fresh beetles in its stomach. These, probably, the patient toad had snapped up while they attempted to cross the path. Respecting toads being introduced into Ireland, it has been said that they would not live; also, that there is something in the soil injurious to them. But I question if ever the thing was properly tested, for there is such a near connection between toads and frogs, that what would be injurious to the one, must, in a great degree, be injurious to the other. In this country, toads

are found in all kinds of places, from the quagmire to the dry land—nay, at times, in the heart of trees, and even solid rock. This would lead one to suppose that the two reptiles never were together in Ireland. Toads are often kept with advantage in hot-beds, for killing insects in this country, and they would, no doubt, be useful for the same purpose in Ireland. With regard to snakes, I may observe that wet boggy land, like many parts of Ireland, does not suit that reptile. Some writers doubt whether the snake gives chace to its prey: but it certainly does. A gentleman, on whom I can rely, informed me that he once saw a snake in pursuit of a frog, and that it swam across a river after it. There has been a story like that of St. Patrick banishing the snakes and toads from Ireland, in the island of Malta, ever since the viper fixed on the hand of St. Paul.—*J. Wighton.* [Toads are perhaps among the most humble of a Gardener's friends; but certainly none are more really useful.]

Guano a Preservative of Flowers.—Those who are lovers of flowers, and delight in having them constantly in their rooms, may continue to keep them fresh for a very considerable time, by putting into the water a pinch of Peruvian guano, which is rendered immediately soluble and taken up by the cuttings. Guano is essentially different from all other manures: it possesses most of the constituents of plants, and contains a great portion of salt and other antiseptic, and yet the most fertilising ingredients.—*J. R., Woolwich.*

The Potato.—The reading of some articles upon the Potato, that have lately appeared in the *Chronicle*, has called to my recollection a circumstance respecting the culture of that important root. Between the years 1795 and 1799, whilst I was at Cluney, in Aberdeenshire, it was the practice there to pull up all shoots but one from the sets, when they were from four to six inches above the soil. As soon as the blossoms made their appearance they were also invariably picked off, for the gardeners had long been aware that both those practices added much to the increase of the crop; and I have since proved that it certainly does. From the result of experiments in various ways with different manures, I am perfectly satisfied that the too common practice of applying recently made manures in immediate contact with the sets is a bad one. In such a dry season as this has been, where the sets have been placed upon the top instead of beneath the manure, it will prove destructive to a very large portion of the sets in light lands; but a simple remedy is at hand, for if those extra shoots which are at most of the sets that have freely vegetated, are carefully planted by the hand, in a coiling form, leaving only the top of the shoot above the soil, they will grow and produce tubers in abundance. At the proper time to divest the set of the superabundant shoots, the plants will all have got so well rooted, that they will stand no longer in need of the assistance of the sets: so that if the whole of the shoots are taken up, and coiled singly in the place where the sets were, a better crop will be produced than if a single shoot was left after it was separated from its neighbours. For an early crop, on a small scale, I strongly recommend raising the plants first in frames, or in a warm border. They should be thickly planted, so as not to take up ground unnecessarily, and when the shoots are from four to six inches high, shake the plants carefully out with a fork, so as not to injure the young roots, and then plant them according to the coiling system. They are best planted in very shallow trenches, if the subsoil is dry, and they should be earthed up by levelling the ground. This is an old practice, that has long gone out of use; as well as that excellent one of using tolerably well decomposed dung, dug or ploughed in, and well diffused in the soil before planting. The coiling of the shoots in a horizontal position causes roots to be freely emitted at all the buried joints, and likewise fine tubers; but there are many varieties that do this much more freely than others; as may be observed even when the shoots are above the soil, when the plants are shaded and kept damp.—*John Mearns, F.H.S.*

Rosa Sulphurea.—I beg to inclose a bloom of the old double yellow Rose (Rosa sulphurea), which is rarely seen to flower well in English gardens. I imagine that my success in this case is mainly owing to judicious finger-pruning and the use of Humphreys's Inodorous Soluble Compound, dissolved in soft water, and applied to the roots as occasion required. This tree has not flowered before, although Busbridge used to be famous for yellow Roses. I have flowered Rosea sulphurea some years back in Northamptonshire (see *Gardeners' Chronicle* for 1841), in a different soil and aspect from this; therefore my experience leads me to infer that much depends on finger-pruning and the free application of stimulants during the growing season, particularly from the time the flower-buds appear until they burst into beauty. The plant here is in a south-west aspect; the soil is a sandy loam; the gardens are in a sheltered valley, contiguous to large sheets of water. The Rose sent is an average-sized specimen from among many flowers that are now open on the same plant. I have no doubt that by paying the same attention to the constitution of the plant in future seasons, I may again have a beautiful show of this delightful novelty.—*Henry Bowers, Busbridge Hall, Godalming, Surrey.*

Chicory.—In a late Number you appear to consider that the well-known excellence of French-made Coffee is owing, in a great measure, to their mixing Chicory with it. This, however, is a mistake; great pains are, on the contrary, taken by all amateurs of Coffee in France, and in all private houses as well as *Cafés* celebrated for the excellence of this beverage, that it should be quite pure, without the admixture of any foreign substance. The good quality depends on the selection of the raw Coffee, on the way in which it is roasted, on its being fresh roasted as well as fresh ground, and on the actual mode of preparation; and to secure the above properties, and to provide against adulteration, most private families buy their Coffee raw, roast it very frequently, even every day, and grind it immediately before it is made. Chicory is, however, a great deal used in France, sometimes and perhaps generally for mixing with Coffee which is sold ready roasted and ground, and very frequently to make up a beverage similar to Coffee, but with a different flavour, which is preferred by some, especially by those who fear the effect of Coffee upon their nerves, or who adopt the Chicory from motives of economy. Chicory, as a cheap substitute for Coffee, has also been long in use in Sweden and other northern countries.—*E. M.*

Chicory.—On the question of adding Chicory to Coffee, allow me to send you the following. An intelligent Tea-dealer told me the other day that a few years ago, he conscientiously gave up the addition of Chicory to the ground Coffee which he sold in his shop. At this time he had a large trade in retail Coffee, but it gradually fell off from year to year, without his being able to assign any cause. In vain did he sell his Coffee below a remunerating price, in the hope of getting up his trade. He at last found out that the great difference between his own and his neighbours' Coffee was that they added Chicory, and he did not; and he resolved on adding Chicory once more. From this time, his sale of Coffee improved; and he now considers it equivalent to the other branches of his trade. How it is that Chicory improves Coffee is a curious question in dietetics, and there is probably something more in it than mere flavour. But at any rate it is improved, as I think "Anti-Adulteration" will allow, if he orders a cup of Coffee with, and another without, Chicory, and tastes them. Can any of your correspondents inform me if Chicory has been analysed? Does it possess an alkaloid? These questions have become of interest since it has been pointed out that the alkaloid of Coffee (caffeine) and the alkaloid of Tea (theine) are identical in composition. It has also been recently stated that the alkaloid of the Ilex Paraguensis, which affords the Paraguay Tea, is identical with caffeine and theine. In connection with the theory of the use of this principle in the animal economy, propounded by Liebig, and which I am not at all disposed to reject as hypothetical, this branch of inquiry is very interesting. The Ilex aquifolium contains an alkaloid; has this a composition similar to the above? Inquiries of this kind may lead to important discoveries, and plants possessing all the essentials for use, of those which we obtain from a distance, may be growing at our own doors. The leaves of the Elm, Sloe, &c. were extensively used a short time since as British Herb Tea, and the sale of it forbidden by the government, because it was supposed to be used for aduiterating Tea. There would be no objection to selling Elm-leaves and Sloe-leaves as such, and why should they not contain principles contributing as much to the health of the body as the Chinese Tea-plant? The action of the vegetable alkaloids on the animal economy, is an obscure but interesting question. In medicine they are used, and with decided success, and the successful administration of medicines in most instances depends on supplying the system with principles which it has failed, from some cause or another, to obtain from its food.—*L. E.*

Woodlice.—I observed in the *Chronicle* that these were destroyed by laying down cut Potatoes. Being very much infested by them, and the method being simple, I tried it; but at the same time I imagined that there might be some better way of getting rid of them. I accordingly laid down along with the Potatoes a few Swedish Turnips, cut in two or three parts, according to their size, in order to ascertain whether the Potatoes or the Turnips would answer the purpose best. For the first few days there was no difference between the two; but as soon as the Turnips had got soft, then the woodlice began to be most numerous on them; and now they have almost left the Potato altogether. The longer the Turnips lie the fonder they are of them. As it is at the warmest end of a house that the woodlice are most numerous, the Turnips should be laid down there. In the morning, I have taken out from underneath one Turnip about 100 of these pests. Gold-fishes seem to be very fond of woodlice. In a vinery here is a cistern, in which there is a large fish; sometimes I put in a few woodlice, upon which the fish darts with devouring greediness, and splashes in the water with all the joy imaginable. When only one or two woodlice are put in, it seems greatly disappointed.—*A Gardener.*
